| Net debt decreased                                | ..                             | ..                             | ..                             | 148,413                        | 517,342                        | 817,131                        | 840,530                        | 977,842                        | 738,811                        |

<sup>1</sup> Adjustment—deduct.

<sup>2</sup> Adjustment—add.

In state and local finance the two most prominent features are (1) the remarkable growth of expenditures and debts after the War, due primarily to the demand for increased educational facilities and highway improvements; (2) the widespread movement for budgetary reform in the States. The latter, although strongly pressed has not, as yet completely passed beyond the experimental stage.

#### WEALTH AND INCOME

**Increase of Wealth.**—The increase in the total and *per capita* wealth in the United States since 1900 is shown by the table in the adjoining column.

#### Estimated National Wealth of the United States

|      | Total (in dollars)           | Per Capita |
|------|------------------------------|------------|
| 1900 | 88,517,000,000               | 1165       |
| 1904 | 107,104,000,000              | 1318       |
| 1912 | 186,300,000,000              | 1950       |
| 1922 | 320,804,000,000 <sup>1</sup> | 2935       |

Based on *The Statistical Abstract of the United States*, 1924, p. 271.

The table shows the increase in terms of dollars. The decline in the purchasing power of the dollar since 1900 accounts, in part at least, for the upward trend, and is a reflection of the cheapening of gold. Since this is a world-wide phenomenon it does not destroy the usefulness of these figures for purposes of comparison with other countries. All such comparisons are based on estimates which are generally not made by the same persons, and cannot, therefore, be taken as mathematically exact. The following table shows how the leading countries compare in total and *per capita* wealth at approximately the same dates.

The details of the estimate are as follows:—

*National Wealth, 1922*

| Items of Wealth                                                                     | Total value (in thousands of millions of dollars) | Per cent of total | Amount <i>Per Capita</i> |
|-------------------------------------------------------------------------------------|---------------------------------------------------|-------------------|--------------------------|
| Real property and improvements taxed                                                | \$155.9                                           | 48.6              | 1,427                    |
| Real property and improvements exempt                                               | 20.5                                              | 6.4               | 187                      |
| Live stock                                                                          | 5.8                                               | 1.8               | 53                       |
| Farm implements and machinery                                                       | 2.6                                               | 0.8               | 24                       |
| Manufacturing machinery, tools and implements                                       | 15.8                                              | 4.9               | 145                      |
| Railroads and their equipment                                                       | 20.0                                              | 6.2               | 183                      |
| Motor vehicles                                                                      | 4.6                                               | 1.4               | 42                       |
| Street railways                                                                     | 4.9                                               | 1.5               | 45                       |
| Telegraph systems                                                                   | .2                                                | 0.1               | 2                        |
| Telephone systems                                                                   | 1.7                                               | 0.5               | 15                       |
| Pullman and other cars not owned by railroads                                       | .5                                                | 0.2               | 5                        |
| Pipe lines                                                                          | .5                                                | 0.2               | 5                        |

Figures taken from *The Inter-Ally Debts* by Harvey E. Fisk, Bankers Trust Co., New York, 1924.

**Increase of Income.**—The significance of these figures is less than that of the estimates of the national and *per capita* income. It is the annual income of the people rather than the value of the property which they own that sets their standard of living and their material well-being.

The following table shows the estimated national and *per capita* incomes in various countries in 1914.

| Country         | Estimates based upon the work of     | National Income Millions of Dollars | <i>Per Capita</i> Income Dollars |
|-----------------|--------------------------------------|-------------------------------------|----------------------------------|
| United States   | National Bureau of Economic Research | \$33,200                            | \$335                            |
| United Kingdom  | Bowley, Stamp                        | 10,950                              | 243                              |
| Germany         | Helfferich                           | 10,460                              | 146                              |
| France          | Pupin                                | 7,300                               | 185                              |
| Italy           |                                      | 3,890                               | 112                              |
| Austria-Hungary |                                      | 5,350                               | 102                              |
| Spain           | Barthe                               | 1,120                               | 54                               |
| Australia       | Official, Knibbs                     | 1,260                               | 263                              |
| Canada          | Giffen                               | 1,460                               | 195                              |

Taken from *Income in the United States* vol. I, by the Staff of the National Bureau of Economic Research, Inc., Harcourt, Brace & Co., 1921.

**Diffusion of Wealth.**—Even more significant than the total or the *per capita* income of the various countries is the question of the diffusion of income. A high average income may go with widespread poverty if the few have immense incomes and the many very small incomes. It is important to know how evenly or unevenly the income is distributed or how widely actual personal incomes deviate from the average. This is a question that presents many difficulties to the statistician. Income-tax statistics throw some light on the question, wage statistics further light.

The table at top of p. 888, based on income-tax returns, shows the number of incomes of different classes in the United States, 1916-22.

The difficulty of reducing this table to a graph is insurmountable. However, the following tells a part of the story. In order to show incomes of a million or over on this scale, the curve would have to start several inches above the top of the page. At the same time the percentage of such incomes is so small, less than 0.002%, that it could not be shown on a graph without a microscope and a magnifying glass. Such a curve, however, would show the distribution of taxable incomes of \$20,000 or less.

S. N. Procopovitch in an able article in the *Economic Journal* for March 1926, makes some interesting comparisons of the degrees of inequality of incomes in different countries. Comparing the United States and Australia with Germany, he finds that the incomes of the wealthiest 0.5% of the population deviate less from the average in the two English-speaking countries than in Germany; during the World War, instead of increasing, as was the case in Germany, they declined. He also finds that of the incomes coming last in the table (his table covers only the wealthiest 20% of the population) 4 to 20% in the United States and Australia are definitely higher, on the average, than in Germany.

The following table shows his estimate of the inequalities of income of the richest 40% of the population in Prussia, Saxony, United States of America and Australia. The richest 10% have respectively incomes 5.6, 5.7, 5.5 and 5.8 times as large as the average income or budget unit. The incomes of the other 60% of the population, which would presumably fall below the budget unit, or the average, are not indicated.

| Percentage of Population | Prussia 1913 | Saxony 1912 | U.S.A. 1918 | Australia 1914-5 |
|--------------------------|--------------|-------------|-------------|------------------|
| 0-10%                    | 5.6          | 5.7         | 5.5         | 5.8              |
| 10-20%                   | 1.9          | 1.9         | 2.3         | 2.4              |
| 20-30%                   |              | 1.3         | 1.7         | 1.4              |
| 30-40%                   |              | 0.9         | 1.1         | 0.5              |

In the following table, he shows, in another form, the degrees of inequality in the United States, Australia and Saxony:—

|               | Coefficient of inequality | Income per head of population |
|---------------|---------------------------|-------------------------------|
| United States | 0.53                      | 557 dollars                   |
| Australia     | 0.64                      | 241 dollars                   |
| Saxony        | 0.70                      | 157 dollars                   |

For the distribution of incomes below the income-tax level we have no statistics. However, some idea of the general diffusion of prosperity among wage-workers may be gained from wage statistics. The following table shows, in the form of index numbers, based on the cost of food alone, comparative wages in a number of cities. Philadelphia, the only American city stands first.

Base: London, July 1 1924 = 100

| City       | Oct. 1 1925 | City            | Oct. 1 1925 |
|------------|-------------|-----------------|-------------|
| Amsterdam  | 81          | Paris           |             |
| Berlin     | 65          | Philadelphia    | 176         |
| Brussels   | 51          | Prague          | 49          |
| Copenhagen | 109         | Riga            | 45          |
| Lisbon     | 34          | Rome            |             |
| Lodz       | 54          | Stockholm       | 82          |
| London     | 94          | Sydney          | 133         |
| Madrid     | 56          | Tallinn (Revel) | 39          |

*Statistical Abstract, p. 259. 1925 figures supplied by American Bankers Association.*

*Building and Loan Associations*

| Date           | Associations | Members   | Assets (In thousand dollars) |
|----------------|--------------|-----------|------------------------------|
| 1910 . . . . . | 5,937        | 2,216,912 | 945,569                      |
| 1915 . . . . . | 6,806        | 3,334,899 | 1,484,206                    |
| 1920 . . . . . | 8,624        | 5,026,781 | 2,534,320                    |
| 1924 . . . . . | 11,844       | 8,554,352 | 4,795,937                    |

(By H. F. Cellarius, Cincinnati, Sec. of U.S. League of Local Building and Loan Associations.)

If we add together the premiums paid to life-insurance companies during the last five years and count them among recent savings, and then add to this sum the savings deposits and the assets of building and loan associations, we get an aggregate of about 35 billions of dollars in these popular forms of saving.

*Life Insurance (Outstanding Policies)*

| Date           | Number of policies (thousand policies) |            |       |        | Value of Outstanding Policies (in thousand dollars) |              |           |              |

(Statistical Abstract, p. 284.)

The last few years have witnessed a striking increase in the number of small investments in corporate securities. Mr. H. T. Warshaw (*Quarterly Journal of Economics*, Nov. 1924) has shown that the number of stockholders increased from about 4,400,000 in 1900 to about 14,400,000 in 1922, or about 250%. He shows further that an increasing percentage of all dividends paid by corporations goes to persons of small or moderate in-

FIG. 1.—Diagram showing the estimated national income in various countries, in 1914. (Based on figures given in table p. 887.)

comes, and a correspondingly decreasing proportion to persons with large incomes. Since 1916 especially, decreasing proportions of total dividends have been paid to persons with incomes of \$20,000 or above, constant proportions to those with incomes from \$5,000 to \$20,000 and increasing proportions to those with incomes under \$5,000.

Several years ago the number of labourers buying the shares of corporations began to be noticeable. In many cases this was merely a response to a selling campaign on the part of corporate managers, a campaign which was strikingly successful, and the employees surprised their employers by the avidity with which

they purchased the shares offered. In fact, some old and well-established industries have found that they need not go outside the circle of their own employees to raise any new capital needed for ordinary expansion. In at least one case, that of a large rapid-transit company, the employees own enough voting stock to hold the balance of power.

In 1924 the *Financial World*, by means of a questionnaire, found that in the cases of 104 of the leading corporations of the country, employees below the grade of officials owned stock. Of those only 54 had offered special inducements to persuade employees to buy stock. In one case 50,020 employees owned

FIG. 2.—Diagram showing the estimated income per head of population, in various countries in 1914. (Based on table p. 887.)

689,703 shares. In two other cases, 15,000 employees owned stock; 450,411 shares in one case and 200,000 shares in the other. Still another company reported that 12,000 of its 18,000 employees owned stock. Other sources of information show that corporations not included in those that replied to the questionnaire of the *Financial World* have sold considerable quantities of stock to their own employees. In Aug. 1921, the Metropolitan Life Insurance Co. published a report on Employees Thrift and Savings Plans which contains much valuable information. In one large motor company, 94% of the employees were buying stock on the instalment plan.

The following summary gives an analysis of the general increase in the number of shareholders of the leading American corporations between 1918 and 1925.

*Source of Increase in Stockholders—1925 over 1918*

| Industries                                                            | From Employees | From Customers | From General Public |

| Ten oil companies                                                     | 21,153         | 800            | 115,724             |
| Five iron and steel companies                                         | 87,696         | ..             | 4,530               |
| Ten high-grade miscellaneous manufacturing and distributing companies | ..             | ..             | 19,337              |
| Total                                                                 | 338,760        | 864,754        | 1,310,880           |

The growth of labour banks from nothing to their present dimensions has been a phenomenon of the last five years. The statement of Financial Condition of Labour Banks in the United States, Dec. 31 1925, gives the names of 36 labour banks and investment companies. The total capital of these banks on the above date was \$9,064,358; surplus and undivided profits, \$3,403,429; and total resources, \$114,894,305.<sup>1</sup>

*Productivity.*—The great natural resources of the United States help to explain the general prosperity of the country, but not the diffusion of that prosperity. The explanation is rather to be found in the way in which the human resources have been developed and utilised. Prof. Taussig (*Quarterly Journal of Economics*, Nov. 1924) has collected some significant evidence as to the product per worker in different countries in certain manufacturing and mining industries where comparison is possible. It appears that the product per worker is higher in the United States than in other countries. This higher product per worker in manufacturing industries cannot be shown to depend upon superior manufacturing sites. It is correlated with a larger quantity of engine-power and of power-driven machinery per worker. In the steel industry, for example, the total number of workers is very little greater in the United States than in Great Britain, though the total product in tonnage is more than twice as great. In other words, the product per man is about twice as great in the United States. The American industry uses almost exactly twice as much horse-power per man as the British. According to Sir Richard Redmayne the output of coal per worker (underground and above ground) in 1923 was as follows: United States, 693 tons; Great Britain, 229 tons; Germany (excluding brown coal) 103 tons and France 134 tons (see COAL).

The output per labourer is four times as great in the United States as in Japan. Also "a Japanese cotton-mill requires approximately four times as many employees for the same amount of machinery as does an American mill." Figures 3 and 4, which will be seen on the following page, show how the product and the power per worker have increased in iron and copper mining in the United States.

In agriculture, a comparison between Iowa and Bavaria was made, some years ago, by E. A. Goldenweiser. It appeared that in most crops except Indian corn, which is not a Bavarian crop, Bavaria produced more per acre, but Iowa produced nearly four times as much per person engaged in agriculture.

*The Reasons for American Prosperity.*—The conclusion is warranted that the higher wages per worker are a market expression of the fact that the product per worker is higher in the United States than elsewhere, and that the higher product, at least in manufacturing, and to a certain extent also in mining, is a result of superior equipment and direction. Why does the United States equip and direct its wage-workers more efficiently than other countries?

First among the factors in prosperity of the American people and its wide diffusion must be mentioned the democratic spirit or the absence of the spirit of caste. American democracy is not limited to the form of government: it is a spirit which permeates everywhere and determines the popular attitude toward men and careers. It recognises no basis for esteem except individual achievement. It presents an open road to talent wherever it exists, whether in the newly arrived immigrant, the child of a ditch digger, or the homes of the educated and the wealthy. The road from log cabin to White House is as open as that from the palatial home. That the son of a labourer may fill the highest position in any field is so much a matter of course as to occasion no surprise or comment.

This means, first of all, the fullest development of human resources. When a person who is capable of doing work of great importance is found doing work of less importance because of social handicap, that person's full productivity is not realised. When he is encouraged and enabled to do the most important work of which he is physically and mentally capable, he makes a greater contribution to the national life than he could have made

<sup>1</sup> Courtesy of Research Department, Amalgamated Clothing Workers of America.

under any other condition. When one who would otherwise have been an unskilled workman becomes a skilled workman, his productivity is increased. The same principle applies to every increase in skill or talent, however high in the social or economic scale the case is found. When such cases of increased productivity are numbered by the tens of millions, they count largely in the creation of national prosperity.

FIG. 3.—Diagram showing the yearly output of iron per worker employed at iron mines in the United States, and the horsepower used per man. The broken line should be read in connection with the vertical scale on the right, and the output per man, in connection with the vertical scale on the left.

Another factor of vast importance is that the country has no leisure class and that it is not the ambition of any typical American to retire from business as soon as he has accumulated a competency. Where the idea prevails, as to some extent it does in Great Britain, that the successful man should retire from business as soon as he can afford it, there will always be a scarcity of active talent of the highest grade. The more capable the man, the sooner he will be able to retire. The result would be that industries would be managed by young and untried men, or else by third- and fourth-rate men who never could accumulate enough on which to retire. Industry would be poorly managed, the product per man would be low, and by no possibility could high wages be paid.

Next in importance to the democratic spirit with its open road to talent—in fact a part of it—is the American system of popular and universal education. Until recently this had its fullest development in the northern and western states, where prosperity has been greatest and to which immigrants have preferred to come because in these states industry expanded most rapidly, the demand for labour was greatest and wages were highest. These results came, not because of superior natural resources in the North and West, but because there the available human resources were more fully developed and utilised than was the case in the southern states.

The question of prohibition is still a controversial question. Whatever may be said for or against it on other grounds, there cannot be much doubt that it is a factor in the diffusion of prosperity. In spite of the vast amount of bootlegging, the fact is that wage-workers are spending much less of their money on drink, because bootleg liquor is too expensive. Much of the wage-money formerly spent on drink is now spent on other articles; much of it also is saved and helps to explain the growing financial power of labour. More important is the effect of increasing sobriety among wage-workers on wage-rates. First, it increases the efficiency of labour. Second, it facilitates the promotions of the more capable into higher ranks, thus relieving the congestion in

the lower ranks of labour. Anything which relieves that congestion tends to raise wages.

The restriction of immigration, inefficiently as it is administered, and in spite of the many who are smuggled in, is a vital factor in the present prosperity of the American wage-workers. If, however, the United States had not been a good country for labourers, there would have been no immigration to restrict. It became a good country for labourers at an early day because of

FIG. 4.—Diagram showing the yearly output of copper per worker employed at copper mines in the United States and the horsepower used. Broken lines should be read in connection with the vertical scale on the right, and the output per man, in connection with the vertical scale on the left.

the gifts of free land and has become a still better country for labourers since the free land was exhausted, because of the factors mentioned above, which caused American industries to expand, which increased their product per man and enabled industries to pay higher wages than elsewhere. The restriction of immigration merely safeguarded the results which had been thus secured.

The principles of economics are, of course, universal. No country has a monopoly of any of them. The factors and forces that have made the United States prosperous and have diffused that prosperity will produce the same results wherever they are permitted to operate. Any country, up to the limit set by its physical resources, can prosper by the same methods and diffuse its prosperity to the same degree. The whole process may be summarised in a single formula: the fullest development of human resources by training every individual to the highest degree of skill and usefulness. This will not only increase the national dividend; it will, through the occupational redistribution of labour-power, increase those kinds of skill and talent that are now scarce, and correspondingly decrease those forms of labour that are now superabundant. A consistent pursuit of this policy will diffuse prosperity and abolish unemployment, low wages and poverty in any country, although not perhaps as completely as in the United States, where the conditions are so favorable to a rapid increase of wealth.

**BIBLIOGRAPHY.**—*Statistics of Income*, annually published by the Bureau of Internal Revenue, analyses in detail the Federal income returns. Of especial value for recent years are the annual reports and monthly bulletins of the Federal Reserve Board, and the monthly bulletins issued by the several district banks. The annual volume, *Statistical Abstract of the United States*, assembles data on money, banking and national wealth. The *Annual Report of the Secretary of the Treasury* contains a mass of information regarding the national wealth. See also W. I. King, *The Wealth and Income of the People of the United States* (1917), a scholarly analysis and interpretation of official statistics, and the publications of the National Bureau of Economic Research (New York). ## III. PRODUCTION, INDUSTRY AND TRADE

*The Land.*—During the decade 1910-20 the number of farms showed a slight gain, 1.4%. In 1920 there were 6,448,343, as compared with 6,361,502 in 1910. A comparison of these numbers with the total population shows that in 1910 there was one farm for every 14 of the population, and in 1920 one farm for every 16. According to the preliminary figures of the agricultural census in 1925, there was a decrease of 75,735 farms, or 1.2%, between 1920 and 1925. Between 1910 and 1920 the percentage of increase in population was 14.9, and for improved farm land 5.1. The number of acres *per capita* of total population in improved farm land in 1910 was 5.20; and in 1920, 4.76. The percentage of farm land improved for the total area of the United States in 1910 was 54.4; and in 1920, 52.6. The decrease in the number of farms was particularly marked in states east of the Mississippi; for example, in Connecticut, 15.5%; Massachusetts, 13.4%; New York, 10.5%; Ohio, 5.6%; and Illinois, 5.8%. In New England the number of farms decreased by 32,238, giving in 1920 one farm for every 47 persons. The total farm acreage increased somewhat more rapidly than the number of farms, from 878,798,325 ac. to 955,883,715 ac., nearly 8.8%. The greater portion of this increase was due to the use of land for dry farming in the arid states of the Rocky Mountain section and also to the enclosure of large areas for grazing. In 1919 there were 503,000,000 ac. under cultivation. One-half of the total land area of the United States was in 1920 included in farms, as compared with 46.2% in 1910. Of the 956,000,000 ac. included in farms, 105,012,000 in 1924 was devoted to corn; 54,209,000 to wheat; 76,385,000 to hay; 42,452,000 to oats; and 40,115,000 to cotton.

Nearly one-third of the farm area and nearly one-sixth of the total land area is used for the growing of these five products. The average size of farms slightly increased between 1910-20, from 138.1 ac. to 148.2 acres. Notwithstanding the small increase in the number of farms, and of acreage in farms, the value of all farms, lands and buildings increased from \$35,000,000,000 in 1910, to \$66,000,000,000 in 1920 or nearly 90%. This increase, however, was due largely to the abnormally high prices prevailing in 1920, rather than to new investments and improvement of property. For the same reason the average value of land and buildings per farm for the United States as a whole greatly increased, rising from \$5,471, in 1910 to \$10,284 in 1920. In 1910 62.1% of farms were owned by their cultivators, and in 1920 60.9%. In New England, New Jersey, New York and Pennsylvania, there was a decline in tenancy, but there was a marked increase in the Mountain and Pacific states. During the decade 1910-20 native white farmers increased from 4,721,063 to 4,917,386; foreign-born white farmers decreased from 669,556 to 581,068; coloured farmers increased from 920,883 to 949,889.

The United States is an agricultural country, but the question is frequently asked whether agriculture is keeping pace with the growth of the population. A comparison of the annual crop for the three-year period 1912-4 with that for the period 1922-4 for corn, wheat and oats gives the following:—

TABLE I. *Corn, Wheat and Oat Crops*

|       | Average 1912-4<br>bushels | Average 1922-4<br>bushels |
|-------|---------------------------|---------------------------|
|       | millions                  | millions                  |
| Corn  | 2,748                     | 2,799                     |
| Wheat | 795                       | 846                       |
| Oats  | 1,227                     | 1,355                     |

A comparison of these figures with the population at the respective dates shows that the *per capita* product was slightly less for all three in 1920 than in 1910. Table II. shows the estimated annual crop of some of the most important agricultural staples.

The annual production of cotton from 1910-9, which did not greatly change in this decade, averaged 13,200,000 bales. In 1916 a record crop of 16,000,000 bales was reached. The five years 1920-4, however, showed a decline to an annual average of less than 11,000,000 bales. Domestic consumption slowly increased until 1924, leaving a smaller amount for export, and from 1910-4 the annual average export was 8,811,000 bales,

TABLE II. *Annual Crops (In Millions)*

|      | Corn<br>(bu.) | Wheat<br>(bu.) | Oats<br>(bu.) | Cotton<br>(bales) | Irish<br>potatoes<br>(bu.) | Tobacco<br>(lb.) | Wool<br>(lb.) |
|------|---------------|----------------|---------------|-------------------|----------------------------|------------------|---------------|
| 1910 | 2,886         | 635            | 1,186         | 11.6              | 349                        | 1,103            | 321           |
| 1915 | 2,995         | 1,026          | 1,549         | 11.2              | 360                        | 1,062            | 286           |
| 1916 | 2,567         | 636            | 1,252         | 11.4              | 287                        | 1,153            | 288           |
| 1917 | 3,065         | 637            | 1,593         | 11.3              | 442                        | 1,249            | 282           |
| 1918 | 2,503         | 921            | 1,538         | 12.0              | 412                        | 1,439            | 299           |
| 1919 | 2,811         | 968            | 1,184         | 11.4              | 323                        | 1,465            | 298           |
| 1920 | 3,209         | 833            | 1,496         | 13.4              | 403                        | 1,582            | 278           |
| 1921 | 3,069         | 815            | 1,078         | 8.0               | 362                        | 1,070            | 274           |
| 1922 | 2,906         | 868            | 1,216         | 9.8               | 453                        | 1,247            | 261           |
| 1923 | 3,054         | 797            | 1,306         | 10.1              | 416                        | 1,515            | 267           |
| 1924 | 2,437         | 873            | 1,542         | 13.2              | 455                        | 1,243            | 282           |

and from 1915-9, 6,310,000 bales, or a decline of 28%. In the five years 1920-4 the average export was 6,138,000 bales, a further decline of 3%. The production of wool also remained fairly constant, approximately 300,000,000 lb. annually. Imports in the years 1915-24 were larger than in the preceding decade, and the total consumption therefore larger, as exports were insignificant. The average annual consumption, domestic and foreign, 1921-4 was 590,000,000 lb., as compared with 508,000,000 lb. in 1911-5. With the exception of two years, 1920 and 1924, the United States since 1914 has been dependent on foreign countries for more than one-half its wool consumption, as compared with two-fifths or even one-third in the earlier years of the century.

Strenuous efforts were made during the World War period, even before the entry of the United States, to increase the production of wheat. In 1916 the average farm value per bushel for the first time since the decade following the Civil War was above \$1, and in 1919 was as high as \$2.15. A record crop was produced in 1915 amounting to over a thousand million bushels. The average annual production for the five years 1910-4 was 697,000,000 bu., 1915-9, 822,000,000 and in 1920-4, 837,000,000 bushels. This gives an average annual increase of 140,000,000 bu.; on the basis of an annual *per capita* consumption of five bushels this provides bread for 28,000,000 additional people. In the years 1915-9 the average annual export was 240,000,000 bu., and in 1920-3, 256,000,000 bushels.

The domestic beet-sugar industry during the ten years 1910-9 became firmly established. In 1917 the volume of beet sugar production was less than that of cane sugar. In later years it has been far in excess. The production, in millions of pounds, was 1,775 in 1910 (cane, 750; beet, 1,025); 1,697 in 1920 (cane, 244; beet, 1,453); and 2,086 in 1924 (cane, 324; beet, 1,762). The outlying possessions of the United States (Porto Rico and the Philippine Is.) provide an amount of sugar greater than that produced at home. However, the United States is still dependent upon foreign countries for more than half its needs. The annual *per capita* production of sugar was approximately 100 lb. in 1924, as compared with 70 lb. in 1900.

The crops of hay, sweet potatoes, rye, barley and rice, with their farm values, are seen in Table III.

TABLE III. *Hay and Other Crops*

|                      | 1924     |            | 1910     |            |
|----------------------|----------|------------|----------|------------|
|                      | Amount   | Farm Value | Amount   | Farm Value |
|                      | millions | millions   | millions | millions   |
| Hay (tons)           | 112      | \$1,468    | 69       | \$842      |
| Sweet potatoes (bu.) | 72       | 92         | 60       | 40         |
| Rye (bu.)            | 63       | 68         | 35       | 25         |
| Barley (bu.)         | 188      | 137        | 174      | 100        |
| Rice (bu.)           | 34       | 47         | 25       | 17         |

In 1924 the production of apples was 179,443,000 bushels. The peach crop amounted to 51,679,000 bushels. Approximately 2,300,000 were devoted to truck crops.

The number of cattle on farms, as reported by the Bureau of the Census; in 1924 was 66,506,000 (as compared with 61,804,000 in 1910). This increase did not keep pace with the growth in population. The number of swine in 1925 (preliminary) was

54,234,000, as against 58,186,000 in 1910. The number of sheep fell off from 52,448,000 in 1910 to 39,134,000 (preliminary figure) in 1925. The wool crop in 1924, according to the Dept. of Agriculture, was 282,330,000 lb. as compared with the maximum 318,548,000 lb. in 1911. In 1924 the wool product of Wyoming was 19,760,000 lb.; Idaho, 16,800,000 lb.; Montana, 19,314,000 lb.; Utah, 16,884,000 lb.; New Mexico, 12,408,000 lb.; Texas, 22,223,000 lb.; Ohio, 13,899,000 pounds. (These latter figures are preliminary.)

The Dept. of Agriculture in its *Year Book* of 1918 estimates that 350,000,000 ac., or nearly one-fifth of the land area of the United States, is too rough or hilly for the successful cultivation of crops. It may, however, be adapted to the growth of forests, or used for grazing purposes. Nearly one-third of the land area, or 600,000,000 ac., receives insufficient rainfall for the profitable production of crops at normal prices, and affords no possibility of irrigation. A total of 40,000,000 ac. is absolute desert. It is estimated that 200,000,000 ac. of forest, "cut-over" land, and woodland including that in farms, could be used for crops after clearing. This, if divided into farms averaging 160 ac., would provide 1,250,000 farms, or an addition of about 20% to the number of farms in the country. Moreover, 60,000,000 ac. of swamp land can be drained, and 30,000,000 ac. of potentially irrigable land can be converted into farms if available sources of water supply are fully utilised. In all there are about 850,000,000 ac. of land at present in crops and potentially available. A little over 1,000,000,000 ac. of non-arable land consist of 360,000,000 ac. of absolute forest land, 615,000,000 ac. of grazing land, 40,000,000 ac. desert land and 40,000,000 ac. in cities, roads and railway rights of way. It is also estimated that 360,000,000 ac. of forest will not be sufficient to supply a population of 150,000,000, but that 450,000,000 ac. will be needed for that number. To provide food, therefore, more intensive methods of farming will be required. For corn the average yield per ac. in the five years 1900-04 was 24.2 bu., and in 1919-23, 29.5 bushels. The yields for wheat were 13.4 and 13.3 bu.; for oats 31 and 29.9 bu.; and for barley 25.7 and 23.6 bu., respectively, for the two periods in question.

*Manufactures.*—A quinquennial census of manufactures was taken between 1899 and 1919. Beginning with 1921 data are collected every two years; as the returns for 1921 and 1923 did not include establishments having products valued at less than \$5,000, subsequent years are not strictly comparable with those antecedent. Although small establishments having products less than \$5,000 constitute in 1921 21% of the total number of establishments, the number of wage-earners, and value of products in this class were less than 1%, and comparison of 1921 with previous years given in Table IV. is fairly accurate except as to number of establishments. Figures for values, however, were greatly affected by the change in the general level of prices and wages between 1914 and 1919.

TABLE IV. *Manufactures*

|          | Establishments | Wage-earners | Value of products | Value added by manufacture |
|----------|----------------|--------------|-------------------|----------------------------|
| 1909 . . | 268,491        | 6,615,046    | \$20,672,052,000  | \$8,529,261                |
| 1914 . . | 275,791        | 7,036,247    | 24,246,435,000    | 9,878,346                  |
| 1919 . . | 290,105        | 9,096,372    | 62,418,079,000    | 25,041,698                 |
| 1921 . . | 196,267        | 6,946,570    | 43,653,283,000    | 18,316,666                 |
| 1923 . . | 196,309        | 8,778,156    | 60,555,998,200    | (not available)            |

The great increase between 1914 and 1919 was due to the expansion of manufacturing activity and change in prices, occasioned by the World War. For wage-earners the percentage of increase was 29.3%; for value of products, 157.4; and for value added by manufacture, 153.5.

Arranged by the 14 general groups of industries according to the classification of the Bureau of Census Table V. shows number of wage-earners, capital invested and value of products in 1923.

TABLE V. *Groups of Industries, 1923*

| Group                                                         | Wage-earners | Value of product in millions of dollars |
|---------------------------------------------------------------|--------------|-----------------------------------------|
| Food and kindred products . . . . .                           | 682,137      | 9,524                                   |
| Textiles and their products . . . . .                         | 1,719,434    | 9,487                                   |
| Iron and steel and their products . . . . .                   | 892,660      | 6,829                                   |
| Lumber and its manufactures . . . . .                         | 931,748      | 3,633                                   |
| Leather and its finished products . . . . .                   | 344,545      | 1,880                                   |

| Chemicals and allied products . . . . .                       | 384,493      | 5,707                                   |
| Stone, clay, and glass products . . . . .                     | 347,619      | 1,539                                   |
| Metals and metal products other than iron and steel . . . . . | 296,911      | 2,634                                   |
| Tobacco manufactures . . . . .                                | 146,337      | 1,044                                   |
| Transportation equipment, air land and water . . . . .        | 606,328      | 5,333                                   |
| Railroad repair shops . . . . .                               | 523,430      | 1,520                                   |
| Miscellaneous industries . . . . .                            | 271,815      | 1,687                                   |
| All industries . . . . .                                      | 7,674,252    | 54,587                                  |

In 1919 ten cities: New York, Chicago, Philadelphia, Detroit, Cleveland, St. Louis, Baltimore, Buffalo, Boston and Pittsburgh, with a combined population of approximately 15,300,000, or about 14% of the total population, manufactured 27% of the total product value. Some manufacturing industries tend toward local concentration; for example in 1921, measured by value of product, Michigan produced 47.6% of the products of the motor-vehicle industry in the United States; Massachusetts, 33% of the boot and shoe industry; Connecticut, 30.6% of brass, bronze, and copper products, and 59.5% of ammunition; California, 47.6% of canning and preserving fruits and vegetables; Illinois, 41% of the agricultural implement industry; New York, 43% of men's clothing, 76% of women's clothing, and 59% of leather gloves and mittens.

The total value of product in 1919 was nearly three times that of 1914, increasing in dollars from 24 billion to 62 billion due to abnormal war activity and change in value of monetary unit; in 1921 there was a decline to 43.7 billion dollars. Table VI. shows the product of specific industries in 1923, with a comparison for 1914.

TABLE VI. *Individual Industries*  
(Production in millions of dollars)

|                                                                                     | 1923  | 1914  |
|-------------------------------------------------------------------------------------|-------|-------|
| Boots and shoes . . . . .                                                           | 1,000 | 502   |
| Bread and other bakery products . . . . .                                           | 1,123 | 492   |
| Cars and general shop construction and repairs by steam railway companies . . . . . | 1,434 | 514   |
| Clothing, men's . . . . .                                                           | 1,179 | 458   |
| Clothing, women's . . . . .                                                         | 1,407 | 474   |
| Confectionery and ice cream . . . . .                                               | 626   | 210   |
| Cotton goods . . . . .                                                              | 1,901 | 677   |
| Electrical machinery, apparatus, and supplies . . . . .                             | 1,293 | 335   |
| Flour-mill and grist-mill products . . . . .                                        | 1,049 | 878   |
| Foundry and machine-shop products . . . . .                                         | 2,338 | 867   |
| Furniture . . . . .                                                                 | 776   | 266   |
| Iron and steel, steel works, and rolling mills . . . . .                            | 3,154 | 919   |
| Knit goods . . . . .                                                                | 848   | 259   |
| Lumber and timber products . . . . .                                                | 1,494 | 715   |
| Motor vehicles . . . . .                                                            | 3,163 | 503   |
| Paper and wood pulp . . . . .                                                       | 907   | 332   |
| Petroleum refining . . . . .                                                        | 1,794 | 396   |
| Printing and publishing, book and job . . . . .                                     | 738   | 307   |
| Printing and publishing, newspapers and periodicals . . . . .                       | 1,268 | 496   |
| Rubber goods . . . . .                                                              | 958   | 301   |
| Silk goods, including throwsters . . . . .                                          | 761   | 254   |
| Slaughtering and meat-packing . . . . .                                             | 2,586 | 1,454 |
| Worsted goods . . . . .                                                             | 698   | 276   |

In order to show how far the increases given in Table VI. were due to higher prices and how far due to greater volume of production, the following figures are presented showing quantity production in 1914 and 1921 with respective values at each date.

In the silk industry there was manufactured in 1914, 216,000,000 yd. of broad silk, and in 1921, 273,600,000 yd.; the value nearly trebled from \$137,720,000 to \$341,000,000. Pig-iron production declined from 23,270,000 tons to 16,618,000 tons, but the value increased from \$312,762,000 to \$408,582,000; window-glass decreased in quantity from 401,000,000 sq. ft. to 265,000,000 sq. ft., but the value increased from \$17,496,000 to \$24,026,000. Fertilisers decreased in quantity from 8,432,000 tons to 5,994,000 tons, but owing to higher prices they gained in value from \$153,000,000 to \$175,000,000.

In food products condensed and evaporated milk doubled in quantity from 873,000,000 lb., to 1,759,000,000 lb., while the value nearly trebled from \$58,747,000 to \$158,890,000; beet sugar increased in quantity from 743,000 tons to 1,030,000 tons, and the value from \$58,590,000 to \$128,363,000; wheat flour decreased from 116,404,000 bbl. to 110,846,000 bbl., but increased in value from \$548,000,000 to \$872,000,000. The growing demand for automobiles greatly expanded not only their manufacture, but also the refining of petroleum, and the rubber industry. The number of passenger cars manufactured in 1923 was 3,432,308, as compared with 569,000 in 1914 for all motor vehicles. The petroleum-refining industry showed a phenomenal development due, in large part at least, to the immense increase in the number of motor vehicles.

The output of gasoline increased in seven years from 1,195,000,000 gal. to 5,098,000,000 gallons. The increase in quantity was more than four-fold and in value eight-fold. The manufacture of rubber goods greatly expanded, increasing from a value of \$301,000,000 in 1914 to \$958,518,000 in 1923. In the latter year, \$569,041,000 represented tires. The maximum production of lumber was reached in 1909, 44,510,000,000 ft.; in 1923 it was 37,166,000,000 ft., the decline being due to the fact that readily available timber was becoming less and less accessible. Portland cement is manufactured in larger amounts and has a wide use in the building industry. During the years 1900-9 the average production was 33,000,000 bbl.; in 1924 it reached 148,859,000 barrels. The production of tin plates,terne plates and taggers tin showed a steady development; in 1910 the output of tin plate was 1,410,000,000 lb., and in 1924, 2,975,000,000 pounds. An export trade was developed, the export of domestic tin plate,terne plate and taggers tin rising from an annual average in the years 1910-4 to 109,706,000 lb., to 507,159,000 lb. in 1920, and 360,633,000 lb. in 1924; import of this product has practically disappeared.

The cost of new buildings in the principal cities is estimated by the U.S. Geological Survey (by the Bureau of Labour Statistics beginning with 1920) as follows: 1910, \$726,000,000; 1915, \$700,413,000; 1920, \$1,343,000,000; 1924, \$3,216,000,000. The figures show that, although the War checked building, the total value of the buildings constructed immediately after was much greater; costs were swollen by high prices and increased wages and do not accurately represent the volume of new building measured by physical units.

After 1909 there was but a slight increase in the number of manufacturing establishments, notwithstanding the gain in the number of wage-earners and value of product. Excluding factories with product valued at less than \$5,000, in 1914 there were 177,110 establishments, with 6,896,190 wage-earners, and products valued at \$23,988,000,000, or \$135,440 per establishment; in 1919, 214,383 establishments, with 9,000,059 wage-earners, and products valued at \$62,042,000,000, or \$289,398 per establishment; in 1923, 196,309 establishments, with 8,778,950 wage-earners, and products valued at \$60,555,998,000, or \$308,472 per establishment. Of the 12,818,524 persons engaged in manufacturing and mechanical industries in 1920, 10,888,183, or 85%, were males, and 1,930,341, or 15%, were females.

#### THE OUTPUT OF MINERALS

The value of the output of mineral products, as estimated by the U.S. Geological Survey, increased from \$1,987,844,000 in 1910 to \$6,981,340,000 in 1920, and \$5,318,000,000 in 1924. Nearly three-fourths was represented in 1923 by six products,

as follows (in millions of dollars): bituminous coal, 1,636 (469 in 1910); pig-iron, 936 (412 in 1910); petroleum, 931 (128 in 1910); anthracite coal, 492 (160 in 1910); copper, 211 (137 in 1910); cement, 260 (69 in 1910). Lead increased in value from \$33,055,000 in 1910 to \$76,138,000 in 1923; zinc from \$27,268,000 to \$69,134,000; aluminium from \$8,956,000 to \$28,305,000; and natural gas from \$70,756,000 to \$250,000,000. Platinum had a remarkable development, the product increasing from 8,665 oz., valued at \$479,000 in 1915, to 66,007 oz., valued at \$7,611,000 in 1924.

The production of iron-ore increased from 57,015,000 long tons in 1910 to a maximum record of 75,289,000 tons in 1917. After the War it fell to 29,491,000 tons in 1920, and recovered to 70,018,000 tons in 1923. More than half of the iron-ore produced is mined in Minnesota, amounting in 1923 to 44,498,000 tons, followed by Michigan, 14,312,000 tons; Alabama mined 6,837,000 tons. In 1912 the National Conservation Commission estimated the total supply of iron profitable to mine at 4,784,930,000 long tons, and 75,000,000,000 tons not worth mining. According to this estimate, the profitable ore deposits might be exhausted in 60 years, allowing for no increase in national rate of production. The ore deposits being worked in 1923 were for the most part in high surfaces in the region of the Great Lakes. (See IRON and STEEL.)

The production of anthracite coal in 1910 was 75,433,246 tons (of 2,240 lb.); in 1920, 79,998,000 tons, and in 1923, 85,218,000 tons, an increase of 13% over 1910, or about 1% per annum. The estimated production in 1924 was 90,214,000 tons. The bituminous coal production in 1910 was 417,111,142 short tons, as compared with 545,000,000 tons in 1923, a gain of over 2% per annum. The estimated production in 1924 was 483,280,000 tons. About two-thirds of the coal consumed goes into the production of power, about equally divided between the industries and transportation; about one-sixteenth is used in raw material for making products employed industrially as coke, gas, coal-tar products; about one-sixteenth for heating homes and for buildings. (See COAL.)

The mining of copper does not follow a regular ascending curve of production. It reached a high point in 1906, 409,735 long tons; declined in 1907; rose to 487,925 tons in 1909; again declined in 1910; rose to 555,031 tons in 1912; fell to 513,454 in 1914; again advanced to 860,648 tons in 1916; declined to 225,708 in 1921, due to lack of European demand, and in 1923 recovered to 640,625 tons. More than one-third is produced in Arizona, the principal producing state. In 1924 it was estimated that the world's production was 1,499,143 short tons. (See COPPER.)

The increased demand for gasoline for automobiles raised the price and led to efforts to discover new supplies of petroleum. Since 1910 the production in California nearly trebled; in Texas it trebled; in Oklahoma more than doubled; in Wyoming new oil-fields were opened. The total production in 1924 was 707,265,000 bbl. as against the annual average yield of 363,000,000 for the years 1916-20, and 179,000,000 in 1908. (See PETROLEUM.)

The Director of the U.S. Geological Survey estimated in 1920 that the country's oil reserves were over 40% exhausted and that the supply at the existing rate of consumption would be exhausted within 20 years. Attention has been turned to the possibility of extracting petroleum from the oil shales of Utah, Colorado and Wyoming. Petroleum ranks second only to coal in value among mineral products.

The volume of natural gas products has risen steadily since the beginning of the century. In 1910 the production was 509,000,000 cu. ft., in 1920, 798,000,210 cu. ft., and in 1923, 1,800,135,000 cu. feet. Natural gas is found in 24 states, but chiefly in West Virginia, Pennsylvania, Ohio, Oklahoma and California. More than 3,000,000 domestic consumers are supplied. One-third is used for domestic purposes and two-thirds for industrial plants. The production in 1910 and 1923 is shown in Table VII. The total value of yield increased from \$71,000,000 in 1910 to \$250,000,000 in 1923.

TABLE VII. *Natural Gas Production*  
(In million cubic feet)

| State               | 1923      | 1910    |
|---------------------|-----------|---------|
| West Virginia       | 203,867   | 191,000 |
| Pennsylvania        | 112,562   | 127,000 |
| New York            | 6,497     | 6,000   |
| Ohio                | 53,812    | 48,000  |
| Arkansas            | 24,215    |         |
| Louisiana and Texas | 186,566   | 8,000   |
| Kentucky            | 11,953    |         |
| Illinois            | 4,049     | 7,000   |
| Oklahoma            | 203,082   | 50,000  |
| Kansas              | 32,072    | 59,000  |
| California          | 131,434   | 3,000   |
| Wyoming             | 35,523    |         |
| Other states        | 2,503     | 10,000  |
| Total               | 1,008,135 | 509,000 |

The production of gold reached its maximum in 1915, valued at \$101,035,700. During the War it declined, owing to advance in material and labour, and the decreased purchasing power of gold. (See GOLD.) In 1922 the production was valued at \$48,849,100, less than in any year since 1896. In 1924 production slightly gained to a value of \$51,912,000. California furnished \$631,000 oz. fine; Colorado, \$409,000; Alaska, \$301,000; South Dakota, \$297,000. Silver reached its maximum in 1911, showing a commercial value of \$66,485,000; in 1923 the value was \$60,135,000. Preliminary figures for 1924 show a further fall to \$43,540,000. Montana and Utah in recent years have forged ahead as great silver-producing states, Nevada remaining stationary.

**Fisheries.**—According to an estimate made by the Bureau of Fisheries the annual fishery product during the decade 1910-9 amounted to 2,500,000,000 lb., valued at about \$80,000,000. The industry employs about 200,000 persons. The total quantity of fish landed at Boston and Gloucester, Mass., and Portland, Me., the three principal fishing ports in New England, amounted in 1924 to 182,948,000 lb., having a value to the fishermen of \$6,992,952. Cod represented \$2,138,306 and haddock \$2,308,605. The product of the fisheries of the Great Lakes in 1917 was 104,269,000 lb., valued at \$6,295,000. One-half of the product, 53,529,000 lb., was ciscoes (whitefish). The product of the fisheries of the gulf states in 1918 was 130,924,000 lb., valued at \$6,510,000. The principal products were: mullet, 28,641,000 lb.; shrimp, 27,143,000 lb.; and oysters, 23,754,000 lb. At Seattle, Wash., the fishing fleet landed, in 1924, 28,233,000 lb., valued at \$2,719,222. The principal product was halibut. The total catch of salmon and steelhead trout on the Pacific coast in 1919 including Alaska was 767,000,000 pounds. It is estimated that the annual yield of oysters for the whole United States is about 30,000,000 bu., giving a return to the fishermen of nearly \$15,000,000. About one-fifth, 5,942,000 bu., come from the coast of the Middle Atlantic states.

**Production.**—Prof. Edmund E. Day of Harvard made an ingenious statistical study of the physical volume of production in the United States for the period 1888-1919, published in *The Review of Economic Statistics* (Harvard University, Sept. 1920-Jan. 1921), and continued by the Harvard Economic Service through the year 1924. The conclusions are shown in Table VIII. With 1899 as the base (100), index numbers for subsequent years were calculated for agriculture, representing 12 important crops—for mining, representing 10 minerals—and for manufacturing, representing 12 groups, covering 34 branches of manufacture. The indices for population are added in order to compare the growth of production.

Table VIII. shows that the physical volume of agricultural production has closely followed the growth of population. As Prof. Day points out: "Mining output, on the other hand, completely out-distanced population growth. Since 1897 the development of mining has been phenomenal . . . Crops are an annual harvest from a soil the fertility of which scientific cultivation carefully preserves; mineral production is a continuing exhaustion of irreplaceable natural deposit. Mining

TABLE VIII. *Index Numbers of Production*

| Year | Population | Agriculture | Mining | Manufacture |
|------|------------|-------------|--------|-------------|
| 1899 | 100        | 100         | 100    | 100         |
| 1900 | 102        | 101         | 106    | 101         |
| 1901 | 104        | 89          | 115    | 112         |
| 1902 | 106        | 114         | 123    | 122         |
| 1903 | 108        | 105         | 135    | 124         |
| 1904 | 110        | 116         | 136    | 122         |
| 1905 | 112        | 118         | 162    | 143         |
| 1906 | 115        | 125         | 170    | 152         |
| 1907 | 117        | 112         | 186    | 151         |
| 1908 | 119        | 119         | 154    | 126         |
| 1909 | 121        | 118         | 189    | 155         |
| 1910 | 123        | 122         | 208    | 159         |
| 1911 | 125        | 115         | 207    | 153         |
| 1912 | 127        | 137         | 221    | 177         |
| 1913 | 130        | 121         | 237    | 184         |
| 1914 | 132        | 137         | 225    | 169         |
| 1915 | 133        | 144         | 239    | 189         |
| 1916 | 135        | 126         | 269    | 225         |
| 1917 | 137        | 134         | 288    | 227         |
| 1918 | 138        | 135         | 289    | 223         |
| 1919 | 140        | 137         | 257    | 218         |
| 1920 | 142        | 150         | 293    | 231         |
| 1921 | 144        | 124         | 233    | 179         |
| 1922 | 146        | 138         | 254    | 240         |
| 1923 | 148        | 138         | 348    | 283         |
| 1924 | 150        | 139         | 322    | 262         |

typically lives upon its capital; agriculture upon its income. The rate of production in mining is consequently open to an acceleration which in agriculture is altogether impossible . . . The fluctuations of manufacturing output appear to be much more cyclical than the variations in agricultural production. In general the fluctuations of production in manufacture resemble closely those in mining."

**BIBLIOGRAPHY.**—See *Fourteenth Census of the United States 1920*, vol. V., VI., *Agriculture*; vol. VIII.-X., *Manufactures*, vol. XI., *Mines and Quarries*. The *Biennial Census of Manufactures 1921*, appeared in 1923, and *The Biennial Census of Manufactures 1923* in 1925. The annual volume *Mineral Resources of the United States* contains the bulletins of the Geological Survey of the Dept. of the Interior. Statistics of commerce are analysed in the *Commerce Yearbook* published by the Dept. of Commerce. The U. S. Tariff Commission has published several volumes in which commercial statistics are re-arranged for use in tariff discussion, e.g., *The Wool-Growing Industry*. Price statistics for retail and wholesale trade are gathered and published by the Federal Bureau of Labour Statistics. A valuable series of studies on price statistics of different groups of commodities during the World War was published under the editorship of W. C. Mitchell by the War Industries Board under the titles *History of Prices during the War* and *Government Control over Prices*. The Bureau of Labour Statistics also issues frequent bulletins showing wages in different trades in different parts of the country. See also the annual reports and the monthly bulletins of the Federal Reserve Board which contain a large variety of commercial and trade statistics, more detailed data on which may be found in the monthly bulletins of the several district banks. The *Statistical Abstract of the United States* assembles data on agriculture, fisheries, forestry, manufactures, mines and shipping. See also Raymond Pearl, *The Nation's Food* (1920); and W. M. Parsons, *Indices of General Business Conditions* (1919).

#### TRADE WITH FOREIGN COUNTRIES

Extraordinary movements in foreign commerce, due to the World War, began with 1915. During the years 1900-9, inclusive, the excess of exports over imports of merchandise varied in value from a maximum of \$666,000,000 in 1908 to a minimum of \$188,000,000 in 1910. Beginning with 1915 the annual excess was over a thousand million dollars, reaching in 1919, \$4,016,000,000. Gradually there was a return to pre-War balances, showing \$375,000,000 in 1923 but rising to \$981,000,000 in 1924. Table I. shows the movement by years, and the excess of exports over imports in each year.

The excess of exports over imports in trade with European countries was even greater than the balance from total trade with all countries, amounting in 1919 to \$4,437,000,000. In 1924 this balance was lowered to \$1,348,134. Trade with South America uniformly showed an excess of imports over exports

TABLE I. *Foreign Trade*  
(in millions of dollars)

|      | Exports | Imports | Excess of<br>Exports over<br>Imports |
|------|---------|---------|--------------------------------------|
| 1910 | 1,745   | 1,557   | 188                                  |
| 1911 | 2,049   | 1,527   | 522                                  |
| 1912 | 2,204   | 1,653   | 551                                  |
| 1913 | 2,466   | 1,813   | 653                                  |
| 1914 | 2,365   | 1,894   | 471                                  |
| 1915 | 2,769   | 1,674   | 1,094                                |
| 1916 | 4,333   | 2,198   | 2,136                                |
| 1917 | 6,290   | 2,659   | 3,631                                |
| 1918 | 5,920   | 2,946   | 2,974                                |
| 1919 | 7,920   | 3,904   | 4,016                                |
| 1920 | 8,228   | 5,278   | 2,950                                |
| 1921 | 4,485   | 2,509   | 1,976                                |
| 1922 | 3,832   | 3,113   | 719                                  |
| 1923 | 4,167   | 3,792   | 375                                  |
| 1924 | 4,591   | 3,610   | 981                                  |

ranging from \$73,700,000 in 1911 to \$252,800,000 in 1918, \$151,406,000 in 1924; and trade with Asia also gave adverse balances ranging from \$128,000,000 in 1911 to \$416,766,000 in 1924. The figures given here relate to values of exports and imports, and do not even approximately reflect the changes in the physical volume of foreign commerce. For some of the commodities recorded in official statistics of exports and imports it is possible to give quantities as well as values; for others only values. In order to illustrate the influence of prices on abnormal values of commodities entering into foreign trade during the war period, quantities are given in Table II. of exports for five commodities: wheat, cotton, bacon, mineral oil and tobacco; for other principal commodities only values are stated. Table III. shows the similar influence of change in price level on imports.

The enormous excess of exports of merchandise over imports, which began to be so marked in 1915, resulted in unprecedented gold transfers to the United States. In 1916 the import of gold

exceeded the export by \$403,759,000, and in 1917 by \$685,255,000. Thus in two years the gold holdings were increased by \$1,089,000,000. In the years 1918-20 \$436,532,000 of this gold was exported, leaving a net additional balance of \$652,000,000. In the years 1921-4 the flow of gold to the United States amounted in excess of exports to \$1,587,882,000.

**BIBLIOGRAPHY.**—Statistics of commerce are compiled by the Dept. of Commerce and published in two annual volumes, *Foreign Commerce and Navigation*, and *The Commerce Yearbook*. The annual volume, *Statistical Abstract of the United States*, also published by the Dept. of Commerce, contains valuable data on foreign commerce. A useful statistical handbook is *The Financial Review*, an annual published by the *Commercial and Financial Chronicle*, New York.

(D. R. D.)

#### AGRICULTURE IN THE UNITED STATES

In the United States agriculture is in the hands of 6,400,000 farmers; a number which has not changed appreciably between 1910 and 1926.

**Effect of the War.**—The outbreak of war in 1914 caused a violent disturbance of the price relationships of American agricultural products. In general, prices advanced; but for cotton, particularly, the market was demoralised. As the struggle progressed commodity prices rose sharply and production of exportable foodstuffs was greatly stimulated. During the last two years of the War and the year following, prices ruled very high, and this condition was accompanied by expanding credit facilities and a marked increase in the price of land. The economic reaction which set in during 1920 affected agriculture very severely. Demoralised financial conditions in Europe resulted in sharp reductions in the prices of agricultural exports, and these affected directly the prices of the vastly larger volume of these same commodities consumed at home. After many months of uncertainty and distress, conditions began slowly to mend so that at the close of the period there were evidences of definite improvement.

The major agricultural industries of the United States include the production of cereals or breadstuffs, hay and forage,

meat and wool, dairy products, fruits and vegetables, sugar, tobacco, cotton and forest products, in which are included lumber, naval stores and paper. Some of these industries are rather definitely localised to one or more sections of the country, while others are contributed to from nearly every section. In the 15 years between 1910 and 1925, there have been no significant changes in the relative importance of these industries except possibly in the group of fruits and vegetables where there appears to have been a marked increase in certain classes.

**Cereals.**—The production of cereals is carried on to some extent in nearly every part of the country, but is of major importance in the Mississippi Valley and westward to the Pacific coast. These crops occupy approximately 225,000,000 ac. each year, of which nearly half is devoted to corn or maize. The total cereal crop of the country fluctuates annually, mainly owing to climatic conditions, and during the period under review it has ranged from 125,000,000 to 150,000,000 tons. One new cereal crop, grain sorghum, has been added to the list in recent years. It occupies about 5,000,000 ac. each year, chiefly in the southern Great Plains and in the irrigated southwest, where it has proved a safer crop than maize under arid conditions. Improved varieties of winter wheat have made it possible to extend this crop further northward than it was formerly grown. Rice production, formerly confined to the central gulf coast region, has been established also in California.

**Hay.**—Hay and related forage crops occupy about 70,000,000 ac. and yield approximately 100,000,000 tons each year. One new hay crop, sudan grass, has come into use in recent years. It is a species of sorghum, closely related to Johnson grass, and grown chiefly in the southern Great Plains region. In the dairy sections, maize stored as silage is an increasingly important fodder crop.

**Meat.**—The production of meat includes cattle, hogs and sheep. The cattle and sheep are bred on range pastures in the western half of the United States. From these breeding grounds the young stock is moved eastward to finish their growth and fattening in the corn belt of the Upper Mississippi Valley. Some lambs are fattened on irrigated lands adjacent to the western ranges where the by-products of beet-sugar factories are utilised together with alfalfa hay. A part of the young cattle are kept on the ranges during the growth period, while others are moved into the western edge of the corn belt. The final fattening in both cases takes place on corn-belt farms so that the great bulk of the corn (maize) crop is converted into meat on the farms where it is produced. The production of pork is more localised. Some pork is produced on western irrigated lands, where the growing pigs are pastured on alfalfa to be fattened locally or to be shipped eastward to be fattened with cattle on corn. For the most part, however, hogs are bred in the corn belt to be fattened locally, utilising the wastes from cattle feeding.

The meat-producing potentialities of the cotton belt are very great, including, in addition to pasture and corn lands, the by-products from the manufacture of oil from cotton seed. In the past, the full use of these resources has been hindered by the prevalence of a serious cattle disease known as Texas fever. Definite progress has been made in controlling this disease and thus in extending the areas available for efficient meat production. The sheep of the United States, of which the number ranges from 40,000,000 to 50,000,000, yield wool as well as meat. The annual wool crop ranges around 150,000 tons which is slightly less than half the total consumption of the country.

**Dairy Products.**—Dairy products are obtained from about 25,000,000 cows in the United States. The number has increased from about 20,000,000 in 1910. Of the milk produced by these cows, about half is directly consumed. About 35% is used for making butter and about 4% goes into each of the three other important products, viz.: cheese, condensed milk and ice cream. While the dairy industry is carried on in every section of the country, it is most highly developed in the north-central states. Only eight of the 48 states have more than a million dairy cows. The significant developments of the dairy industry in recent years have been the improvement by breeding and selection for higher production, the control of bovine tuberculosis and the centrali-

sation of the manufacture of dairy products. The country is practically self-sustaining with respect to these products.

**Fruits and Vegetables.**—The production of fruits and vegetables constitutes in the aggregate a most important feature of agriculture in the United States; but it comprises a group of such diverse commodities, handled and measured in so many different ways, that it is difficult to present the salient facts in a concise statement. There has been in recent years a very pronounced increase in the volume of interstate movement of fresh fruits and vegetables. It is evident that the consumption *per capita* of fruits and vegetables is steadily increasing, and also there is a tendency to expand production in areas where climatic and soil conditions are favourable and to co-operate in the organisation and development of agencies for the effective distribution and marketing of the products. This has resulted in better quality and longer marketing seasons for many of these commodities.

**Forest Products.**—In the United States, excluding Alaska, about 470,000,000 ac. of land are classed as forest, of which slightly less than 140,000,000 ac. are included in National forests. From this area, the timber crop is being harvested faster than it is being produced. The production of lumber in 1922 was only about two-thirds of what it was in 1910, 44,000 million ft. in 1910 and 31,000 million ft. in 1922, but rose to 37,000 million ft. in 1923. Another important forest product is pulpwood for paper of which the United States consumes annually nearly 6,000,000 cords, and of which two-thirds comes from domestic forests. While the production of lumber has decreased during the past 15 years, the production as well as the consumption of pulpwood has increased, the production by nearly 50% and the consumption by nearly 100%. The other important forest products include turpentine and resin. The annual output from 1910 to 1925 has been about 30,000,000 gal. of turpentine and 2,000,000 bbl. of resin.

**Cotton.**—The production of cotton (*g.v.*) is confined to the Southern states where the crop occupies ordinarily 35,000,000 ac. of land. During 1924 and 1925 the acreage has been substantially higher, reaching 46 million in 1925. The crop of the United States constitutes approximately half of the total world production, and the value of that part of the crop (about one half) exported from the United States has, until recently, equalled or exceeded the combined value of all other agricultural exports. Both in yield and price the fluctuations of this crop have been greater than those of any other important crop. The cotton plant is subject to injury from a number of diseases and insect pests. Probably the most serious of these is an insect known as the Mexican cotton boll weevil (*q.v.*). This pest invaded the United States from Mexico in 1892 and is now established over most of the cotton belt except for a narrow fringe on the north and broader areas to the west where its distribution is limited by climatic conditions. Since 1910 the production of cotton has been extended over a large part of northwest Texas and into irrigated sections of New Mexico, Arizona and California. The aggregate area of irrigated cotton is less than 5,000,000 ac., but conditions favour larger yields in the main belt.

There has been a continuing increase in the manufacture of cotton, most marked in the southeastern states. Formerly cotton manufacture was confined to the states of the northeast, and while the industry has continued to expand in that section, its growth in the south has been much more rapid. The increase in cotton manufacture in the United States has been more rapid than the increase in cotton production, with the result that a smaller proportion of the crop has been available for export. Another important development in relation to the cotton industry has been the better utilisation of the cotton seed. The crop yields two pounds of seed for each pound of fibre. This seed, when crushed, yields 40 gal. or more of oil per ton. The residue of meal and hulls is used as feed for livestock while the oil, after refining, yields edible fats that are widely used as human food.

**Tobacco.**—Tobacco is an important crop in several well-defined districts of the United States, in each of which a special type is produced. The aggregate acreage has varied in recent years from 1,000,000 to 2,000,000 ac. with a tendency toward an increase.

The crop is estimated as having a farm value of from \$100,000,000 to \$500,000,000.

**Sugar.**—Sugar is produced in the United States from sugar beets and cane. Cane production is confined to Louisiana where 200,000 to 300,000 ac. are devoted to the crop, yielding from 100,000 to 350,000 tons of sugar annually. The yield of sugar fluctuates from year to year, but there has been no significant trend of change in recent years. Sugar beets are grown extensively on irrigated lands in the western states and there are about 200,000 ac. in the states of Michigan, Wisconsin and Ohio devoted to the crop. In the western states, the aggregate area is approximately 500,000 acres. The acreage and production of sugar beets has doubled since 1910, the annual yield of sugar from this source is now about 1,000,000 tons. The total consumption of sugar in the United States has increased from 3,500,000 tons in 1910 to nearly 6,000,000 tons in 1925. The annual consumption *per capita* has increased from 80 lb. to more than 100 pounds.

**Exports.**—Of certain classes of commodities the United States produces more than it consumes. Although domestic requirements greatly exceed exports, domestic price levels are determined very largely by the prices obtainable for the exportable surpluses. The volume of the exports of the more important groups of agricultural commodities for the past 15 years is shown in Table I.

TABLE I. *Exports of Important Agricultural Commodities from the United States, 1910-25.*

| Year            | Cereals    | Dairy Products | Meat and Products | Cotton    |
|-----------------|------------|----------------|-------------------|-----------|
|                 | Tons       | Tons           | Tons              | Tons      |
| Average, 1910-4 | 4,624,300  | 12,500         | 628,500           | 2,210,000 |
| 1915 . . .      | 14,147,000 | 51,000         | 807,000           | 2,201,000 |
| 1916 . . .      | 11,155,000 | 109,000        | 1,004,500         | 1,542,000 |
| 1917 . . .      | 10,375,000 | 176,000        | 1,003,500         | 1,544,000 |
| 1918 . . .      | 8,618,000  | 295,500        | 1,173,500         | 1,160,000 |
| 1919 . . .      | 12,566,000 | 390,500        | 1,729,000         | 1,381,500 |
| 1920 . . .      | 16,130,000 | 378,500        | 1,112,500         | 1,771,750 |
| 1921 . . .      | 15,220,000 | 142,500        | 907,500           | 1,405,750 |
| 1922 . . .      | 15,460,000 | 152,000        | 900,000           | 1,679,500 |
| 1923 . . .      | 11,795,000 | 89,000         | 1,010,500         | 1,313,250 |
| 1924 . . .      | 6,445,000  | 113,000        | 1,078,000         | 1,474,750 |
| 1925 . . .      | 10,290,000 | 98,500         | 819,000           | 2,109,750 |

This table shows that for the War period and since, the exports of foodstuffs greatly exceeded the average for the pre-War period. The exports of cotton have been lower during and since the War, but this is due in part at least to the smaller crops of the post-War period.

**Production Efficiency.**—This general review of the more important agricultural industries of the country appears to warrant the conclusion that farmers are steadily increasing the efficiency of production. During the past 15 years the population of the country has increased by nearly 20%. The indications are that domestic consumption of agricultural products *per capita* has also increased. The number of farms has remained constant, and while the acreage devoted to crop production has increased somewhat, the number of workers engaged in farming has not changed significantly. Hence it is apparent that the volume of production for each worker has increased. There are several factors that may have contributed to this result. Two of the more important appear to be agricultural education and the internal-combustion engine. Systematic education in agriculture began to be generally available toward the end of the last century. It has been rapidly improved and extended during the past 25 years.

In addition to the services of agricultural schools and colleges, farmers have had the service of a nation-wide system of advice and assistance in dealing with their production problems. This agricultural extension service was begun in a small way as early as 1904 to meet the exigency created in the cotton belt by the invasion of the cotton boll weevil. It was extended later into other sections and in 1913 was definitely established over the whole country. There can be no doubt that education

and the application of science to agriculture has contributed greatly to the efficiency of production. The internal-combustion engine has come into very general use by farmers during the past 15 years. A great variety of stationary types have been utilised in doing the work of the farm. Automotive types have found a place in certain classes of field-work, and the automobile has come to be very extensively used both as a passenger vehicle and as a truck. The saving of time and the lightening of labour resulting from this new form of power is not easily measurable, but it is obvious that it has been a factor of great importance in changing the conditions of farming and of country life.

**Economic Conditions.**—During the past 15 years the business of farming in the United States has experienced a period of great prosperity, followed by a period of depression. During the period of agricultural expansion culminating in 1910, new lands were cheap, and farms increased in value as time went on, even if the profits from production were low. From 1910 to 1920 land prices advanced even more rapidly than formerly, so that new enterprises called for capital investments much higher than had previously been known. During the same period the conditions of credit for agriculture were greatly improved, so that the post-War period of readjustment beginning in 1920 found agriculture carrying an unprecedented burden of indebtedness for which it has been difficult to find interest payments and still more difficult to liquidate. A substantial improvement of credit conditions for agriculture was achieved in 1916 as a result of the Federal Farm Loan Act (*see* FEDERAL FARM LOAN ACT). Other credit facilities have been added, one of which is known as intermediate credit to provide capital for such agricultural operations as live-stock production that may require two or three years to complete.

Another system of credit has been based on warehouse receipts issued for standardised agricultural products such as grain and cotton. Such receipts are extensively used as collateral for short-time loans, which makes it possible for farmers either individually or co-operatively to meet seasonal production expenses without selling the product at harvest time if market conditions are not favourable. Agricultural co-operation has also made definite progress during the past 15 years. This has had on the one hand the advantage of more efficient and orderly marketing to the direct financial benefit of the co-operators, and on the other hand co-operators have learned something of market requirements, of the value of improved methods of production, and of the use of market grades and standards. In many instances these educational benefits have outweighed the direct financial benefits.

**Science in Agriculture.**—The problems of agriculture have been the subject of much scientific inquiry for a generation or more. Such inquiry has been liberally supported by the Federal Govt. and by the states, and effective work has been done by various independent agencies. The results have been usefully applied in very many different fields. Some of the more outstanding achievements have been made in connection with the control of serious plant and animal diseases. Methods of spraying orchard fruits and vines have been widely and effectively used to control or prevent injury from both insects and fungous parasites. A vaccine for hog cholera has been developed. Steady progress is being made in restricting bovine tuberculosis and Texas fever. These and many other diseases and pests have laid a heavy tax on farming that has been lightened by applying the results of scientific work.

The problems of soil fertility—among the first undertaken by agricultural scientists—engage attention. One of the forward steps in this field has been the recognition that acid soils are not unproductive with all crops, but are indeed necessary for the successful production of certain crops. Coincident with this, the character and causes of soil acidity and of soil alkalinity have become known. In the field of plant breeding great progress has been made, not only in the understanding and application of the laws of heredity but also in the introduction of breeding varieties suited to special conditions of soil or climate, and breeding for resistance to plant diseases. The utilisation by farmers of these results of scientific inquiry has been an important factor in increasing the efficiency of production. While it cannot be said

that farmers in the United States have been able as yet to produce yields per acre as high as the yields obtained in Europe, it can be claimed that the production per man engaged in farming is very much higher. The yield per acre appears to be steadily though slowly rising. The increase in efficiency per man has been more rapid, especially in recent years. This increase has been gained with steadily lessening manual labour, with more time for social enjoyments and with a continuing improvement of living conditions on the farms.

**BIBLIOGRAPHY.**—See *Fourteenth Census of the United States, 1920*, vol. V, VI, *Agriculture*. The Federal Dept. of Agriculture issues many statistical bulletins relating to crops, supplies and stocks of staple commodities. The most important of these are summarised in the *Year Book of the Department of Agriculture*. The *Statistical Abstract of the United States*, published annually, contains much data on agriculture, consumption estimates and prices. The *Financial Review*, published annually by the *Commercial and Financial Chronicle*, New York, contains useful information on crops. The Bureau of the Census also issued preliminary figures of the U.S. Census of Agriculture, 1925. Final figures had in July 1926 appeared only for Connecticut, Delaware, Maine, Massachusetts, New Hampshire, Rhode Island, Vermont and the District of Columbia. These contain interesting comparisons with former years. (C. S. S. \*)

#### IV. POPULATION AND IMMIGRATION

**Total Population.**—In 1920 (Jan. 1) the population of the United States (excluding all outlying possessions) was 105,710,620, as compared with 91,972,266 in 1910 (April 15). The rate of increase between these two dates, 14.9%, was considerably less than in the preceding decades. Never before in a 10-year period had the rate of increase fallen below 20%. The decline was due to the large falling off of immigration in the last half of the decade, and in some slight degree to the epidemic of influenza in 1918, as well as to the casualties resulting from the World War. The population of the outlying possessions was 12,112,545, of which the Philippine Is. furnished more than 10,000,000. The total population of the United States with its outlying possessions in 1920, therefore, numbered 117,823,165. Excluding the outlying possessions, the total addition to the population in the decade 1910-20 was 13,738,354 as compared with nearly 16,000,000 in the previous decade. The estimated population of the continental United States in 1925 (July 1) was 113,493,720.

**Territorial Divisions and Component States.**—The accompanying Table I. shows the population by territorial divisions and component states, with changes between 1910 and 1920, with a final column of estimated population in 1925. (Figures for Florida, Massachusetts, Rhode Island and South Dakota, however, are based upon state censuses taken in 1925.)

There was no change between 1910 and 1920 in the relative rank of the territorial divisions, and only minor shiftings for most of the states, California rising from 12th to 8th place. More than one-half the increase in population was found in the north, and the rate of gain in this section was greater than in the south, but less than in the west.

**Sex.**—By sex the population in 1920 was divided as follows: males, 53,900,376; females, 51,810,244—104 males to 100 females. The excess of males is attributable in part to immigration, for in the foreign-born population the males greatly outnumber the females. In a few states the females are in excess of males *i.e.*, in Massachusetts 96.3 males to 100 females; in Rhode Island, 97. This is probably due to the inflow of female operatives to the textile factories. In some of the far-western states the proportion of males to females runs very high, as in Nevada, 148.4; Wyoming, 131.3; Arizona, 121.9. The mining industry accounts for these differences. The two sexes in these sections, however, are nearer in numbers than in 1910, when the ratio of males for the Mountain states was 128 to 100 females, while in 1920 it fell to 115.7. In the Pacific states the ratio dropped from 130 to 114, showing that these sections are rapidly approaching the standard forms of family life which obtain in the older portions of the country.

**Negroes, Indians and Orientals.**—The negro population in 1920 was nearly 10% of the total population, *i.e.*, 10,463,131 in a total of 105,710,620. For full details see NEGRO.

TABLE I. *Increase of Population*

|                      | 1920       | 1910       | Increase  | Increase % | 1925 Estimated |
|----------------------|------------|------------|-----------|------------|----------------|

The number of Indians declined from 265,683 in 1910 to 244,437 in 1920. This apparent decrease, however, is probably due to the fact that in 1910 persons with only slight traces of Indian blood were enumerated as Indians, and in 1920 were classified as whites. The Chinese also decreased in number, as might be expected from the policy of exclusion; in 1910 there were 71,531, and in 1920, 61,639. The number of Japanese, however, increased from 72,157 to 111,010, or 53.0%. About 30,000 of this increase is credited to California, and a little over 4,000 to the State of Washington.

*Foreign-born.*—The foreign-born white population, owing to the check in immigration resulting from the World War, increased but slightly, from 13,345,545 to 13,712,754, or 2.7% between 1910 and 1920, as against an increase of 30.7% between 1900 and 1910. The numerical increase in this group of the population, 367,209, was much smaller than in any preceding decade since 1850. This element increased between 1910 and 1920 in 20 states and the District of Columbia, and decreased in 28 states; in the previous decade there was a gain in every state except five. Arizona and Texas showed the largest rate of increase, 67% and 50% respectively, due to Mexican immigration. Table II. shows the foreign-born whites for the four states having over 1,000,000 of this element in 1920. In 1910 the foreign-born whites constituted 14.5% of the total population of the United States and in 1920, 13%. The nativity of the white population in 1920 is shown in Table III. Little over

TABLE II. *Foreign-born Whites*

| State         | 1920      | 1910      | 1900      | Per cent increase 1910-20 | Per cent increase 1900-10 |
|---------------|-----------|-----------|-----------|---------------------------|---------------------------|
| Illinois      | 1,206,951 | 1,202,560 | 964,635   | 0.2                       | 24.7                      |
| Massachusetts | 1,077,534 | 1,051,050 | 840,114   | 2.5                       | 25.1                      |
| New York      | 2,786,112 | 2,729,272 | 1,889,523 | 2.0                       | 44.4                      |
| Pennsylvania  | 1,387,534 | 1,438,719 | 982,543   | -3.6                      | 46.4                      |

one-half of the total white population 55.3%, was native born with native-born parents. In New England only 30.8% were in this group; and in Massachusetts less than one-third, 31.9. According to the post-War map, the countries from which had come the largest numbers of foreign-born who were in the United States in 1920, were Germany, 1,686,108; Italy, 1,610,113; Russia, 1,410,495; Poland, 1,139,979; Canada, 1,124,925; Ireland, 1,037,234; England, 813,853; Sweden, 625,585; Austria, 575,627.

TABLE III. *Nativity of Whites, 1920*

|                       | Number      | Per Cent |
|-----------------------|-------------|----------|
| Native parentage      | 58,421,957  | 55.3     |
| Foreign parentage     | 15,694,539  | 14.8     |
| Mixed parentage       | 6,991,665   | 6.6      |
| Total native born     | 81,108,161  | 76.7     |
| Foreign-born white    | 13,712,754  | 13.0     |
| Total white           | 94,820,915  | 89.7     |
| Negro                 | 10,463,131  | 9.9      |
| Other non-white races | 426,574     | 0.4      |
| Total population      | 105,710,620 | 100.0    |

The following figures show the total number of foreign-born whites in certain states, with the foreign country which had furnished the largest number in that state: California, 757,625 (Italy, 88,504); Illinois, 1,206,951 (Germany, 205,491); Massachusetts, 1,077,534 (Ireland, 183,171); Michigan, 726,635 (Canada, 164,502); Minnesota, 486,164 (Sweden, 112,117); New Jersey, 738,613 (Italy, 157,285); New York, 2,786,112 (Italy, 545,173); Ohio, 678,697 (Germany, 111,893); Pennsylvania, 1,387,850 (Italy, 222,764); Texas, 360,519 (Mexico, 249,652); Wisconsin, 460,128 (Germany, 151,250).

In connection with the problems of Americanisation the statistics of citizenship of the foreign born are of interest. In 1920, 12,686,393, or 89.4% of this element, were 21 years of age and over; 7,063,594 were men and 5,622,799 were women. Table

IV. shows the number in 1920 naturalised, those who had taken out first papers, aliens, and those for whom no reports were obtained.

TABLE IV. *Naturalisations, 1920*

|              | Men       |          | Women     |          |
|--------------|-----------|----------|-----------|----------|
|              | Number    | Per Cent | Number    | Per Cent |
| Naturalised  | 3,322,104 | 47.8     | 2,899,601 | 52.0     |
| First papers | 1,120,833 | 16.1     | 77,755    | 1.4      |
| Alien        | 2,253,691 | 30.9     | 2,226,672 | 40.0     |
| No reports   | 366,966   | 5.2      | 376,775   | 6.6      |

In 1910, 45.6% of the men were naturalised, as compared with 47.8% in 1920, and only 8.6% had taken out first papers, as compared with 16.1% in 1920.

Increasing facilities in ocean transportation, and the higher wages received by immigrants, enabling them to travel, led to a constant stream of repatriation in the years following the War. In order to determine the net increase of population by immigration, it is necessary, therefore, to determine both arrivals and departures. Table V. compiled by the Bureau of Immigration, shows the changes for the 14 years 1910-24.

TABLE V. *Immigrants, in Thousands*

|      | Admitted  |               |       | Departed |              |       | Added to population |
|------|-----------|---------------|-------|----------|--------------|-------|---------------------|
|      | Immigrant | Non-immigrant | Total | Emigrant | Non-emigrant | Total |                     |
| 1910 | 1,042     | 156           | 1,198 | 202      | 178          | 380   | 818                 |
| 1911 | 878       | 152           | 1,030 | 296      | 222          | 518   | 512                 |

| 1924 | 707       | 172           | 879   | 77       | 140          | 217   | 663                 |

Since 1915 there has been a marked decline in immigration, due to the World War. In the five years 1910-4, the total number of immigrants was 5,174,000, and in the succeeding five years ending in 1919, only 1,173,000. In 1921 immigration increased to pre-War figures; declined in 1922 owing to industrial depression; but by 1923 again was tending upward.

Immigrants may be classified (a) as to race or people and (b) as to country of last residence. Table VI. shows immigration,

TABLE VI. *Immigrant Aliens, by Race*

by race, for the most important groups for the years 1910 and 1924. Table VII. shows immigration of countries for the years 1910 and 1923.

TABLE VII. *Immigrant Aliens, by Country*

| Country of last residence | 1924    |                   | 1910    |                   |
|---------------------------|---------|-------------------|---------|-------------------|
|                           | Number  | Per cent of total | Number  | Per cent of total |
| Austria                   | 7,505   | 1.5               | 135,793 | 13                |
| Hungary                   | 5,806   | .8                | 122,944 | 12                |
| Germany                   | 75,091  | 20.6              | 31,283  | 3                 |
| Greece                    | 4,871   | .6                | 25,888  | 2                 |
| Italy                     | 56,246  | 8.0               | 215,537 | 21                |
| Russia                    | 12,649  | 1.8               | 186,792 | 18                |
| England                   | 24,466  | 3.5               | 46,706  | 5                 |
| Ireland                   | 17,111  | 2.4               | 29,855  | 3                 |
| Norway                    | 11,986  | 1.7               | 17,538  | 2                 |
| Portugal                  | 2,769   | .4                | 8,229   | 1                 |
| Sweden                    | 18,310  | 2.6               | 23,745  | 2                 |
| Turkey in Europe          | 1,481   | .2                | 18,405  | 2                 |
| Turkey in Asia            | 2,820   | .4                | 15,212  | 1                 |
| British North America     | 200,690 | 28.4              | 56,555  | 5                 |
| Mexico                    | 89,336  | 12.6              | 18,691  | 2                 |

It will be observed that by 1924 there was a change in the racial composition of immigration as compared with 1910. Immigration from Italy and eastern European stocks fell off; from Austria, Hungary, Germany and Russia it practically stopped during the War, but beginning with 1921, the flow from Germany assumed greater proportion. Immigration from the northern border, of both English and French Canadians, and from Mexico greatly increased. Until the World War, Europe was the chief source of immigration to the United States, furnishing 90% of the total. The percentage coming from Europe fell, however, to 60% in 1915, 50% in 1916, 45% in 1917, 28% in 1918 and 17% in 1919. In 1920 it rose to 57% and in 1924 to 51%. The proportion of females among the immigrant aliens in 1924 was 44%, as compared with 33% in the years 1910-4. Such increase presumably makes for the stability of the immigrant population.

In 1917 a literacy test was imposed upon immigrants, exemptions being made in certain cases. As a result only 15,094 illiterate immigrants 16 years of age and over, or 4.4%, were admitted in 1920. During the years 1908-17, 1,617,000 illiterate immigrants 14 years of age and over were admitted. Undoubtedly the new restriction should show in the course of the decade 1920-30 a marked effect upon the degree of illiteracy in the United States. By the Immigration Act passed in 1921 and subsequent legislation, the number of immigrants admitted from any one country in the year July 1, 1921, to June 30 1922, was restricted to definite quotas of the persons of that nationality resident in the United States at an earlier period. Only 35,800 immigrants, were eligible for admittance during 1921-2. The United Kingdom was limited to 77,200; Germany to 68,000; Italy to 42,000; Russia to 34,200 and Poland to 25,800.

*Urban and Rural Population.*—The tendency of the population to concentrate in towns and cities continued unabated. In 1910 the percentage of the population living in urban territory (that is, in cities and other incorporated places of 2,500 inhabitants or more, and in towns of that size in Massachusetts, New Hampshire and Rhode Island) was 46.3%, and in 1920 it was 51.4.

Table VIII. shows the population of cities having 50,000 inhabitants or more in 1920 with comparison for 1910. In the final column estimates of population in 1925 of most of the cities, as made by the Bureau of the Census, are given.

The cities with increases of over 100% were Detroit, Mich., due to the development of the automobile industry; Akron, O., the home of several large rubber factories which manufacture tires for automobiles; Flint, Mich., also an automobile city; Tulsa, Okla., a centre of oil activity; Gary, Ind., a city recently built up by the U.S. Steel Corp.; Bethlehem, Pa., also a steel city; Knoxville, Tenn.; and Long Beach, California. With the exception of Bethlehem, no one of these cities is in the east.

TABLE VIII. *Cities with 50,000 Inhabitants or More*

| Rank in 1920 |                      | 1920      | 1910      | Percentage increase | 1925 estimate |

| 143          | Huntington, W. Va.   | 50,177 | 31,161 | 61.0                | 63,485        |
| 144          | Topeka, Kan.         | 50,022 | 43,684 | 14.5                | 55,411        |

Nearly one-fourth of the gain in the total population was due to the growth of the 12 largest cities, which in 1920 all had more than 500,000 inhabitants each. In 1910 there were only eight cities with a population of 500,000 or over, and in that year 12.5% or one-eighth of the total population lived in cities of this size; in 1920 the proportion was 15.5%. In 1910 there were 42 cities with a population between 100,000 and 500,000; in 1920 there were 56. (See URBANISATION.)

*Occupations.*—The proportion of the population engaged in gainful occupations was recorded as slightly less in 1920 than in 1910, declining from 41.5% to 39.4%. This decline was attributed to the forwarding of the census date from April 15 1910, to Jan. 1 1920, when a considerable number usually engaged in agricultural and building industries were idle. Table IX. classifies those engaged in industry according to the principal division of occupations.

TABLE IX. Industrial Occupations

| Occupation                                 | Number     |            | Per Cent |       |
|--------------------------------------------|------------|------------|----------|-------|
|                                            | 1920       | 1910       | 1920     | 1910  |
| <b>Males:—</b>                             |            |            |          |       |
| Agriculture, forestry and animal husbandry | 9,869,030  | 10,851,581 | 29.8     | 36.1  |
| Extraction of minerals                     | 1,087,359  | 964,075    | 3.3      | 3.2   |
| Manufacturing and mechanical industries    | 10,888,183 | 8,808,161  | 32.9     | 29.3  |
| Transportation                             | 2,850,528  | 2,530,795  | 8.6      | 8.4   |
| Trade                                      | 3,575,187  | 3,146,582  | 10.8     | 10.4  |
| Public service (not elsewhere classified)  | 748,666    | 445,733    | 2.3      | 1.5   |
| Professional service                       | 1,127,391  | 959,470    | 3.4      | 3.2   |
| Domestic and personal service              | 1,217,968  | 1,241,338  | 3.7      | 4.1   |
| Clerical occupations                       | 1,700,425  | 1,143,829  | 5.2      | 3.8   |
| All occupations (male)                     | 33,064,737 | 30,091,564 | 100.0    | 100.0 |
| <b>Females:—</b>                           |            |            |          |       |
| Agriculture, forestry and animal husbandry | 1,084,128  | 1,807,501  | 12.7     | 22.4  |
| Extraction of minerals                     | 2,864      | 1,094      | ..       | ..    |
| Manufacturing and mechanical industries    | 1,930,341  | 1,820,570  | 22.6     | 22.6  |
| Transportation                             | 213,054    | 106,625    | 2.5      | 1.3   |
| Trade                                      | 667,792    | 468,088    | 7.8      | 5.8   |
| Public service (not elsewhere classified)  | 21,794     | 13,558     | 0.2      | 0.2   |
| Professional service                       | 1,016,498  | 733,891    | 11.9     | 9.1   |
| Domestic and personal service              | 2,186,924  | 2,531,221  | 25.6     | 31.3  |
| Clerical occupations                       | 1,426,116  | 593,224    | 16.7     | 7.3   |
| All occupations (female)                   | 8,549,511  | 8,075,772  | 100.0    | 100.0 |

Table IX. does not include all those engaged in economic services. Many children and wives work for their parents or husbands, and as technically they do not receive wages they are not recorded as engaged in gainful occupations, although in reality they contribute to the household economy. If these be included, approximately two-thirds of the population was engaged in some degree in creating wealth or in services which might be valued in economic terms. Nearly one-third of all the workers were engaged in agricultural and allied industries.

*Education.*—In 1922 there were 23,239,227 children enrolled in the public schools, constituting over 75% of the population from five to 18 years of age. There were 722,976 teachers in the public schools, or one to every 32 pupils. Of the teachers 16% were males. The total expenditure for education in elementary and secondary schools was \$1,580,671,296, or about \$68 per pupil. The above enrolment of pupils includes 2,229,000 attending public high schools. In addition there were 186,641 pupils in private high schools and academies. There were 350 public and private normal schools with an enrolment of 217,000. Universities, colleges and professional schools numbered 780 in 1922, having 67,649 students of preparatory grade, 415,806 of collegiate grade, 23,016 graduate students and 75,466 students in professional schools. Professional schools numbered 418, as follows: theology, 116, with 8,566 students; law, 110,

with 27,017 students; medicine, 74, with 16,747 students; dentistry, 43, with 11,773 students; pharmacy, 59, with 8,202 students; and veterinary medicine, 16, with 716 students. (*See EDUCATION, United States.*)

The statistics of illiteracy for 1920 showed a diminution compared with those for 1910. The Census Bureau classifies as illiterate any person 10 years of age or over who is unable to write in any language, regardless of ability to read. Illiterates in 1920 numbered 4,931,905, or 6% of the population at least 10 years of age, as compared with 7.7% in 1910. The proportion of illiteracy for the individual states in 1920 ranged from 1.1% in Iowa to 21.9% for Louisiana. Illiteracy is very marked in those states in which the coloured population or the foreign-born population is relatively large. There has been a marked decrease in illiteracy of negroes, declining from 44.5% in 1900 to 30.4% in 1910 and 22.9% in 1920. Of the native whites of native parentage only 2.5% in 1920 were illiterate.

*Births and Deaths.*—In 1915 the Census Bureau began the annual analysis and publication of birth statistics based upon data obtained from state registration records. In 1923 the birth registration area covered nearly three-fourths (72.2%) of the total population. Between 1915 and 1924 the birth-rate declined from 25.1 to 22.5 per 1,000. The ratio of male to female births since 1915 was practically constant; in 1915 it was 1,055 males to 1,000 females, and in 1921 1,057 to 1,000. The fecundity of foreign-born mothers was much greater than that of native mothers. For example, in Connecticut, in 1919, although the white married women of foreign birth, age 15 to 42, constituted only 46% of the total population of white married women of that age group, they gave birth to 57% of the children. In Massachusetts 49% of foreign-born mothers gave birth to 53% of the children; and in New York 43% of foreign-born mothers gave birth to 49% of the children. The first and second children formed 50% of all children born to native white mothers, while only 34% born to foreign-born mothers were first and second children.

The registration area for mortality statistics covers 90% of the population. Between 1900 and 1922 the death-rate varied from a minimum of 11.6 per 1,000 in 1921 to 18.1 per 1,000 in 1918. This latter high rate was due largely to a great influenza pandemic. The rate of infant mortality (the number of deaths of infants under one year of age per 1,000 born alive) for the registration area in 1923 was 81 for the white population; for the negro population 143; and for the total population, 86.

A fifth nation-wide compilation of statistics of marriage and divorce was made by the Bureau of Census, covering the year 1923. There were 1,224,373 marriages, or 11.1 per 1,000 of the population. In the northern states, the rate was lower, while in southern groups in some instances it exceeded 13. There were 165,226 divorces. The statistics were not analysed to show ratios of divorce to marriage, but only the ratios to population. For the whole country the ratio of divorces was 149 per 100,000 population. In New England the ratio was 104, Middle Atlantic States, 59, West South Central States (Arkansas, Louisiana, Texas and Oklahoma), 250, and Pacific States, 260. Of the divorces 32% were granted to the husband and 68% to the wife.

*BIBLIOGRAPHY.*—Relating to the *Fourteenth Census of the United States, 1920*, are the following volumes: I. *Population, Number and Distribution of Inhabitants*; II. *Population, General Report and Analytical Tables*; III. *Population, Composition and Characteristics by States*; IV. *Population, Occupations*. The data for the census of 1910 are graphically represented in the *Statistical Atlas of the United States 1914*. Important volumes on special topics have been recently published by the Bureau of the Census: *Negro Population 1900-1915* (1918); *Indian Population in the United States and Alaska, 1910* (1915); *Religious Bodies, 1916*; Part I., *Summary and General Tables* (1919); Part II., *Separate Denominations* (1919); *Insane and Feeble-minded in Institutions 1910* (1914); *Benevolent Institutions, 1910* (1913); *Deaf Mutes in the United States, 1910* (1918); *Paupers in Almshouses, 1910* (1915); *Prisoners and Juvenile Delinquents, 1910* (1918); *Statistical Directory of State Institutions for Defective, Dependent and Delinquent Classes* (1919); *Increase of Population in the United States 1910-1920* (1922). The Bureau of the Census continues the annual compilation on Mortality Statistics, begun in 1900. As the registration area is constantly enlarged, these latter statistics

are of increasing value. The most serviceable single source-book is the annual volume, *Statistical Abstract of the United States*, first issued in 1878, published by the Dept. of Commerce. This assembles data on area and population, including census returns, immigration and vital statistics. Most of the statistics are derived from official publications, but when they are wanting, reliance is placed upon private statistical agencies. (D. R. D.)

## V. COMMUNICATIONS

*Railways.*—The development of United States railways from 1910 to 1924, in mileage, equipment, employees, public service and finance, may be summarised in a comparison of the significant statistical units. In miles of railway the total in 1910 was 240,831. In 1924 the total was 258,238. Practically all of the increase was in 1911 to 1914. In 1914 the total was 256,547. The additions since 1914 have been offset in substantial part by the miles of branch lines abandoned. In total track miles the increase was greater in degree—351,767 in 1910 and 415,027 in 1924. The ratio of total tracks to road miles was 1.46 in 1910 and 1.61 in 1924.

The number of locomotives was 60,019 in 1910 and 69,486 in 1924. The increase in number, however, does not fully indicate the increase in capacity. The average tractive power was 27,282 lb. in 1910 and 39,891 lb. in 1924. Passenger train cars increased in number from 47,179 to 57,451. The number of freight cars grew from 2,148,478 to 2,411,627, with an average capacity of 35.9 tons in 1910 and 44.3 tons in 1924.

The net capitalisation in 1910 was about 14.4 thousand million dollars, of which 44% was in capital stock and 54% in funded debt. In 1924 the net capitalisation was 18.2 thousand million, of which 40% was in capital stock and 60% in funded debt. As it was impracticable from 1914 to 1923 to finance through the sale of stock, nearly all of the increases in railway capitalisation were in funded debt. The net capitalisation per mile of road was \$62,657 in 1910 and \$75,332 in 1924. The total dividend payments actually decreased. In 1910 they were \$405,771,416. In 1924, with an increase of 16% in total stock, they were \$382,879,890. The average dividend rate on all stock in 1910 was 5%; in 1924 it was 4.12%.

The financial results of operation were as follows: operating revenues increased from 2,812 million dollars to 6,045 millions. Operating expenses advanced from 1,882 millions to 4,609 millions. Taxes grew from 98 millions to 347 millions, and the net railway operating income (the amount left to pay interest and other fixed charges and dividends) was 805 millions in 1910 and 984 millions in 1924. In other words, the increase of 115% in revenues was accompanied by increases of 145% in expenses and 254% in taxes, leaving an increase of but 12% in net income as the return on the 26% increase in total invested capital. These figures indicate that the net earning power of railways suffered substantial impairment during the 14-year period.

The transportation product may be measured in passengers and tons carried one mile. The passenger miles of 1910 were 32.3 millions; in 1924 they were 36.4 millions. Beginning with 1923 railway passenger traffic, notably in short-distance riders, has shown a tendency to decrease, principally because of motor-bus competition and the greater use of the automobile by individuals. The revenue ton-miles of 1910 were 255 thousand millions; in 1924 they were 392 thousand millions. The effect of motor-truck competition for short hauls, while substantial in absolute figures, was not serious relatively, as such losses were small in comparison with the gains in other freight traffic. Expressed in averages which take account of increased road miles the passenger miles per mile of railway were 138,169 in 1910 and 153,618 in 1924. Ton-miles per mile of railway were 1,071,086 in 1910 and 1,518,556 in 1924.

The substantial increases in rates in 1918 and 1920 are reflected in the revenue averages. The average revenue per passenger mile in 1910 was 1.938 cents; in 1924 it was 2.985 cents. The average revenue per ton mile in 1910 was .753 cents; in 1924 it was 1.132 cents. That these increases were not equal in degree to the higher operating costs is shown by the decline in net earnings.

The number of employees in 1910 was 1,669,420 and their compensation was \$1,143,725,306, an average of \$685 per employee. This average may not be entirely accurate as the 1910 method of counting employees was somewhat defective. In 1924 the number of employees was 1,731,362 and their compensation was \$2,825,775,181, an average of \$1,613 per employee. It will be noted that the increases of 13% in passenger miles and 54% in ton-miles were accomplished with but 5% increase in the number of employees but the aggregate compensation shows an increase of 147% and the average per employee was advanced 136%.

A striking indication of the gain in operating efficiency is shown in the relation between train miles and passenger miles and ton-miles. The increase of 13% in passenger miles was accomplished with but 5% increase in passenger train miles and the 54% increase in ton-miles was produced with actually less freight train miles. This performance was the result of an increase in the freight train load from 380 revenue tons in 1910 to 634 revenue tons in 1924. The heavier train load was made possible by locomotives of greater capacity, larger cars, stronger roadway structures and improved technique.

The 1887 Act to Regulate Commerce was intended primarily to correct abuse of power on the part of railway managers. The Interstate Commerce Commission, as a Federal agency acting for Congress, was given wide powers over rates, finance and accounting. While the Commission's early accomplishments were substantial the experience during the first 15 years demonstrated that the law was defective as the Commission was without sufficient power to effect all of the needed reforms.

The 1906 and 1910 amendments to the Act corrected certain outstanding deficiencies by giving the Commission power not only to find that a rate was unreasonable but also to prescribe the reasonable rate, and to suspend a rate proposed by a carrier. Broadly speaking, the Commission since 1910 has had complete control over interstate rates, and the tendency has been for that Federal body to supersede the state commissions in their regulation of intrastate rates. While formerly the burden of proof had been on the Commission to prove that a rate was unreasonable, the burden of proof of reasonableness was shifted to the carriers.

For a series of years prior to 1910 the tendency of rates had been downward. The steady growth in traffic and the improvements in facilities, equipment and operating methods, had enabled the carriers to absorb rising costs, reduce transportation charges and earn sufficient in net income to yield reasonable returns on capitalisation, finance extensions and improvements, and maintain the surplus essential to sound credit. From the beginning of the decade 1910-20, however, the greater costs of materials and the higher wage rates incident to changed economic conditions began adversely to effect net income, and the carriers attempted to prevent further losses by increasing rates. In 1910 the railways collectively appealed to the Commission for authority to advance freight rates, but the Commission in denying the application held that the anticipated increase in traffic and a higher degree of operating efficiency should enable the carriers to earn a fair return. In 1914, 1915 and 1917, with continuing impairment of net earnings, further efforts were made by the carriers to convince the Commission that advances in rates were justified. These efforts met with but partial success, as the authorised increases were small in extent and limited territorially.

Viewed in retrospect it appears that the Commission was unduly optimistic in assuming that the growth in traffic and greater economies in operation would avert the threatened impairment in railway net earning power and credit. The railway financial situation in 1915 was so serious that 42,000 mi. of railway, one-sixth of the total, were in the hands of receivers. Railway extensions practically ceased and additions and betterments to facilities and equipment were confined in the main to the few strong companies.

A substantial increase in traffic in 1916, as a result of War orders from the Allies, and the consequent increase in railway revenues, partially relieved the financial distress. In April 1917,

the United States entered the War, and the demands for railway transportation were further increased. The additional load overtaxed railway facilities and serious congestion resulted in the late fall of that year. While that congestion was due in large measure to conflict in priority rights for movement of war materials, it may be attributed in greater part to the slowing up in railway development during the preceding decade when the carriers were endeavouring to convince the Commission that financial relief in advanced rates was essential to the continuation of adequate transportation service.

From Jan. 1 1918, until March 1 1920, the railways of the United States were operated for the Government by a Director-General of Railroads with almost unlimited powers to administer the railway as one unified system during the crisis. As rental for the railway properties the government agreed to pay yearly to each company a sum equal to its average annual net income during the three years ended June 30 1917, and to return the railways to their owners, within 24 months after the signing of treaties of peace, in physical condition equal to that when taken over by the government or to compensate the owners for undermaintenance.

Under unified operation a tangle of priority orders was overcome and the railways functioned effectively as a branch of the Government. The congestion was relieved early in 1918 and thereafter there was no delay to essential traffic—the movement of troops, military and naval supplies, and essential commodities. Civilian travel was discouraged and the movement of non-essential freight was curtailed. The Director-General was given hearty support both by employees and the general public. The passenger miles, including troop movements, and the ton-miles of 1918, with but minor additions to facilities and equipment, were greater than in any previous year.

Directly after the conclusion of the War an effort was made by those favourably inclined toward the nationalisation of railways to continue the experiment of Federal control indefinitely, but the proposal met with pronounced public disapproval. As an emergency measure for war purposes it was successful, even though costly, but as a permanent policy it had little support. The railways were returned to their owners on March 1 1920.

One of the first major acts of the Director-General was to grant substantial wage increases to employees. Subsequently during the period of Federal control other wage advances were made so that at the end of Federal control the average wages were approximately double those of 1917. Besides these advances important concessions in national standardised agreements were made to the labour organisations, and those organisations emerged from the War period with very much greater strength than before.

The Director-General's second act of major importance was in June 1918, when he arbitrarily advanced freight rates 25% and passenger rates about 20%. The rate increases, however, were not sufficient to overcome the higher wages and other increased operating costs and the government failed to earn the amounts paid as rentals. The deficit of 1918 was augmented in 1919, when there was a sharp recession in business and railway traffic. The total deficit from operation, plus the cost of administration and claims paid for undermaintenance and other causes, was in excess of \$1,600,000,000, or over \$2,000,000 per day. A large part of that deficit, however, could have been avoided if the Director-General had exercised his authority to order a second advance in rates in 1919. Such action would have been justified by higher costs but the Administration chose to incur a larger deficit rather than afford stimulus for further advances in commodity prices.

Inasmuch as the Director-General was concerned only with the results of operation as a whole, and was not interested in the individual units by themselves, competition was eliminated and there was a substantial degree of unification in joint use of facilities and equipment and much short-cutting in accounting and pooling of revenues and expenses. Traffic was routed over the lines which were best fitted to handle it, regardless of former traffic arrangements, and the right of shippers to designate

routing was suspended. All of these things added to the aggregate capacity of the unified system in the emergency and some of the expedients resulted in economies, but the elimination of competition was so distasteful to the public that practically all of the unification innovations were abandoned when private operation was resumed.

The legislation under which pre-War railway control was restored was known as the Transportation Act of 1920. It provided for a transition period of six months in which the government continued its War-time guarantee while the companies were reorganising and the Interstate Commerce Commission was revising rates to take account of higher operating costs.

The Transportation Act contained several important amendments to the Act to Regulate Commerce. Continuing and broadening all of the powers vested in the Commission by the original Act and its several amendments, it contained a new rule of rate-making. All previous laws, designed to protect the public, were essentially corrective and punitive; they provided no protection to the carriers against regulation which might be unduly injurious. The 1920 law, however, contained the mandate that in addition, to the major duties of insuring reasonable rates, preventing undue discrimination in rates or service, and supervising operation, accounting and finance, the Commission should establish the rate scales as a whole, so that the carriers as a whole in large territorial groups, should be able, under honest and efficient operation, to earn "as nearly as may be" a fair return on the value of the properties as a whole in each group. The fair return for two years was set at a maximum of 6%, the Commission subsequently to use its discretion in defining the rate. In 1922 the Commission set it at 5½%. This principle, however, was to apply to the railways as a whole in territorial groups. It did not apply to the carriers individually. Nor was it a guarantee either to the individual carrier or to the railways as a whole. As a matter of fact, even though the rates in Aug. 1920, were advanced from 25% to 40% with the purpose of bringing a 6% return on value, the decline in traffic in 1921 upset calculations and the return was but 2.9% on the carriers' book value, including materials and working cash. In 1922, the return was 3.6%; in 1923, 4.4%; in 1924, 4.3%; and about 4.9% in 1925. From the viewpoint of the carriers the rate-making mandate of the 1920 law has been disappointing. In no year since the law was enacted, up to and including 1925, did the return as a whole equal the 5½% standard.

For the shortage under the fair return the carriers have no recourse, but another section of the law known as the "recapture" clause, requires the individual carriers who earn in excess of 6% on value to turn over one-half of the excess to the government for a revolving fund from which the Government may make loans to the weaker carriers. In 1924 and 1925 substantial sums were thus recaptured from the few prosperous roads which earned in excess of 6% on value, but the very much greater number of companies which earned less than the fair return were without remedy.

The principle of recapture was a temporary expedient to operate until a permanent remedy could be had in the principle of consolidation. The 1920 law recognised the fact that under competitive conditions a scale of rates which would yield a fair return to the group would give more than a fair return to the strong and less than a fair return to the weak carriers in that group. Rates on competitive traffic necessarily are uniform. To enable the Commission to establish such uniform rates so that all of the carriers would earn substantially the same rate of return, the law required the Commission to make a study and to formulate and publish a tentative plan, to be followed by a final plan, under which all railways would be consolidated into a small number of large systems of fairly equal financial strength and earning power. The Commission, however, was not given power to enforce its final recommendations. In defining the principles which should govern consolidation the law provided that competition should be continued as far as practicable, that existing routes and channels of traffic should be maintained as fully as possible and that the capitalisation of a new company

should not exceed the combined value of its consolidated properties.

In Aug. 1921 the Commission published its tentative plan of groupings, and hearings were held throughout the following two years. There was much opposition to the plan both in principle and detail and practically nothing definite had been done up to June 1926, except the authorisation of a few voluntary combinations.

The frequent reference to value as a rate-making base calls for a word of explanation. The value of a railway property has always been a controversial subject because of the several cases of "stock watering" or fictitious inflation of capitalisation in earlier years. In 1913 the Valuation Act directed the Interstate Commerce Commission to make a physical inventory of each railway property and to ascertain its value for rate-making purposes. Three alternative bases were to be used: (a) original cost to date; (b) cost of reproduction new; and (c) cost of reproduction new less depreciation. The Commission has concentrated its work on the cost of reproduction new less depreciation, appraising land on the values of adjacent properties. In addition to land values, and the depreciated reproduction cost of every physical unit, the Commission was instructed to take into account "other values and elements of value, if any." Presumably these were meant to include such things as going value and an allowance for material, inventory and working cash.

Contrary to the expectations of the sponsors of the 1913 Act the valuations, as determined up to 1926, indicate very little "watered stock." On the contrary the indications are that when the work is completed in 1927 or 1928 the aggregate so found will likely exceed the book value and the capitalisation of the carriers. In the meantime the Commission, in exercising its authority over rates and in recapturing net income, has used tentative figures, and in fixing individual rates, such as those on agricultural products, has been influenced more by other economic factors than fair return on value. (W. J. C.)

*Water Transport.*—In 1916 the Bureau of Census made a study of transportation by water. According to this report the tonnage employed on the Great Lakes and the St. Lawrence river in 1916 was 2,737,491 tons, as compared with 2,392,863 tons in 1906, a gain of 14.4%. The freight carried was 125,384,000 tons, as against 75,610,000 tons in 1906, a gain of 65.8%. Of this, 73,000,000 tons was iron-ore, 30,000,000 tons coal and 6,000,000 tons grain. The freight handled by the Lakes fleet represented nearly one-half (48.6%) of the water-borne freight shipments reported for the United States as a whole in 1916, as against 42.6% in 1906. Tonnage on the Mississippi river and tributaries declined greatly, from 4,412,000 tons in 1906 to 1,621,000 tons in 1916. Vessels operating on canals declined both in number and in tonnage. In 1906 the number of such vessels was 3,140, with a tonnage of 259,491; in 1916 the number was 2,049, with a tonnage of 196,426. There has been a decline in the tonnage in the New York State canals. On the Erie Canal, the yearly average for the period 1906-10 was 2,206,595 tons; in 1920 it was 891,221 tons; and in 1923, 1,626,062 tons. The freight carried on the Sault Ste. Marie Canal, connecting lakes Superior and Huron, fluctuated during the decade 1910-9, between 53,477,000 tons in 1911 and 91,888,000 tons in 1916; in 1923 it was 91,380,000 tons. Commercial traffic through the Panama Canal has steadily increased since its opening in 1915. In 1924, 26,995,000 cargo tons were carried by 5,230 vessels.

*Shipping.*—Owing to the great activity in shipbuilding during the World War the tonnage of the American merchant marine showed a marked increase between 1910 and 1921 rising from 7,508,000 tons in 1910 to 18,282,000 tons in 1921; 1924 showed a slight decrease. Nearly one-seventh, or 2,693,000 tons in the latter year, was employed on the Great Lakes. The tonnage on western rivers continued to decline, being only 138,000 in 1923 but rose to 164,000 in 1924. Sailing vessels decreased both in number and tonnage, and steam vessels declined in number from 12,452 to 7,736, but increased in size. The average tonnage of a steam vessel in 1910 was 394 tons; and in 1923, 1,914 tons. During the five years, 1911-5, the tonnage of new steam vessels

built was 1,003,345 tons; in the five years, 1920-4, 6,714,678 tons, or more than six times as much. New construction reached its peak in 1920, showing 3,660,023 tons; in 1924 it was only 145,493 tons. American shipping is engaged in two distinct branches of trade: coastwise trade between domestic points, and foreign trade. The tonnage in foreign trade increased from 1,019,165 in 1913 to 11,077,398 in 1921, declining to 8,794,000 in 1924. Coasting tonnage which in 1913 amounted to 6,817,000 tons rose to 8,911,000 tons in 1924. It is estimated that the new tonnage, constructed under the emergency of the War, represented an expenditure of \$3,000,000,000, a sum greater than the book value of all the world's merchant shipping in 1914, aggregating 49,000,000 tons.

A notable change has taken place in the nationality of shipping entering and clearing from American seaports. Until 1916 the tonnage of vessels sailing under foreign flags for many years was approximately three times as great as that under U.S. registry; in 1920 U.S. tonnage entered (32,119,103) slightly exceeded foreign tonnage (31,984,932). This supremacy was soon lost, the respective figures for 1924 being 29,628,000 and 38,664,000 tons. The total tonnage of vessels entering at all ports from foreign countries increased from 40,235,800 tons in 1910 to 68,292,000 tons in 1924, and the tonnage cleared, from 39,705,858 tons to 68,910,000 tons. The tonnage of British shipping entering at seaports of the United States averaged in the five-year period 1910-4, 17,900,596; in 1924 the tonnage was approximately the same, 17,628,290. German tonnage in the earlier period averaged 4,362,019; and in 1924, 1,338,706.

*Mails, Telephone and Telegraph.*—Postal statistics show a slight extension of post routes, exclusive of rural delivery routes, from 447,998 m. in 1910 to 467,896 m. in 1924; the number of city carriers from 28,715 to 43,829; the mileage of rural delivery service from 993,068 to 1,205,714; the number employed in railway mail service from 16,795 to 21,446; and the postal revenue from \$224,000,000 to \$573,000,000. The telephone was rapidly extended. In 1922 there were 37,265,958 m. of wire in this service, as compared with 20,248,326 m. in 1912. Of this mileage, 30,600,000 in 1922 and 15,100,000 in 1912 were in the Bell system. The number of daily exchange messages of the Bell system was 21.7 millions in 1910 and 36.8 millions in 1922; daily toll messages increased from 602,000 to 1,523,000. The number of employees of all systems in 1922 was 312,015. The telegraph systems have made but little extension in the past 20 years. In 1902 there were 237,990 m. of pole line, and 252,991 in 1922. The number of messages sent rose from 91.6 millions in 1902 to 181.5 millions in 1922; and the number of employees from 27,627 to 62,299. (See TELEGRAPH and TELEPHONE.)

The automobile became an important factor in terminal transportation. Motor-car registration increased fourteen times between 1913 and 1924, numbering (not allowing for duplicate registration) in the latter year 17,591,981. This represents a motor-car for approximately one-seventh of the population. (See MOTOR VEHICLES.)

**BIBLIOGRAPHY.**—Important volumes on special topics have been published by the Bureau of the Census, including *Street and Electric Railways 1912* (1915); *Telephones and Telegraphs 1912* (1915); *Transportation by Water 1916* (1920). The Interstate Commerce Commission issues an annual report, *Statistics of Railways*, Shipping statistics are published in the *Annual Report of the Commissioner of Navigation*. The annual volume, *Statistical Abstract of the United States*, published by the Dept. of Commerce, assembles data on internal communication and transportation, merchant marine and shipping. (D. R. D.)

**UNITED STATES LITERATURE:** see AMERICAN LITERATURE.

**UNIVERSAL LANGUAGE** (27.746).—The term International language (or IL) denotes a second, or auxiliary, language for international use, not a universal language to displace national tongues. As the world grows smaller, international travel, commerce, science, broadcasting, increasingly accentuate the necessity of some common tongue. Suggested solutions of the problem fall under three classes: (1) the revival of a dead language, (2) the internationalisation of a national language, (3) the creation of a language *ad hoc*.

*Latin and Greek.*—Latin was the IL of the Middle Ages. It still survives implicitly in the nomenclature of certain sciences, and in the liturgy of the Roman Church, but, as a committee of the British Association found, it is impossible to give the dead bones life. Even mediaeval Latin is inadequate to express current ideas of modern life. The great difficulty of Latin restricts its use to the cultured few, who least need an IL. If the pronunciation were settled, the grammar simplified, the vocabulary clarified and extended, it would be no longer Latin, and would please the Latinists least of all. The futility of refurbishing Latin for modern uses is demonstrated by the failure of such magazines as *Phoenix*, *Præco Latinus*, *Vox Urbis*, *Iuventus*. No teaching methods will make the average working man into a fluent Latin speaker. If Latin is inadmissible, we can certainly rule out Greek, Sanscrit and other dead languages. Nor does a proposal to utilise hypothetical Aryan (*Lipskith*, 1919) seem more practical.

If a national language is to be universally recognised as international, which shall it be?

*Modern Languages.*—English is widely taught, its use is extending; it has a rich vocabulary, a great literature, a simple grammar. But its accentuation and pronunciation are difficult, its idioms drive the foreigner to despair, its spelling is chaotic. Even if agreement could be reached on phonetic spelling (and reformers are widely at variance), this would make written English more difficult for the average European, for whom the present spelling facilitates recognition of the words.

French is spoken by many educated Europeans, and still maintains a precarious hold in diplomacy. Its lucidity is proverbial, but its spelling, pronunciation and grammar are a stumbling block, and it is intensely national in character.

Spanish, though easier, shows divergence as between European and American forms. The widely spoken Russian and Chinese offer insuperable difficulties. Malay and the Pidgins are so much simplified as to be totally inadequate. In any case it would be impracticable for an international body to adopt any one national language. A proposal to officialise Spanish in the League of Nations evoked a similar request from the Italians. This solution is indeed not one solution, but many, mutually exclusive. The difficulties of any national language are too great. To force it on the world would tend to debase it and split it into dialects. Patriotism and national jealousies are in the way. Why should all other peoples sacrifice their national pride and prestige to suit the convenience of one?

#### THE VARIOUS PROPOSALS EXAMINED

*Scientific Languages.*—There remains the creation of a suitable language on scientific principles. Of some 200 such schemes the vast majority are mere projects only. They may be roughly divided into (a) *a priori* (philosophical, arbitrary), and (b) *a posteriori* (based on one or more existing languages).

Most early schemes were of the *a priori* type alluded to by Roget in his *Thesaurus*. Solresol based on the seven notes of the scale (1817), Lingualumina (1875), Blaia Zimondal (1884), Cabe aban (1887), Zahlensprache (1901), are more recent examples. Such schemes are based on a classification of ideas translated into words bearing no relation to any other language. Obviously they depend on the caprice of the inventor; though usable as codes they impose a great strain on the memory. One such scheme still advocated is Ro, invented in 1904 by the Rev. P. Foster. It has some vocabularies, a monthly sheet *Roia* and as literature the first chapter of St. John.

It is, however, now generally agreed that the IL must be *a posteriori*. Unlike previous schemes, most post-Esperanto schemes closely resemble Esperanto and one another. Consideration shows that an IL should be international, easy for all, neutral, euphonious, phonetic, flexible, unambiguous, logical, regular, adaptable and tested by long-continued practical use on a large scale.

*Esperanto.*—Esperanto, initiated in 1887 by Dr. L. L. Zamenhof (1859-1917) is the only language which possesses all these characteristics. It is neutral and international in its elements,

logical and regular in construction, and as euphonious as Italian and Spanish, for which it is often mistaken. The grammar can be grasped in half an hour; every rule is without exception, the spelling is phonetic and the dictionary small. Nevertheless, it has literary power, beauty, precision, flexibility and power of growth. In nearly 40 years of testing it has never been found wanting.

There are some 4,000 Esperanto books, original and translated, including the Bible; and the literature is rapidly growing; 95 magazines appear regularly. The League of Nations has published a favourable memorandum (compiled from government reports) on the teaching of Esperanto in the schools of the world. The Paris Chamber of Commerce and the London County Council teach Esperanto in their commercial schools; the London Chamber of Commerce examines in Esperanto. In 1925 the International Telegraphic Union officially recognised Esperanto as a "clear language." The British Association in 1919 appointed a committee on IL, which in 1924 definitely recommended Esperanto as its choice. Twenty-seven European Broadcasting Stations were giving regular Esperanto transmissions in 1925 and 16 International Esperanto Congresses have been held, attended by 4,000 members from all parts of the world.

Esperanto has long passed the stage of theory; it is in truth "the living language of a living people." Esperantists, finding the language adequate, concentrate their energies on the organisation of linguistic intercourse, and look to use for the elimination of possible flaws. On a foundation they regard as sound they are rearing a superstructure of technical vocabularies with the co-operation of expert committees. The majority of IL partisans and literature are Esperantist.

*Ido*.—In 1907 two Frenchmen, Messrs. Couturat and de Beaufront, produced a modification of Esperanto which they named simplified Esperanto. Owing to Esperantist protests, the "linguo internaciona" was renamed Ido (an Esperanto word meaning offspring). The title was still under discussion in 1925.

The Idists claim that Ido is Esperanto rendered more scientific and natural; it has abolished accented letters, correlatives, the compulsory accusative, the agreement of the adjective with the noun. The supposed chaos of Esperanto derivation has been regularised by Couturat's rule of reversibility.<sup>1</sup> The unchangeable fundament of Esperanto has been replaced by the principle of infinite perfectibility. These changes, it is claimed, are so self evidently improvements, that the whole world must fall into line, and recognise Ido as the final solution of the problem.

The Esperantists energetically rejected the proposed changes as, though superficially attractive, in the main unacceptable, being based on misconceptions, introducing objectionable irregularities and complications, and destructive of the literary power and beauty of the language. In particular they opposed Couturat's principle of "reversibility" as *a priori*, arbitrary and contrary to linguistic practice and instinct. The "reforms" were supported by the authority of a 1907 "delegation," which the Esperantists ridicule.

Esperanto and Ido both admit all necessary international roots. The Esperantist Academy officialises new words, however, only after extended trial in literature. The Idists, occupied in perfecting their dictionary, have largely neglected literature. In this matter each may learn from the other.

The history of Ido has confirmed the faith of Esperantists, though it has driven some to ultra-conservatism. Ido at first changed with bewildering rapidity. It being impossible to propagate a language which changed in details every month, a temporary period of stability (to end in 1926) was eventually inaugurated, during which further changes were to be held in reserve. Notwithstanding this, the chief Idist grammarian, Dr. Max Talmey, advocates what he calls "Improved Ido" or "Ilo" or

<sup>1</sup> In word-building Couturat demands reversibility or two-way derivation; e.g., he holds that from a root like *Kron* "a crown," one must not form "to crown" by the simple addition of the infinitive inflexion; by starting from the infinitive and "subtracting" the suffix one should pass back to the idea of "coronation" and not "crown."

"Arulo" (Auxiliara Racionoza Universala Linguo), which is Ido considerably reformed. Time will show how far unity may be preserved by judicious yieldings in various directions.

Over 50 schemes have appeared of "reformed" Esperanto, "reformed" Ido or some compromise. It is easy for anyone with ambition and moderate intelligence to catch this *morbus linguificus*, and publish a slightly modified Esperanto, over his own name. None of these projects, however, has had any success.

Prof. R. de Saussure, believing that some minor features of Esperanto handicap propaganda, proposes to eliminate them while preserving the essential qualities of the language. From 1907 onwards a stream of experimental projects and literature has issued from his language laboratory—Antido I., Antido II., Lingvo Kosmopolita, Esperantido and finally, Nov-Esperanto (1925). His attitude of scientific detachment and research, however, has been widely misunderstood, and he remains a voice crying in the wilderness.

*Volapük*.—Volapük (see 28.178) was based 40% on English, but English arbitrarily altered almost out of recognition. Born in 1880 and at its height in 1888, it was practically dead in 1890. The grammar was wonderfully ingenious, but the vocabulary too arbitrary. Despite the protests of the inventor, the Volapük Academy decided to reform the language, but was immediately torn by dissensions. Spelin, Dil, Dilpok, Balla, Orba, Tal, Pankel and other stillborn schemes, corrected or exaggerated the defects of Volapük.

*Neutral*.—Mr. W. Rosenberger, a later director of the Academy, initiated reforms of Volapük which resulted in an entirely new language, Idiom Neutral (1898). The "Kadem bevüretik volapüka" became the "Akademi de Lingu Internasional." Neutral, and especially a later form, Reformed Neutral (1907), represented the extreme swing of the pendulum to the *a posteriori* side, being almost exclusively neo-Latin, to this end sacrificing logic, beauty and simplicity. Prof. H. Sweet, who in the *Encyclopædia Britannica* in 1911 (9.773) damned Esperanto with very faint praise, wrote "the most formidable rival of Esperanto is unquestionably Idiom Neutral." Nevertheless, Neutral died with Rosenberger in 1918.

*Interlingua*.—In 1908 the Akademi passed under the directorship of Prof. G. Peano, and is now the "Academia pro Interlingua." Following Henderson in Lingua (1888) and Latinesce (1901) and Rosa in Nov-Latin (1890), Prof. Peano in 1903 proposed a systematic simplification of Latin called Latino sine Flexione (afterwards Interlingua). He practically discards all grammar as unnecessary. Interlingua is attractive to the classical scholar; its appearance is not undignified. Lacking specific tense-forms, it seems more suited to mathematical or philosophical exposition than to a narrative, lyric or dramatic style. One variant of Interlingua is that by Aldo Lavagnini, who by grammatical additions has changed it through the various stages of Interlingue and Unilingue to Monario (1925). A magazine in Monario appeared in 1926.

*Occidental*.—Mr. E. de Wahl, after experimenting with many systems, finally produced Occidental, "comprehensible at first sight to 10,000,000 educated Europeans without preliminary study." To write or speak it is less easy than to read it, variety being dearly bought by the introduction of irregularities.

*Other Schemes*.—Josef Weisbart, an ex-Idist, brought out in 1909 a project Unial, which in 1912 became Europal, and in 1923 Medial. This also "non successit." In 1925 appeared a new version, Europan. A magazine *Le Bon Europano* is announced for 1927. Europan claims to be a compromise between *latinitae* and *germanitae*; in other words, between Esperanto, Ido, Interlingua and Occidental. Details are still in the melting pot. Sidni Bond in 1912 published a rather vague scheme Omnez, superseded in 1913 by Domni (afterwards Optez). This also he has dropped, and is now at work on Meso.

Romanal is a project by Mr. A. Michaux, who nevertheless remains an active Esperantist. His aim is to show that an acceptable language may be constructed on a latin vocabulary like that of Courtonne (Neo-latine, 1885) derivation being based on Esperanto as opposed to Ido; in other words, a combination of

Interlingua vocabulary, Esperanto derivation and Mischeaux grammar. Prof. A. L. Guérard apparently regards Romanal as near the ideal.

A non-partisan body, The International Auxiliary Language Association (525 West 120th street, New York City), was formed in 1923 to collect and distribute information, initiate experiments and awaken interest on all phases of the problem. This may lead to an authoritative decision by some competent international body or group of governments powerful enough to carry the world with it. Or, at worst, it may result merely in the creation of some new competing scheme.

Meantime it seems practical to sympathise with the Resolution passed by the World Congress of International Associations in Brussels, 1920:—

Recognising the ever-growing need for an auxiliary language, the Congress expresses the desire that every person who is convinced of such a necessity adhere to the important Esperanto movement, deferring all improvements which may be deemed necessary until the moment when the language has been officially adopted by the governments, and to regard other schemes as interesting branches of experimental research.

**UNIVERSE: ELECTROMAGNETIC-GRAVITATIONAL SCHEMES.**—Einstein's theory of relativity (*q.v.*) unifies the mechanical properties of the world with the geometrical properties. The experimental methods by which we find out mechanical quantities (mass, momentum, stress, etc.) are not essentially different in nature from those by which we find out geometrical magnitudes (length and, for four-dimensional geometry, duration). Einstein's theory combines them all in one scheme so that the mechanical quantities are not extraneous things residing in space-time—they are characteristics of it. For example, mass and momentum are components of the curvature of space-time.

But in the original theory the electromagnetic field stands aloof—in space but not of space. The discrimination seems unnatural. We desire to find a single continuum—call it *space*, *aether*, *relation-structure*, what you will—such that all quantities ascertained by experiment shall be measures of intrinsic properties. There should be no discrimination between geometrical, mechanical and physical magnitudes, and no division into characteristics of the continuum and characteristics of “fields” disturbing the continuum. The Maxwellian electromagnetic field is described by a scalar potential  $\Phi$  and a vector potential  $F, G, H$ . These are combined in a four-vector:

$$\kappa_{\mu} = (-F, -G, -H, \Phi) \quad (I)$$

Riemannian geometry is completely described by 10 parameters  $g_{\mu\nu}$  which have already received geometrical and mechanical interpretation, and our first problem is to find a more general geometry (or description of a continuum) requiring 14 parameters so as to leave room for the four parameters  $\kappa_{\mu}$ .

This problem was solved in a brilliant paper by Weyl in 1918.<sup>1</sup> In Riemannian geometry it is assumed that the difference between two neighbouring points is something that can be given a unique measure, so that any distance can be compared unambiguously with any other distance. Weyl pointed out that a more general geometry is obtained if lengths in different directions at the same point can be compared but not lengths at different points. It can be urged that the idea of “comparison at a distance” ought really to be as repugnant to us as “action at a distance.” In practice the comparison of a length in America with the standard metre at Paris is not a comparison at a distance; we can trace the intermediate steps by which the unit of length has been transferred by material conveyance or by triangulation to the place where the comparison is made. The assumption of Riemannian geometry is that the result does not depend on the intermediate steps—the route of transfer; this is

<sup>1</sup> H. Weyl, *Berlin Sitzungsberichte*, p. 465 (1918).

an assumption, not an *a priori* necessity, and the experimental verification only extends to a limited degree of accuracy. Let us consider the effect of rejecting the assumption.

Instead of a single standard of unit length we now require a standard unit at every point of space-time because the unit cannot be transferred from place to place unambiguously. This (arbitrary) collection of standards will be called a *gauge-system*. If a material rod of length  $l$  is displaced from  $(x, y, z, t)$  to  $(x+dx, y+dy, z+dz, t+dt)$  it will in general have a new length  $l+dl$ . It is meaningless to ask whether the change is due to a change in the rod or to a difference in the standard units at the two points. To the first order the most general expression for the proportionate change of length is

$$dl/l = \kappa_1 dx + \kappa_2 dy + \kappa_3 dz + \kappa_4 dt = \kappa_{\mu} dx_{\mu} \quad (2)$$

adopting the usual summation convention. Here the four  $\kappa$ 's are characteristic of the metric in the neighbourhood of  $(x, y, z, t)$ . We assume that these are the four extra parameters which we wanted, and accordingly identify them with the electromagnetic potential as in (1). Integrating over a finite path

$$\log(l_2/l_1) = \int_1^2 \frac{dl}{l} = \int_1^2 (-Fdx - Gdy - Hdz + \Phi dt) \quad (3)$$

The integral will be independent of the route between the points 1 and 2 if the integrand is a perfect differential; the condition for this is

$$-\partial F/\partial t - \partial \Phi/\partial x = 0, \quad \partial H/\partial y - \partial G/\partial z = 0, \text{ etc.}$$

The left sides are the usual expressions for the components of electric and magnetic force. Hence the vanishing of the electromagnetic field is the condition that  $l_2/l_1$  may be independent of the route, *i.e.*, the condition that comparison of lengths at different places may be unambiguous.

The arbitrary gauge-system is irrelevant to the actual phenomena just as an arbitrary co-ordinate system is. By a transformation of gauge a length  $l$  becomes  $\lambda l$ , where  $\lambda$  is an arbitrary function of position. It easily follows from (2) that by this change we get new parameters  $\kappa'_{\mu} = \kappa_{\mu} - \partial(\log \lambda)/\partial x_{\mu}$ . The interesting point is that we can identify either  $\kappa'_{\mu}$  or  $\kappa_{\mu}$  with the electromagnetic potential; it is well known that the latter is indeterminate to the extent that the gradient of an arbitrary function can be added without altering the electric or magnetic force.

A really absolute property of the world should be invariant for transformations not only of the co-ordinates but also of the gauge; hence has arisen a study of gauge invariance and covariance. For example the Riemannian invariant of curvature  $G$  is in this generalised geometry replaced by  $G - 6(\kappa^{\alpha})_{\alpha} + 6\kappa_{\alpha}\kappa^{\alpha}$ . Weyl has pointed out that there exists a simple set of completely invariant quantities in a world of four dimensions which have no parallel in a world of more or fewer dimensions.

Although this theory finds a place for the electromagnetic quantities in the geometry of the continuum, it is incomplete in that the most characteristic manifestations of electrical conditions are not predictable from their geometrical specification. There is an interaction between the electromagnetic and the mechanical quantities, appearing as the ponderomotive force exerted by an electromagnetic field on its own singularities (electric charges). Having removed the Riemannian restriction, we have now to impose some other restriction on our generalised geometry so that the  $g_{\mu\nu}$  and  $\kappa_{\mu}$  will interact according to the law of ponderomotive force. It has been sought to represent this restriction (or additional axiom of our geometry) in the form of a principle of least action. This part of the theory is not so satisfactory. Least action applied to 14 parameters gives 14 equations; we require only 10 equations to express the observed law of ponderomotive force; the remaining four give relations between the electric current and potential which are useless to us and have to be explained away as undetectable by observation. A more serious difficulty is that the only action invariants which lead to agreement with observation are artificial in appearance, as though nature had failed to display her usual artistry. Least action seems to fail here because it attempts to jump by a formal

device a territory comprising the problems of electron structure and quantum theory requiring other conceptions than those of field-physics. The value of the Hamiltonian method of variation of world-invariants has perhaps been misunderstood; its importance is that it follows the kind of dissection which we ourselves have made when we analyse the world into *things* existing in *space* and *time*. But that application has nothing to do with a governing law of the continuum.

A generalisation of Weyl's geometry has been proposed by Eddington.<sup>1</sup> In this theory lengths even at the same point are not initially comparable. The basal geometry is an affine (non-metrical) geometry supposed to be closely descriptive of the underlying relation-structure of the world; the conception of length is not introduced until later when things capable of measuring length have been found. The elementary relation in the world-structure is a four-vector called a *displacement* and it is postulated that there is a comparability of displacements sufficiently close together in the structure, so that we can pick out a displacement  $A^\mu + dA^\mu$  at  $x_\mu + dx_\mu$  which is in some sense "equivalent" to  $A^\mu$  at  $x_\mu$ . By following a chain of equivalent displacements completely round the boundary of an area  $dS^{\mu\nu}$  we find the final displacement  $A^\mu + \delta A^\mu$  associated with the initial displacement  $A^\mu$  with respect to the area  $dS^{\mu\nu}$ . It is found that  $\delta A^\mu = -\frac{1}{2} B^\mu_{\nu\sigma} \delta A^\nu dS^\sigma$  where  $B_{\mu\nu\sigma}$  is a tensor—the generalised Riemann-Christoffel tensor—which can be taken as descriptive of the general interconnection of the world-structure. Contracting this tensor we have a tensor of the second rank analogous to the Einstein tensor ( $G_{\mu\nu}$ ), but differing from it by having an antisymmetrical part  $F_{\mu\nu}$  as well as a symmetrical part  $R_{\mu\nu}$ . Thus from the basal relation-structure we have extracted two tensors  $R_{\mu\nu}$  and  $F_{\mu\nu}$  with which to build a physical world of space, time and things.

Connected with the displacement  $dx_\mu$  between two neighbouring points there is an invariant  $ds^2 = R_{\mu\nu} dx_\mu dx_\nu$ ; hence there is after all a unique measure associated with the separation of two points which may be called the *distance*. It will be seen that this is a deduction not an axiom of our geometry. If our experimental appliances are such as to get hold of this unique measure, then the geometry of space and time is strictly Riemannian as Einstein supposed. This is, of course, a partial reaction from the views described earlier in the article; Weyl's geometry is not an actual geometry of space and time, but his ideas are transplanted to a more fundamental domain and illuminate the study of the basal structure of the world. Weyl's own later views have moved in this direction. In his own words the extension of a material object is determined by *adjustment*, not by *persistence*; that is to say, the object does not try to connect its present dimensions with previous dimensions by a chain of equivalence; instead it takes up an extension in equilibrium with its present surroundings and therefore settled with respect to the invariants descriptive of the part of the world in which it is now situated.

In Einstein's theory  $ds^2 = g_{\mu\nu} dx_\mu dx_\nu$ ; hence, inserting a constant factor  $\lambda$  to allow for choice of units,  $R_{\mu\nu} = \lambda g_{\mu\nu}$ . As already stated  $R_{\mu\nu}$  is a generalisation of Einstein's curvature-tensor  $G_{\mu\nu}$ ; it contains additional terms supposed to represent the non-Maxwellian stresses in electrons, protons and quanta. Hence in empty space  $R_{\mu\nu}$  reduces to  $G_{\mu\nu}$ , and we have immediately Einstein's law of gravitation:—

$$G_{\mu\nu} = \lambda g_{\mu\nu}$$

The antisymmetrical tensor  $F_{\mu\nu}$  turns out to be the curl of a four-vector and can therefore suitably be identified with the electromagnetic force (which is the curl of  $\kappa_\mu$ ). In this theory geometro-mechanical and electromagnetic quantities are completely unified provided that we look at the basal structure; if we do not look so deep we find a bifurcation of the properties of the world into symmetrical and antisymmetrical and a corresponding distinction of space and entities in space.

As in Weyl's theory the ponderomotive force of the electric field involves some additional law not comprised in the original

geometrical axioms. Einstein<sup>2</sup> has sought to complete this affine theory by a suitable action-principle and his result probably represents the greatest advance yet made on these lines; but he himself is now of opinion that it is only formal and the true line of progress is not to be found that way. The fact is that, whilst these methods are adequate for field-physics, in the problem of the ponderomotive force field-physics impinges on atomic physics, for which a different order of conceptions seems necessary. The field theory has reached its limit and is awaiting the development of the quantum theory. (A. S. E.)

**UNIVERSE, MODERN CONCEPTIONS OF THE.**—For simplicity we begin by taking space of two dimensions only, that is, we consider processes taking place in a plane  $E$ , which is at rest. If we depict these processes by plotting  $t$ , the time, on an axis at right angles to the plane  $E$ , taken as horizontal, then the movement of a body proceeding uniformly in a straight line according to the law of inertia is represented by a straight line in the three-dimensional diagram; in particular vertical straight lines in this diagram represent the history of particles at rest. Such a line, the "graphic time-table" of a single particle, is called a world-line, after Minkowski; quite generally, on the world-line of a given particle lie all the space-time points which it occupies in the course of its history. On a  $t$ -constant plane drawn parallel to  $E$  through a given world-point  $P$  ("here and now") lie all points contemporary with  $P$ .

Such a plane separates the past and the future, which have their common frontier in this plane of the present. Only events belonging to the *future* half of the world can be influenced by  $P$ , while on the other hand what happens in  $P$  is subject only to actions localised in the *past* half of the world. Now according to the theory of relativity, the function of separating past and future in the causal sense is not attributed to the plane through  $P$  just

FIG. 1.

discussed but to the *light-cone* through  $P$ , that is, the cone on which lie all world-points which are traversed by a light signal originating in  $P$ . If in our graphical picture the scale is chosen so that the time interval of one second on the  $t$ -axis is as long as the length 300,000 km. in the  $E$ -plane, this light-cone is a right circular cone, of apex angle  $90^\circ$ , with its apex at  $P$ . If it is produced backwards it divides the world into three regions, the past, the future and the intermediate region, with which last  $P$  is not causally connected. (It may be noted that if the velocity of light be made infinite the cone becomes a double plane which separates the past and the future as considered above.)

**Relativity and Recent Theories.**—The causal structure of the world is given by light-cones radiating from all points which separate past and future; its inertial structure is known if the world-lines of the massive points moving without impressed forces, the so-called geodesics, are selected from all possible

<sup>1</sup> A. S. Eddington, *Proc. Roy. Soc., A*, 99 p. 104 (1921).

<sup>2</sup> A. Einstein, *Berlin Sitzungsberichte*, pp. 32, 76, 137 (1923).

world-lines. According to Einstein's general theory of relativity, gravity and inertia are indissolubly connected in one unifying scheme, so that, for example, the motions of the planets follow geodesic world-lines. The causal and the inertial structure of the world is, on that theory, reciprocally connected with matter; on the other hand, before the theory was formulated this structure was considered as a fixed feature of the world, given *a priori*, governing matter, but not influenced by matter, as expressed in the drawing on the preceding page. We need not discuss how both together, constituting a field of measurement, determine the measurements made with rigid bodies and clocks.

Finally, the electromagnetic field has to be considered. The merging of this with the field of measurement into a single world-geometry has been the subject of recent theories of H. Weyl ("Gravitation und Elektrizität," *Sitzungsberichte Berliner Akademie*, 465, 1918), of A. S. Eddington "A Generalisation of Weyl's Theory of the Electromagnetic and Gravitational Fields," *Proc. Roy. Soc.*, vol. 99, 1921; and of A. Einstein ("Zur allgemeinen Relativitätstheorie," *Sitzungsberichte Berliner Akademie*, p. 32, 1923; "Einheitliche Feldtheorie von Gravitation und Elektrizität," *ibid.*, 414, 1925). The final success of these theories is still in question. In any case we distinguish between all this (which we call *field* or *ether*) and *matter*. G. Mie ("Grundlagen einer Theorie der Materie," *Annalen der Physik*, vol. 37, 39, 40, 1912 and 1913), has attempted to do away with this dualism, and to merge matter in the field. Even though he may have succeeded in finally destroying the old naïve representation of matter as a substance, yet the physics of matter is developing to-day along the lines of the quantum theory in quite another direction to that prescribed by the idea of a pure physics of the field.

**Gravitational Problems.**—Since Galileo—in contrast to Aristotle—physics has regarded the *infinite* space of Euclidean geometry as the theatre of material events. This assumption leads to serious paradoxes in astronomy. If the masses in the universe are distributed on a large scale uniformly, then the Newtonian law of gravitation leads to an infinitely great value of the gravitational potential at every point. We must on this assumption consider, not the nearest large masses—the earth, the moon, the sun—as predominating in their gravitational action on us, but the most distant masses. Further, the same reasoning would necessitate the heavens being infinitely bright. We can get over these difficulties by the contrasting picture of space as occupied by matter of perceptible density in a certain limited region only, the density decreasing, as we go out along  $r$  from this central region, more rapidly than  $1/r$ . This, however, is unsatisfactory as attributing a preference to certain parts of space. Further, Einstein has shown that such an island or cluster of stars must gradually become depopulated: every now and again so great a fraction of the total energy would unite in one star that this star would be slung off towards infinity on a hyperbolic path like a comet.

A way out of this dilemma is provided if we choose to modify the Newtonian laws of gravitation. (Attempts, based upon a fundamental idea of Lambert's, have also been made to overcome the difficulties by the assumption of a hierarchy of systems increasing without limit in order of magnitude. Recently C. V. L. Charlier has taken up this line [*Ark. för. Mat. Astr. och Fysik*, vol. 16, no. 22, 1922]). From the standpoint of the theory of action in proximity, it seems simplest to replace the equation for the gravitational potential  $\Phi$  in empty Euclidean space with co-ordinates  $x$ ,  $y$  and  $z$ , namely the equation

$$\Delta\Phi = \frac{\partial^2\Phi}{\partial x^2} + \frac{\partial^2\Phi}{\partial y^2} + \frac{\partial^2\Phi}{\partial z^2} = \sigma \quad (1)$$

by the equation

$$\Delta\Phi - e^{-\epsilon r}\Phi = \sigma$$

where  $\epsilon$  is an exceedingly small positive constant. The Newtonian potential satisfying equation (1),

$$\Phi = \frac{M}{r},$$

which decreases in inverse proportion to the distance  $r$  from the body producing the field, becomes

$$M \frac{e^{-\epsilon r}}{r}.$$

The factor  $e^{-\epsilon r}$ , decreasing exponentially with  $r$ , cuts out the action of very distant masses, and represents what we may term a kind of absorption of gravitation. On this assumption, the chief importance is assumed by stellar masses which are separated

from us by distances of the order  $R = \frac{1}{\epsilon}$ , so that a slight lack of

isotropy in the distribution of such stellar masses would lead to enormous accelerations.

**Nature of Space.**—Einstein applied the same ideas to his gravitational equations ("Kosmologische Betrachtungen zur allgemeinen Relativitätstheorie," *Sitzungsberichte Berliner Akademie*, p. 142, 1917) and reached the result that space is not infinite but closed. If we consider two dimensions only, space is not a plane, but of the nature of a spherical surface which runs into itself in all directions. The spherically closed space, without boundaries, yet finite, to which Einstein was led, is, of course, something quite different from the limited spherical universe of Aristotle. The distance  $R$  introduced above is the radius of this space, that is, the volume is of the order of magnitude  $R^3$ . In mathematical terminology, we term such differences between surfaces as cannot be abolished by a continuous deformation *topological* differences. Thus a plane differs topologically from a spherical surface, for a closed surface always remains a closed surface, however it be deformed, without tearing. The sphere, again, differs topologically from the torus, or anchor ring, although this is also closed. Three- and four-dimensional continua can also possess a variety of topological differences, just as can surfaces. The first and most important question in all speculations on the world as a whole is as to the topology of the space of our world. The generalised theory of relativity, by dispensing with Euclidean geometry, has left the door open for possibilities of every kind.

**Phenomena of Inertia.**—At every point of spherical space masses whose distance is of the order  $R$ , i.e., the totality of cosmic masses, will produce an effect enormously greater than the gravitational action of the nearest star. This result, so baleful for the Newtonian theory, is just what Einstein wants: this enormous effect comes to light in the *phenomena of inertia*. By the theory of relativity gravitation is merely a slight fluctuation of the inertia field, which is on the whole homogeneous. This inertia field may be compared to a high table-land, on which in isolated localities, corresponding to the neighbourhood of stars, small hillocks arise. If  $c$  be the velocity of light, then

$$\frac{\phi}{c^2} = \frac{\mu}{r} \quad \left( \mu = \frac{M}{c^2} \right)$$

which is a pure number, measures the magnitude of the local fluctuation in comparison to the strength of the homogeneous field. The magnitude  $\mu$ , which is of the dimensions of a length, gives the gravitational radius, proportional to the mass, of the body producing the field; for the sun it is less than a mile. Newton's belief can be stated as follows: The plane in which Foucault's pendulum swings remains fixed in absolute space, and the fixed stars are apparently at rest in absolute space; hence the plane of the pendulum goes with the fixed stars, and rotates relatively to the earth. On the other hand, Einstein, in harmony with Mach, declares that this absolute space is a mere ghost, a superfluous intermediary; the actual enormous masses of the fixed stars of the cosmos really control the plane of the pendulum.

The conclusion that this conception demands a closed space can be reached in the following way: The laws of action in proximity for empty space summarised in equation (1) do not determine fully the Newtonian potential until we add the condition that the potential is in general at a level  $\phi = \sigma$ , matter merely causing a departure from this value which becomes negligible at a great distance. The ether, and in particular the field of inertia, is in a determined state of rest so long as no matter is about, and

is slightly disturbed by the presence of matter. If, however, space is closed, the laws of action in proximity determine the potential uniquely, *i.e.*, the state of the ether is not so much modified by the matter as produced. Correspondingly Einstein found that a world without matter could not be reconciled with his cosmic equations—at any rate, if it were assumed to be “static.” He found that the total world-mass must stand in a precise relation to its spatial extent: the gravitational radius of the world-mass must equal the geometrical radius,  $R$ , of the sphere of space. This result need not be ascribed to a pre-established harmony; the total mass which happens to be present in

the world determines the cosmic constant  $\epsilon = \frac{1}{R}$ . Einstein

further invoked the closed character of space to explain the remarkable fact that the velocities with which the stars are moving relatively to one another are so much smaller than the velocity of light which is the norm. He compared the stars in closed space to gas molecules shut up in a stationary vessel and interpreted the comparative quiet which reigns in the cosmos as the effect of a thermodynamic adjustment, that is, as a steady state of equilibrium which has gradually resulted from a probably much stormier past.

*Main Difficulties.*—Attractive as the Einstein cosmology appears at first sight it is open to many objections. A fundamental consequence of the theory of relativity is that matter alone cannot determine the course of events in the world, for of the three characteristics of matter—charge, mass and motion—the third disappears, since without reference to the field the conception of the motion of separate bodies relative to one another is as indefinite as that of absolute motion. Further, W. de Sitter has shown (“On Einstein’s Theory of Gravitation, and its Astronomical Consequences,” *Monthly Notices, Royal Astronomical Society, London*, vol. 77, 1917) that Einstein’s equations can be reconciled with a world empty of mass. Admittedly such a world would not possess a static character, but it is more homogeneous than Einstein’s world in so far as, in harmony with experience, all geodetic motions are of the same inner nature, and rest is not distinguished among them. Finally, there is no observational indication that, even adopting the largest scale for our measurement, the stars are uniformly distributed, and comparatively small departures from homogeneity would, on Einstein’s scheme, lead to enormous forces. “The present state of the stars is certainly nothing like a final statistical state. The small velocities of the stars are far more likely to be due to a common origin than to an adjustment.

To describe completely the homogeneous normal state of the universe, which is fundamental for cosmology, time must be added to space. We abstract two dimensions from space, so that the space-time continuum becomes a surface, and can be depicted by ordinary figures in two dimensions.

*Elementary Cosmology.*—The universe is represented by a vertical plane. The straight lines on it are the geodetics, the light cone from a point  $P$  is represented by two straight lines through  $P$  making an angle of  $45^\circ$  with the vertical. The electromagnetic field is zero. The stars are distributed in infinite dilution and are at rest, *i.e.*, their world-lines are all vertical straight lines.

*Einstein’s Cosmology.*—The plane becomes a right circular cylinder, the axis of the cylinder having the direction of the vertical time axis. Geodetics are ascending spirals, cutting the vertical at a constant angle. The light cone from  $P$  is represented by the two spirals through  $P$  making an angle of  $45^\circ$  with the vertical. The electromagnetic field is zero. The world-lines of the stars are again vertical straight lines; the density of cosmic mass distribution is not infinitely small, but stands in a determined relation to the radius of the right section of the cylinder (*i.e.*, of world-space).

*De Sitter’s Cosmology.*—The universe appears as a hyperboloid of one sheet. Geodetics are hyperbolae given by the intersection of the surface with planes drawn through the mid-point of the hyperboloid. The light-cone consists of the two

straight-line generators through the origin. The electromagnetic field vanishes. The distribution of the stars is infinitely dilute.

*Weyl’s Hypothesis.*—On Weyl’s supplementary hypothesis the world-lines of the stars form a sheaf, which rises in a given direction from the infinitely distant past, and spreads out over the hyperboloid in the direction of the future, getting broader and broader. It is traced on the surface by all planes passing through a fixed position of the generator of the asymptotic cone.

In the first case, the universe has a single, coherent, infinitely distant border, while in the second and third cases, there are two borders, the infinitely distant past and the infinitely distant future: the universe stretches from eternity to eternity. This is the essence of the doctrine of closed spaces. The world-line of a permanent body, say an electron, will originate in the one border and proceed to the other border, whereas in the first case, no reasonable rule can be devised to forbid the world-line of a body returning into itself, or nearly into itself. This would lead to the most gruesome possibilities of ghostly doubles and meeting oneself. On the Einstein cylinder the light cone crosses itself infinitely often; thus an observer must see an infinite number of images of one and the same star. However, between the different states of the star to which these images correspond an aeon has passed, namely, the time which light takes to go once round the universe. The perception of what is now happening is haunted by the ghosts of events of very long ago.

De Sitter’s hyperboloid unites the advantages of both the former schemes: the double border of past and future on the one hand and the light cone which does not cross itself on the other hand. In the cosmology of the first case there is no reason why the world-lines of the stars should be (nearly) parallel to one another; in the Einstein scheme this fact is referred to a statistical adjustment; by De Sitter’s view, the “sheaf” arises from a common origin of the stars, from the postulate that the stars of our system have had from the beginning a causal connection with one another. (This postulate, by the way, is not satisfied by world-lines chosen at random.) They seem to radiate out from an arbitrarily chosen central star; their spectral lines should therefore be displaced towards the red end of the spectrum for an observer on the central star. Now the spiral nebulae, which are probably the most distant celestial objects, show, with few exceptions, a strong displacement of their spectral lines towards the red. If the cosmological interpretation of this fact is correct, the distance of the spiral nebulae is comparable with the radius of the universe, and we derive for it a value of about  $10^{27}$  centimetres. On De Sitter’s hypothesis the ether is only slightly disturbed from its state of rest by the presence of matter. The fact that the inertia compass and the star compass indicate almost exactly the same direction is not to be explained by the action of the stellar masses but by the powerful *supremacy of the ether* in the interaction between ether and matter.

It is, however, possible that the gravitational constant and, together with it, the inertial mass of a body is determined not alone by the nature of the body (its gravitational radius), but depends on the total mass which happens to be present in the universe. A circumstance which seems to favour the supposition is that the gravitational constant falls right outside the scheme of the other physical constants. The gravitational radius  $\mu$  of the electron is more than  $10^{46}$  times as small as the radius  $\rho$  (approximately  $10^{-13}$  cm.) calculated from its charge and inertial mass. In some way or another this must depend upon the disproportion between electron and universe. The simplest hypothesis which we can make would be to suppose that the radius  $R$  of the universe is to the radius  $\rho$  of the electron as  $\rho$  is to  $\mu$ . This does, as a matter of fact, lead to the same order of magnitude for  $R$  as is found by measurement for the distance of the spiral nebulae, and by the cosmological interpretation of the shift of their spectral lines.

K. Lanczos has still another hypothesis, that of a universe conceived to be in stationary rotation “Über eine stationäre Kosmologie im Sinne der Einsteinschen Gravitationstheorie,” *Zeitschrift für Physik*, vol. 21, 1924). No point at which the

theory can be checked by astronomical fact is reached. It is, however, important to keep constantly in mind the new kind of interpretation which the relativity theory has rendered possible. (See also RELATIVITY; TIME-SPACE.)

**UNIVERSITIES** (see 27.748).—A striking feature of university development since 1910 is the increase in the number of universities. It is difficult to quote precise figures, because full information regarding the universities in the Union of the Soviet Republics, in China and in some of the Latin American countries is not available; there are also institutions, particularly in the United States of America, which are termed universities but do not perhaps entirely conform to the usual meaning of that word. The total number of universities all over the world, which was certainly not more than 370 in 1910, approached 450 in 1926; an increase of at least 21%.

Thirteen new universities have been founded in western Europe since 1910, most of them after the War.<sup>1</sup> In the so-called "new countries" of Central Europe, including the Baltic and Balkan states, 16 new universities have been established, almost all of them since the War;<sup>2</sup> many of the elder universities in these countries have been entirely reorganised. In Russia, White Russia and Ukraine several universities were inaugurated during the War, and a great many came into existence after the revolution. Some of the latter were soon closed. Instead of the 7 universities which existed in 1910 on the present territory of the Soviet republics, there are now about 20. The general increase in Europe is approximately from 143 to 186.

This development is not less remarkable on the other continents. Where many universities had come into existence during the 19th century only a few foundations are to be recorded since 1910, some of which were reorganisations of older institutions.<sup>3</sup> In Latin America at least ten new universities<sup>4</sup> have been created since that year. In South Africa, which had one university only in 1910, there are now four. India possessed only five universities in 1910 and has now 20, including two women's universities and the International University founded by Rabindranath Tagore. Two new Imperial Universities have been founded in Japan since 1910, so that the number in that country, including the private universities, now reaches 15. In China, where university life is still in formation, we find now at least 10 or 12 universities. Further foundations in other Asiatic countries, such as Palestine (the Jewish University of Jerusalem was inaugurated in 1925, the Catholic University, later Persia, Siam, Australia (University of Perth, 1911), and even in Hawaii (1920) have also to be recorded.

<sup>1</sup> Lisbon, Porto and Reykjavik in 1911; Frankfort 1914, Murcia 1915; Hamburg and Köln 1919, Milan (Catholic) University 1921; Milan (Royal University) and Nimeguen 1923; Bari and Florence 1924.

<sup>2</sup> Debreczen in 1914; Lublin 1918; Abo-Turku (Swedish University), Bratislava (started as Hungarian University of Pozsony in 1914), Brno, Ljubljana, Poznań, Riga, Skopje (Fac. of Philosophy only), Subotica (Fac. of Law only) and Wilno in 1919; Turku (Finnish University) 1920, Szeged 1921, Kaunas 1922, Pécs 1923, Salonika 1925.

<sup>3</sup> The Rice Institute at Houston (Texas) 1912, the University of Akron (Ohio) 1913, the Emory University at Atlanta (Ga.) 1915, the Catholic University of Montreal 1919, the Duke University at Durham (N. C.) 1925.

<sup>4</sup> The most important are the University of Rio de Janeiro and the "Universidad del Litoral" (of Argentina), both constituted in 1920.

**Number of Students.**—The considerable increase in the number of students in the great majority of the universities<sup>5</sup> is particularly striking in the United States. Columbia University, with 34,823 students (6,529 only in 1909-10), has now the largest enrolment of students in the world.<sup>6</sup> Paris, however, is first in regard to whole time students, of whom there were 21,455 in 1925. An extraordinary development is to be noted also in some universities of central Europe, like Athens (2,800 students in 1909-10, 8,512 in 1923-4), Belgrade (902 students in 1908-9, 7,500 in 1924), Bucarest (3,478 in 1909-10, 13,478 in 1924-5), Warsaw (1,263 in 1909-10, 9,419 in 1923-4).

In some universities the maximum number was reached in the years immediately after the World War, when thousands of students whose studies had been interrupted or postponed entered. In many cases, however, this increase continues even to-day, and is due both to the general increase of the population and to the increasingly democratic character both of knowledge and public life. In the faculties of law and medicine especially the rush of students is conspicuous. In many universities the increase in various departments of the faculties of arts and sciences is due to the development of university study among women. The very high and ever-growing percentage of women students, already the majority in some faculties of arts, is characteristic of contemporary university life. Since this movement started only in the first years of this century, it would be premature to make any statement about its consequences.

**University Teachers.**—The teaching staff has not increased in the same proportion, and must be regarded as inadequate when compared with the number of students.

**Institutes.**—University institutes, both for teaching and for research, have reached an extremely large number. Many universities possess more than 100 such institutions. This development is due to the adoption in almost all countries in modified forms, of the so-called "seminar" system, started in Germany during the 19th century, and to developments which found no place in the traditional university organisation; so new institutions, either connected with the old faculties or independent of them, were established.

A remarkable feature of university progress in the United States within recent years has been the enormous increase in endowments by private donors. An outstanding instance of this is afforded by Harvard University. In 1869 its endowment was \$2,257,990. This increased to \$22,716,700 in 1909. In 1919 it was approximately \$48,000,000 and in 1926 had reached \$70,000,000.

This increase in endowments is also paralleled as regards the number of teachers and students. In 1910 the total number of teachers in the universities and colleges was 24,667, and the students numbered 274,084. In 1925 the numbers were 56,279 and 726,124 respectively. The increase of women students being proportionately greater than that of men.

**Specialised Institutes.**—As to these institutions, two different methods have been followed. In most European countries there existed since the end of the 18th century many specialised institutions for higher education which, while independent of the universities, had obtained university rank. They were created mainly for the study of technical sciences, of agriculture, mining and forestry, of commerce, of fine arts and so on. In many cases the schools of education, of political science, of dentistry and veterinary medicine were independent establishments. The number of these institutions has already grown steadily. Since 1910 some 50 or 60 schools of this kind have been founded in Europe. In the more important centres of intellectual life, the number of independent higher schools surrounding the university has become very considerable. Paris attains undoubtedly the record with its more than 40 schools. In England, such

<sup>5</sup> There are notable exceptions, e.g., in Germany, where the University of Berlin had 14,034 students in 1909-10 and 10,566 only in 1924.

<sup>6</sup> New York University, in the same city, had 4,036 students in 1909-10 and 20,760 in 1925-6; for Temple University, Philadelphia, the same figures are 5,033 and 10,020; the University of California in 1906-7 had 3,684 students and 11,197 in 1925-6.

schools or "colleges" are usually affiliated with the universities. In other countries, mainly in America, but also in Great Britain, the British dominions, and some of the new European countries (e.g., Latvia, where the University of Riga has 11 faculties), all branches of higher education have been included in the curricula of the universities, which therefore possess faculties of engineering, applied science, veterinary medicine, agriculture, commerce, education, fine arts, music, etc. In some universities the number of faculties has doubled since the War.

**Faculty Organisation.**—In many universities of to-day there are faculties which are entirely different from the traditional ones. These again have been divided, owing to the developing needs of life and to the specialisation of science. Thus for theology, in some universities two or even three (e.g., Warsaw) different theological faculties have been formed, to meet the requirements of various denominations. Economic and social sciences have been separated from law and have formed a new faculty (e.g., Geneva). In some countries (e.g., France) a faculty of pharmacy has been created separate from the faculties of medicine, thus following the practice which has prevailed in America for many years. The division of the traditional faculty of philosophy into faculties of letters (arts, humanities) and sciences (natural and physical sciences), which started very early in western Europe, has strongly influenced the other countries. Since the War many universities in central Europe, even in Germany, have adopted this system. In several cases a special faculty of mathematics has been instituted.

**New Chairs.**—In all faculties, old and new, many new Chairs have been established for subjects which 10 or 20 years ago either did not appear at all or appeared only exceptionally in university curricula. These new Chairs and subjects may be divided into three groups. In the first place, new branches of science have developed into individual subjects, e.g., radiology, or have been recognised as independent sciences, e.g., sociology, and therefore Chairs have been founded for their teaching. In the second place, the closer association of universities with practical life has necessitated the establishment of new Chairs for various branches of applied sciences, even for subjects like journalism and nursing. Finally, it has been realised that knowledge of foreign nations needs an intensive study not only of their languages but of their whole civilisation: history, literature, political institutions, economic conditions and so on. Therefore not only many new lecturers have been appointed for teaching languages, but chairs have been founded for the systematic and comprehensive teaching of what in Germany is called "Auslandskunde."

**National Institutes.**—Studies of this last order, which are particularly important for the future, are sometimes organised in special schools or institutes annexed to the faculties of letters and devoted to individual nations or groups of nations, as teaching and research institutes. In some cases these institutes, founded and maintained by the mother country, or even the mother university, have been placed in the country the knowledge of which was to be specially studied. This system was first adopted by France (the "Institut français à l'étranger," first founded at Florence in 1908, exist now in some ten countries) and then followed by other nations like Great Britain, Spain, Hungary, etc.

**Post-graduate and Research Work.**—The measures taken for furthering research work, especially of post-graduates, are mainly of two different kinds. Frequently university "seminars" have been developed into research institutes grouping the students who wish to devote themselves to pure science. On the other hand, the system of fellowships which has been developed especially in the Anglo-Saxon countries offers to the students and post-graduates certain possibilities of continuing their research work.

**Specialisation.**—Despite these efforts for promoting research work in the universities, there is a serious and ever-growing danger for pure science. In the various specialised higher schools, and in the majority of the faculties, the studies tend to acquire a professional rather than a scientific character. Even in the

faculties of arts and sciences the majority of the students mainly seek to pass the examinations required for various professions. The professors have to devote most of their time to teaching duties, to examinations, to administrative business, and consequently are handicapped in research work. The years between graduation and a professor's chair are particularly critical for young university men, a very small minority of whom are independent financially. Fellowships as well as institutes where they can find temporary posts, are insufficient in number in most countries. In both cases the pecuniary return is inadequate, when compared with the cost of living and with the advantages offered by other careers.

The League's Committee on Intellectual Co-operation (see below) at its very first session pointed out two of the deeper causes of this danger. It desires "to stimulate pure scientific work and to increase general learning, with a view to combating an excess of specialisation and professionalism." Specialisation is indispensable, but no subject can be studied satisfactorily in isolation from cognate problems. The student, instead of specialising hastily at the very beginning of his university work, should first obtain a certain amount of general culture. Professional utilitarianism induces the students to prefer those branches of science which lead to immediate practical application. While these sciences are not less important than others, their empiric study should be based upon more fundamental knowledge, and even these sciences cannot progress indefinitely without a simultaneous progress of theoretical investigations.

**Effects of World War.**—Still other, less general, reasons explain the very serious dangers observed in university life to-day. First of all are the consequences of the War. A whole generation of teachers and students was obliged to interrupt during four or more years its normal university work. The interruption of international exchanges isolated many countries or groups of countries. In the university libraries there are tremendous gaps which even now are far from being filled. Political problems have absorbed the thought of many thousands of intellectual workers, economic conditions have impoverished them and weakened their social position.

The first years after the War were not more favourable. After the conclusion of peace, between many countries a bad feeling remained which hindered intellectual relations of any kind; and it was (and sometimes still is) particularly strong in the universities. The delicate problem of national, religious and racial minorities has troubled university life in various places. In others, revolutions have simply destroyed it, at least for a certain number of years.

The economic situation after the War was still more unfortunate. The tendencies described above are explained, even justified, by the material needs of the moment. Exchange difficulties made it impossible to secure indispensable books and instruments, or to erect buildings to meet the needs of the new universities and of the enlarged old universities. Students and professors alike suffered misery in whole countries.

In spite of these dangers and obstacles, much has been achieved. There must be indeed in university life an extraordinary vitality which justifies the most ambitious hopes for the future. New intellectual forces have come into existence, and new forms of organisation have helped the universities to overcome the difficulties of the critical years, and will help them to continue their development in the future.

**Nationalism.**—During the whole 19th century, university life, which had been undoubtedly international in the middle ages and in the times of the Renaissance and the Reformation, became more and more closely connected with national development and national feeling. The World War and its consequences have rather strengthened this connection. In many territories which passed from one state to another the national character of the universities and higher schools changed with the political régime.<sup>1</sup> Many nations, especially in central and eastern Europe,

<sup>1</sup> The University of Strasbourg, German before the War, became French, the Russian Universities of Warsaw and Dorpat became respectively Polish and Estonian.

which before the War, owing to political conditions, had either no, or insufficient, universities of their own, have profited by their independence, creating universities as living symbols of their liberty and proofs of their intellectual progress or maturity. In all such cases university development has been directed by the national ideal.

*National Co-operation.*—In countries where the number of universities was large the necessity of promoting co-operation between the national universities began to be recognised more strongly. In 1910 the well-known "Office des Universités et écoles françaises" was founded in Paris. In 1912 the numerous universities of the British Empire held their first congress and decided to establish a common Universities Bureau, which started its activities during the War and a few years later organised the second Imperial Universities Congress. Similar offices came into existence in Switzerland, Italy, Belgium, Holland, etc. In the United States a similar rôle has been assumed by the various associations of universities, by the Institute of International Education in New York, and by the American University Union in Europe. These national organisations bring the universities of their own country into closer contact, and promote co-operation with the universities of other countries.

*International Co-operation.*—International university co-operation, which was almost entirely interrupted during the War, plays an extremely important rôle in the university life of to-day. Ambitious schemes have been proposed to organise it systematically. The project of an international university has been advanced on various sides. Up to now, this idea has been realised in a limited but perhaps more practical form by organising in various places international courses and summer schools, like those started in Brussels, Vienna, Geneva, The Hague (international law), Williamstown, Mass., etc.

*Exchanges of Professors and Students.*—International exchanges of professors and students have been recently facilitated by means of international conventions. General conventions of that kind being still impossible, such agreements have been concluded between one country and another (e.g., between France and a great number of other European nations since the War; also between various Latin-American countries) and between one university and another in the United States. Lecturers or series of lectures given occasionally by travelling professors in foreign universities are more frequent than exchanges of teachers in the proper sense. A practice has grown up in the United States and Canada of professors "visiting" other universities by invitation for the purpose of delivering lectures. Exchanges of students and, in general, study abroad have been facilitated by progress toward the international recognition of the equivalence of studies and degrees. While no general conventions have been concluded for this purpose, various countries have published official lists of foreign degrees recognised by their national universities.

Conferences of universities of two different countries (France and Switzerland in 1919, England and Switzerland in 1922) mark progress in that direction. Students who are more and more interested in international affairs have developed international associations. The International Students' Confederation founded in 1919, is the most representative of these federations. The splendid results achieved by the European Student Relief Fund of the World's Student Christian Federation and the activity of the International University Federation for the League of Nations<sup>1</sup> should also be mentioned.

*The League of Nations.*—All these problems have been taken up by the League of Nations, and carefully studied, since 1922, by its committee on intellectual co-operation. The International University Information Office, established by the committee in 1923, is the nucleus of the International Institute of Intellectual Co-operation, offered to the league by the French Govt. and opened in Paris in Nov. 1925. The institute's special section

<sup>1</sup> University women (post-graduates) joined in an International Federation which has devoted particular attention to the question of international fellowships; the Catholic students' associations have an international secretariat called "Pax Romana."

for inter-university relations publishes a quarterly bulletin containing information on international university development.

**UNIVERSITY EXTENSION.**—The older type of university extramural work, called officially university extension at Oxford and London and university local lectures at Cambridge, has continued to advance since 1910. Even during the World War a large number of courses were delivered, and numbers of men and women, with extra burdens of work and anxiety, welcomed the relief of turning their thoughts to inspiring subjects.

## I. THE WORK IN GREAT BRITAIN

The period has shown a remarkable development of university tutorial classes, begun by Oxford in 1908 and soon taken up by other universities. The system, like the older type, provides for lectures, discussion classes and paper work; but the membership is limited to a small number, formerly 32 and now 24, of students pledged to fulfil the conditions for three years. In 1910-1 the number of classes was 72 and students 1,829; in 1924-5 these had increased to 452 and 9,012 respectively.

*The Cambridge Jubilee.*—In 1923 a jubilee conference was held at Cambridge to celebrate the 50th year of the university local lectures, founded by Professor James Stuart in 1873. It was attended by representatives of most of the universities of the British Empire and of some American universities. The discussions ranged over the whole field of the teaching activities of universities outside their own walls.

*Summer Meetings.*—The summer meeting, which takes place at Oxford and Cambridge in alternate years, has been attended by several hundred students. The same universities, in addition to London, arrange summer courses for foreign students and for others. The tutorial classes summer school is now an important feature and is held annually at Oxford, Cambridge and other centres.

*Royal Commission Report.*—The Royal Commission on the ancient universities, which reported in 1922, urged that extramural instruction should be regarded "in all universities as an established and essential part of the normal work of a university." To this end they recommended "that a special inclusive grant of £6,000 a year be paid to Oxford and Cambridge Universities to enable them both to develop their extramural work and to assist in providing financial support for adult students" entering the university. A substantial part of the grant has been received, and both universities have formed new governing bodies on the lines recommended.

*General Developments.*—Other organisations are forming extramural boards, and one—University College, Nottingham—has appointed a professor of education, whose main duty is to organise and develop a department of extra-mural instruction. Consultation between different universities has become much more regular and systematic than it was.

The central joint advisory committee on tutorial classes, formed in 1909, was one of the first bodies to represent all the universities and university colleges in England and Wales. It also has direct representation of the joint committees, which manage the work in each case, and which include members nominated by the Workers' Educational Association. At the congresses of universities of the Empire, held in 1912 and 1921, a prominent place was given to teaching work outside the walls. The tutorial class movement has been specially successful in Australia, Canada and New Zealand.

Every university and university college in England and Wales is now conducting tutorial classes. Several are starting or re-starting university extension work of the older type, a development which has been made possible by the issue, in Aug. 1924, of new regulations of the Board of Education providing for grants in aid.

*Adult Students at the Universities.*—One of the most promising developments is the plan, recommended by the Royal Commission, of bringing up to the university adult students who have gone

through a course of extramural instruction. At both Oxford and Cambridge a number of such students are now in residence for at least a year, and experience is already showing that, besides widening their own outlook, they contribute an element of great value to the undergraduate life of the place. All will return to their homes with powers of greater service to the community, and many will become valuable teachers in the adult education movement.

## II. IN THE UNITED STATES

University Extension in the United States may readily be traced to the development in Great Britain of the idea of extending the influence and advantages of the universities of Oxford and Cambridge, which were serving only a small and select body of students. This movement whereby opportunities of university education were offered to the multitude was simply one phase of the general tendency to democratise education. It might well have found its origin in America, where the discrepancy between the cost of university education and the influence of universities upon the community was deeply felt.

The early form of university extension was that of the "lyceum" or short lecture course—not too profound, often illustrated, intended to entertain as well as instruct. Organisations were formed in certain cities the purpose of which was to maintain these cultural lecture courses. Soon the universities began to consider their obligation in this respect and departments of extension teaching were organised as part of the educational programme of important institutions of higher learning, particularly those located in urban centres. Although the short lecture course served a useful purpose, yet the lyceum as a means of education, with its difficulty of maintaining a balance between the serious and the entertaining, proved unsatisfactory. It became necessary to approximate much more closely the form of instruction followed in the established schools and offered to students in regular attendance. This implied, first, the transfer of university education to the homes of those who could not attend classes, and correspondence courses came into being. Again classes were organised in places within reach of the universities, and at hours convenient to wage earners.

The large universities of the West, the University of Chicago and the University of Wisconsin for example, built up great and important departments of correspondence study. In the East, however, the class system has prevailed, although some institutions use the lyceum and the home study system as supplementary to the classes held in the university halls and in extramural centres. This is notably true of Columbia University, New York City, which has built up a most elaborate system of adult education,—enrolling 16,500 students in 1925-6, in classes of University Extension and 4,000 students in home study. The original lyceum form is maintained in the Institute of Arts and Sciences. New York University and the college of the City of New York also have very large departments of University Extension and thus enroll many supplementary students.

There is a general feeling among certain universities and colleges of the country, particularly those in the East, that they have their own function to perform and that this would be jeopardised if they should supplement their classes by those intended for the irregular student. Thus, Princeton gives no indication of a desire to enter upon this work. Yale in like manner is cautious in its active interest in adult education. Harvard co-operates with Tufts College, Massachusetts Institute of Technology, Boston University and Wellesley College in offering courses of collegiate grade to qualified although not formally matriculated students. The state of Massachusetts has a well organised department of university education. There is no established policy in the universities as to credit for degrees for extension students.

The Western universities credit freely their correspondence courses. Columbia gives credit for class instruction but not for home study. Harvard grants credit in co-operation with other institutions toward a special degree, that of A.A., associate in arts.

It is interesting to note that early in the 19th century Columbia College initiated a series of lectures open to the public on the payment of a small fee. This movement was premature. In 1889 Teachers College, of Columbia University, commenced certain elementary courses in science for teachers, and, in 1897 courses were given throughout the academic year and counted for a diploma. In 1910 Columbia University established the department of University Extension which has grown to such remarkable proportions. The reports of the National Extension Association should be consulted by the reader who desires to study the development in detail of this side of higher education.

(J. C. E.\*)

**INTERMYER, SAMUEL** (1858– ), American lawyer, was born at Lynchburg, Va., March 2 1858. He was educated at the College of the City of New York and at the Columbia Law School (LL.B., 1876), was admitted to the bar in 1879, practising thereafter in New York City. He was counsel in many celebrated cases covering almost every phase of corporate, civil, criminal and international law. As counsel for H. Clay Pierce he prevented the Standard Oil Co., after its dissolution in 1910, from dominating the Water-Pierce Company. In the same year he effected the merger of the Utah Copper Co. with the Boston Consolidated and the Nevada Consolidated Cos., involving more than \$100,000,000. In 1903 he undertook the first judicial exposure of "high finance" in connection with the failure of the U.S. Shipbuilding Co., organised as a consolidation of the larger shipbuilding companies in America. After this he conducted a number of similar exposures. In 1911 he delivered an address entitled, "Is There a Money Trust?" which led the following year to the so-called Pujo money trust investigation in which he appeared as counsel, by the committee on banking and currency of the Federal House of Representatives.

Mr. Untermeyer for years urged such measures as the compulsory regulation of stock exchanges, reform of the criminal laws, the regulation of trusts and combinations and other economic legislation. He was counsel for many reorganisation committees, including those of the Seaboard Air Line, the Rock Island Railway, the Central Fuel Oil Co., and the Southern Iron and Steel Co. He took an active part in preparing the Federal Reserve Bank law, the Clayton bill, the Federal Trade Commission bill and other legislation curbing trusts. He was a delegate to the Democratic National Conventions in 1904, 1908 and 1912, and delegate-at-large for the State of New York in 1916. He was a strong supporter of President Wilson's administration. After America entered the World War he was adviser to the Treasury Dept. regarding the interpretation of the income tax and the excess profits tax laws. He was appointed by President Wilson to serve on the U.S. section of the International High Commission, which sat at Buenos Aires, in 1916, for the purpose of framing uniform laws for the Pan-American countries.

In 1920-1 he was counsel for the Lockwood Committee, appointed by the state Legislature to investigate an alleged conspiracy among the building trades of New York City. The charge was that labour leaders were using their power by extorting bribes for the prevention of strikes, by preventing independent bids and by forcing building awards to favourites. Many illegal acts were disclosed and numerous convictions secured. It was shown that in many of the building trades both manufacturers and dealers, often with the collusive aid of labour leaders, had organised to fix prices and prevent competition. Public opinion, especially in view of the housing shortage, reacted sharply to these revelations, and it was felt that Mr. Untermeyer's work in this connection had been performed with admirable public spirit, energy and courage. Mr. Untermeyer was an ardent believer in the Zionist movement and was president of the Keren Hayesod, the agency through which the movement was conducted in America.

**URBANISATION.**—The growth of cities has characterised the increase in the population of all countries. This urban tendency which has affected the whole social order of the modern world, continued almost unbroken until the World War. Since then, in the inevitable redistribution of population consequent upon a slowing down of industry, there has been a suggestion of a decrease in the movement both in Europe and America. The urban tendency is due to the promise of greater rewards for concentrated energy; to reduced areas for free colonising; to improved agricultural methods; to immigration; and to the tendency of foreign groups to concentrate in cities. (See also POPULATION.)

*Distribution of Populations.*—The extraordinary changes in population resulting from economic conditions have been statistically measured in the United States (see Table I), but in Europe enumerations have been detailed and systematic only in Great Britain and France. According to the most recent (available) censuses covering Europe (ranging from 1912–20) there were in that continent, exclusive of Russia, 291 cities having more than 50,000 inhabitants, representing approximately 20% of the total population. In the United States the corresponding percentage was 31.

TABLE I. *Distribution of Population in Groups of Cities Classified According to Size and in Rural Territory: 1900–20*

| Class of Places                        | 1920             |             | 1910             |            | 1900             |            | Per cent of total population |       |       |
|----------------------------------------|------------------|-------------|------------------|------------|------------------|------------|------------------------------|-------|-------|
|                                        | Number of places | Population  | Number of places | Population | Number of places | Population | 1920                         | 1910  | 1900  |
| Total Population of the United States  |                  | 105,710,620 |                  | 91,972,266 |                  | 75,994,575 | 100.0                        | 100.0 | 100.0 |
| Urban territory (inhabitants)          | 2,787            | 54,304,603  | 2,313            | 42,166,120 | 1,801            | 30,380,433 | 51.4                         | 45.8  | 40.0  |
| 1,000,000 or more                      | 3                | 10,145,532  | 3                | 8,501,174  | 3                | 6,429,474  | 9.6                          | 9.2   | 8.5   |
| 500,000 to 1,000,000                   | 9                | 6,223,769   | 5                | 3,010,667  | 3                | 1,645,087  | 5.9                          | 3.3   | 2.2   |

*Proportion of Urban to Total Population.*—Urban communities tend to grow more quickly than rural districts. This, and the continuous formation of communities have led to an increase of the proportion of urban to the total population of most countries. Even if the rate of growth in urban and rural communities were equal, there would nevertheless be a constantly increasing proportion of urban population, provided the population of the country were increasing. Were there no movement from country to city, no disturbing effect from international migration, and no difference between urban and rural communities with respect to the natural increase from excess of births over deaths, there would still be, in a growing population, a constant passage of certain communities from the rural to the urban class. The smaller towns, maintaining a rate of growth uniform with that of the country as a whole, would one by one pass the limit fixed for the urban population, thus increasing the proportion of urban population. In Great Britain and the United States, for instance, this process is continually operating. Mutual protection and social intercourse have been largely supplanted by manufactures and trade as the principal factors controlling the growth of cities.

All the principal countries have taken a census of population since 1920, but uniform methods were not followed in determining the size of the places to be considered as urban communities. As a rule, the population reported for these places resided within the city limits, but in some cases the city limits give only an inadequate idea of the population grouped about the urban centre. In large cities there are suburban districts outside the city limits, which, from many standpoints, form part of the city. Many of the residents have their business or employment in the city and to some extent, persons living in the city are employed in the sub-

urbs. This has led, in the latest census of England and Wales, to an inquiry as to place of work with reference to the place of residence.

The population of the world in 1926 was placed at 1,800 millions of which it is estimated that about 12% live in cities and in more or less urban territory whose population can definitely be established from late censuses; a more accurate percentage, namely 29% is to be found, however, by comparing the urban population with the total population of the countries in which they live. This estimate is complete, as it omits many of the densely populated cities of Asiatic countries, of Southern Europe, and of Russia, and—an important omission—the highly industrialised population of Germany. The largely rural character of other countries omitted, which have no official statistics of city growth, would however probably tend to offset the large urban figures for Germany.

There are no complete statistics showing the extent to which the population of the world has concentrated in urban districts, but data are available for some of the principal countries. In Table I. the urban population in proportion to the total is given for all the countries which have made this segregation.

*United States.*—As defined by the census, urban territory includes all incorporated places of 2,500 inhabitants or more, and in three New England states, all towns of that size; all other territory is classed as rural. The urbanisation of the population has been notable for the increase in the large cities. There are four cities in the United States that have a population of more than a million. China, Great Britain, Japan and India each has two cities of this class, and Argentina, Austria, Brazil, France, Germany, Russia and Turkey each has one city with more than a million inhabitants. In the United States there were only six cities in 1790 that had 8,000 or more inhabitants, and their population amounted to 131,472, forming 3.3% of the total population. At the census of 1920 there were 924 cities in this class, and they had 46,307,640 inhabitants, or 43.8% of the total. The census of 1920 was the first to show that more than half (51.4%) of the inhabitants resided in places having a population of 2,500 or more, the proportion having increased from 28.6% in 1880.

In many instances the population of the cities has been increased by the annexation of territory and the extension of the municipal boundaries so as to include suburban districts. The boundaries of some cities have been extended so as to entirely surround independent governmental districts. These districts being outside the corporate limits of the cities (although really within them), their population is not counted as part of the city. Highland Park and Hamtramck, Michigan, are densely populated communities, entirely surrounded by the city of Detroit, Mich., but their population is not included in the population of Detroit. A similar condition exists in Los Angeles, Cal., and in numerous other cities. (W. M. Str.)

TABLE II. *Total and Urban Population*

(This list comprises only countries which at recent censuses have segregated urban and rural population.)

| Country                                           | Census date | Population              |            |          | Urban defined                                                        |

<sup>1</sup> Does not include population (60,179) of Eupen and Malmédy.<sup>2</sup> Population estimate from 1925 *Statesmen's Year Book*.

**URBAN TRANSPORTATION** (see also **TRAFFIC PROBLEMS**).—Concurrently with the continuous growth of mechanically-operated industries, from their inception on a large scale following the application of steam as a source of power early in the 19th century, there has been in all industrial, as distinguished from agricultural, countries an increasingly marked drift of population to the cities. Of all the problems, whether old or new, created and intensified by this concentration of population in large cities, the most pressing is the furnishing of means of intra-urban transportation. This is especially the case in the large cities of Great Britain, Germany and the United States.

*Types of Service.*—Three types of transit services are now employed, the rapid transit railway, the street railway and the omnibus. On the rapid transit railways, both beneath and above the surface of streets which, in the largest cities of Europe and the United States, make possible long-distance high-speed intra-urban travel, the coal-burning steam locomotives have been replaced by electric motors (see **RAILWAYS**, **ELECTRIFICATION** or) attached to individual cars in the trains, which latter, on the Interborough subways, New York, are composed of 10 cars with a capacity of 44 seated passengers each and many more standing during the hours of maximum traffic.

**Rapid Transit Railways.**—Railways of this character will be described as rapid transit railways regardless as to whether they are locally known as underground, subways, tubes or elevated, and in like manner surface railways or tramways will be termed street railways. The greatest mileage of rapid transit railways and the system carrying the heaviest traffic in one city is in New York, which in 1925 amounted to 224.71 m., composed of 100.26 m. of two tracks, 77.48 m. of three tracks and 46.97 m. of four tracks. The street railway is almost universally worked by the overhead electric trolley or the underground slot system, as in the London area. It is criticised on the grounds that it is nonflexible, occupies permanently a considerable part of the roadway, and is liable to working troubles which occasionally suspend traffic over a wide area.

**Intensity of the Problem.**—The intensity of the urban transportation problem and particularly the demand for high-speed long-distance service is greater in American than in European cities due, in part at least, to the greater activity of the people, to the higher average scale of wages enabling the population to pay for transportation service and to the fact that the cities themselves are in large part the product of modern industrial development.

The measure of the problem is given in the statistics of passengers carried by the several means of travel and for comparison London and New York, respectively the largest cities of Europe and America, are taken for the years 1905, 1915 and 1925, the totals being stated in millions.

| Type            | 1905  | 1915  | 1925  |
|-----------------|-------|-------|-------|
| LONDON          |       |       |       |
| Rapid transit   | 272   | 459   | 575   |
| Street railways | 478   | 852   | 979   |
| Omnibuses       | 291   | 689   | 1,658 |
| Total           | 1,041 | 2,000 | 3,212 |
| Population      | 6,858 | 7,341 | 7,65  |
| Rides, per head | 152   | 272   | 420   |
| NEW YORK        |       |       |       |
| Rapid transit   | 453   | 896   | 1,801 |
| Street railways | 683   | 919   | 1,057 |
| Omnibuses       | 1     | 14    | 146   |
| Total           | 1,137 | 1,829 | 3,004 |
| Population      | 4,285 | 5,047 | 5,873 |
| Rides, per head | 265   | 362   | 511   |

While the total travel in the two cities has remained for 20 years substantially the same, the rides *per capita* in New York are greatly in excess of those in London, and the distribution among the several types is radically different.

**London and New York.**—In London all types of transportation show for each decade a substantial growth, but the greatest increase is in passengers carried by the omnibuses, whose traffic was more than doubled in the first 10 years and again doubled in the next 10. Thus is short-distance travel cared for with the minimum of operating and capital cost since a free right-of-way is provided in the public streets and no construction other than the vehicles is involved. In New York the greatest demand is for a rapid transit service, the burden of which doubled and redoubled during the past two periods of 10 years. The construction cost for the necessary long-distance high-speed facilities mount up to \$10,000,000 per mile of four tracks exclusive of equipment. In both cities the rate of increase in the street railways is less in the second period than in the first, due largely to the fact that there has been no increase in new facilities of this type, but in New York there is shown a very rapid growth in omnibus service in connection with which new routes have been established and additional vehicles put in commission particularly since 1915. The differences illustrate the greater intensity of the American problem.

**Some American Cities.**—To extend the comparison the following figures give the corresponding data for three other American cities each typical of a distinct class: Philadelphia, one of the oldest American cities with a steady growth in population,

served by all forms of urban transportation; Chicago, which in 100 years has risen from an insignificant hamlet to the second city in size in the United States and which has been equipped with rapid transit railways for some years; and Detroit, an exhibit of phenomenal development in the past 20 years but which is still dependent for its local transportation on surface means. The figures are given in millions.

| Type             | 1905 | 1915 | 1925  |
|------------------|------|------|-------|
| PHILADELPHIA     |      |      |       |
| Rapid transit    |      | 42   | 89    |
| Surface railways | 382  | 474  | 585   |
| Omnibuses        |      |      | 11    |
| Total            | 382  | 516  | 685   |
| Population       | 1.4  | 1.7  | 2     |
| Rides, per head  | 273  | 303  | 346   |
| CHICAGO          |      |      |       |
| Rapid transit    | 124  | 165  | 217   |
| Surface railways | 350  | 623  | 842   |
| Omnibuses        |      |      | 58    |
| Total            | 474  | 788  | 1,117 |
| Population       | 1.9  | 2.4  | 3     |
| Rides, per head  | 240  | 323  | 369   |
| DETROIT          |      |      |       |
| Surface railways | 88   | 240  | 358   |
| Omnibuses        |      |      | 43    |
| Total            | 88   | 240  | 401   |
| Population       | 0.3  | 0.6  | 1.2   |
| Rides, per head  | 231  | 400  | 323   |

The striking features of these statistics, which are fairly representative of American cities, are that the growth in rides is greater than the growth in population except in Detroit where population is advancing by great strides and faster than new transportation facilities have been provided, and that the relative increase in rides is greater according as the cities are greater—in short there is a cumulative result that produces the serious aspect of the new problem.

Taking the four cities in question, while the combined population in 1925 was 150% of what it was in 1905, the rides were 250%. If the ratio of growth be squared it will be seen that the increase in rides in 20 years was 1.11 times that of the square of the growth in population. In other words, if a city be doubled in number of inhabitants the burden of urban transportation will be increased fourfold. Taking the individual cases it will be seen that the ratio of rides to population increases with the size of the city. Thus the ratio between the increase of rides and the square of the increase of population is for Detroit 0.44; Philadelphia 0.9; Chicago 1.0; New York 1.4.

Another complication in urban transportation is the use of the motor-car, the expansion of which still further congests the streets and tends to prevent increasing surface transportation facilities by surface railways or omnibuses. This is particularly in evidence in America where on account of the low cost of certain cars they are freely used by all classes. The local registration in the two largest cities for 10 years was as follows:—

| Type       | 1915   | 1920    | 1925    |
|------------|--------|---------|---------|
| NEW YORK   |        |         |         |
| Passenger  | 59,850 | 152,036 | 365,894 |
| Commercial | 12,148 | 83,746  | 114,022 |
| CHICAGO    |        |         |         |
| Passenger  | 36,419 | 86,709  | 290,956 |
| Commercial | 7,384  | 22,900  | 48,262  |

These figures, without parallel in other countries, are repeated proportionally in other American cities. In the United States there is one car for every six persons, while in Great Britain there is (1926) 1 for 57, in France 1 for 69 and in Germany 1 for 272. (See MOTOR VEHICLES.) (W.B.P.)

**UROLOGY** (see 27.797).—Recent progress in urology has been due largely to improvements in the cystoscope, advances in radiology, use of diathermy and close co-operation between urologists, bacteriologists, and bio-chemists. Endo-vesical instruments are now available from the simplest cystoscope, consisting of a telescope within an irrigating sheath, to complicated instruments with which lesions can be treated surgically under direct vision instead of by an open operation.

Similarly, advances in radiology have led to the detection of calculi hitherto regarded as transparent to the rays, and to stereoscopic radiograms indispensable for locating a suspicious shadow in the neighbourhood of the kidney or ureter. Pyelography also gives information concerning the size and shape of the renal pelvis and calices. A skiagram is taken after a fluid opaque to the X-rays (e.g., sodium iodide or lipiodol) has been introduced into the renal pelvis by means of a ureteric catheter. It is of great value in diagnosing early dilation of the kidney, silent hydronephrosis, polycystic kidney, malformation of the pelvis and renal tumours encroaching on the pelvis; in localising shadows in the renal area such as calcified mesenteric glands and gall stones, and in differentiating between abdominal and renal tumours. By similar means, silhouettes of the bladder or male urethra can be obtained, though in the latter instance they are not indispensable, for the canal can be examined easily and thoroughly with a urethroscope.

Perirenal inflation with CO<sub>2</sub> was introduced by Carelli of Buenos Aires and in radiographs shows clearly alterations in shape, size and density, therefore being useful in such conditions as early hydronephrosis, polycystic kidneys, tuberculosis, tumours and stones not dense enough to show by ordinary radiography; but its greatest value lies in giving a clear and distinct radiogram of the suprarenal capsule.

**Diathermy.**—Diathermy (see ELECTRO-THERAPY) acts by virtue of the heat generated in the tissues by the resistance they offer to the passage of an electric current. For this purpose a very strong current must be used, deprived of its stimulating and electrolytic properties by alternations of not less than 500,000 per second.

The only sensation produced by a current of such high frequency is one of heat ranging, according to the strength of the current, from a pleasing warmth to a temperature high enough to char the tissues for a distance of about 1 cm. from the electrode. All degrees of diathermy are used for diseases of the genito-urinary system, the lower temperatures for testicular neuralgia and epididymo-orchitis, chronic urethritis and prostatitis, and benign enlargement of the prostate when a radical operation is inadvisable. Destructive diathermy is now the method of choice in the treatment of certain forms of papilloma of the bladder and urethra, and in the median bar type of prostatic obstruction. It has also been employed with moderate success for carcinoma of the prostate.

**Use of Radium.**—Radium (*q.v.*) has been used extensively for carcinoma of the prostate and bladder. It is applied in the form of needles and emanation tubes or seeds implanted directly into the growth, but has not yet emerged from the experimental stage. Caution is required in its use, for large doses produce great irritation and may be followed by excessive infiltrations of the bladder neck. Again, emanation tubes placed too close to the pouch of Douglas have caused peritonitis and death. In view of these disadvantages and the discouraging results they have encountered many urologists are now averse to using it at all.

**Urinary Antiseptics.**—Both mercurochrome and hexyl-resorcinol are powerful antiseptics, and though not "ideal" are valuable additions to the comparatively few powerful bactericides which can be administered with safety. Mercurochrome can be used either locally or intravenously. In cases of chronic cystitis, usually due to the colon bacillus, instillation of a watery solution (0.2-1.0%) sometimes has a remarkable effect. In pyogenic coccal infections the results are not so striking. In pyelitis, irrigation with mercurochrome is not so irritating as with silver nitrate. Instillations appear to be particularly

valuable for chronic posterior urethritis, especially when complicated by prostatitis and vesiculitis. When given intravenously in doses of from 1 to 5 mg. per kg. of body weight results have been most encouraging, especially in acute coccal and bacillary infections of the genito-urinary tract associated with pyrexia. Chronic afebrile colon bacilluria, on the other hand, does not always respond so readily to this treatment. In rare cases, pronounced febrile and gastro-intestinal reactions follow the injection but these usually subside in 24 hours. The danger to the kidneys of such a powerful mercurial compound must never be overlooked, but Young (Baltimore) considers it may be used intravenously without fear of injury.

Hexyl-resorcinol [C<sub>6</sub>H<sub>5</sub>(OH)<sub>2</sub>C<sub>6</sub>H<sub>13</sub>] is a synthetic compound first described by Leonard. Possessing forty-five times the germicidal power of phenol, it conforms experimentally to the qualifications necessary for an ideal urinary antiseptic in that it is chemically stable, non-toxic, non-irritating to the urinary tract, has an antiseptic and bactericidal action in high dilution in urine of any reaction, and is eliminated in high percentage by the kidneys. On the other hand, it can only exert its germicidal properties on tissues with which the urine comes in contact, and therefore infections of the renal parenchyma and submucous tissues of the urinary tract are not affected by it. If taken on an empty stomach the drug may cause griping or catharsis. Infections due to pyogenic cocci appear to yield to the drug with remarkable rapidity. *B. coli* infections of the urinary mucosa with a low bacterial count can be cured with hexyl-resorcinol, but when the count is high and the sub-mucous tissues are infected, prolonged treatment combined with appropriate local treatment is necessary. When administered prophylactically two days before, and daily after operations on the bladder, the wounds remain healthy and healing is accelerated.

**Tests of Renal Function.**—Tests for estimating the function of one or both kidneys are now employed regularly. Though not conclusive, they are capable of giving a warning which should be heeded, particularly in operations on the urinary tract. Thus in prostatectomy they serve to determine a one- or two-stage operation, and since they have been adopted as a routine the mortality from uraemia has become almost negligible. The chief tests in use in England are: (1) The urea concentration test (Maclean and de Wesselow); (2) estimation of blood urea; (3) colour tests. The technique of applying these tests can be found in appropriate text-books.

The range of normality of the blood urea is so great that this test alone is of little value unless the urea retention is above 50 mg. per 100 cu.cm. of blood, but when combined with the urea concentration test it gives an excellent indication of the renal efficiency. In some clinics on the Continent great reliance is placed on the elimination of creatinin and chlorides as tests of renal efficiency. The dyes chiefly employed for colour tests are indigo-carmin and phenolsulphonaphthalein. Indigo-carmin can be employed during a cystoscopy and gives a good indication of the function of one kidney without the use of a ureteric catheter (chromocystoscopy). A 0.4% solution injected either intravenously (5 c.c.) or intramuscularly (20 c.c.) should tinge the urine of a healthy kidney in five minutes. Phenolsulphonaphthalein is excreted solely by the kidneys and so differs from indigo-carmin, which is only partly excreted by the kidneys. In America it is used almost exclusively, but in England it has not been popular owing to the somewhat elaborate technique required and to the difficulty, since the War, of obtaining a reliable preparation of the dye. The test is very reliable provided the pure compound is used.

The capacity or otherwise of a patient to resist the spread of sepsis to the upper urinary tract after an operation, such as prostatectomy, is a factor which may upset the calculations of both surgeon and bio-chemist. MacAdam and Shiskin have found that the cholesterol content of the blood gives a fair indication of the power of resistance. The average in a series of healthy adults under 50 years of age was found to be 0.16%. Above 50 years it ranges between 0.13% and 0.19%. Practical experience led these workers to conclude that in prostatic

obstruction a blood-cholesterol below 0.13% indicates such a lowered resistance to the spread of sepsis as to constitute a bad operative risk. Cases with a high blood-urea and a normal blood-cholesterol all recovered from a two-stage prostatectomy, but out of eight cases with a high blood-urea and a low blood-cholesterol all died save one.

**The Kidney.**—Dudgeon and others have pointed out the combination of pus cells and a pure culture of staphylococcus albus in the urine of one kidney is almost pathognomonic of a stone in that kidney. With certain reservations all cases of renal calculus are now subjected to operation, for the stone, whether causing symptoms or not, slowly but surely injures the kidney and often determines a serious bacterial infection. Small stones are more dangerous than large ones, for they may lodge in the ureter and cause hydronephrosis, anuria and so on.

The problem of bilateral lithiasis is a difficult one, but on the whole urologists advocate operation on the healthiest kidney first, as there is always the possibility that nephrectomy may be necessary on the side which is more grossly affected. Pyelolithotomy is now performed in preference to nephrolithotomy whenever possible.

Decapsulation of the kidney for nephritis has been performed on many occasions with varying success, but is viewed with increasing favour. The benefit obtained is probably due to the mechanical relief of renal tension, and this certainly explains the immediate improvement following unilateral decapsulation in eclamptic uraemia. The indications for this operation are uraemia, anuria, oedema, excessive albuminuria and obstinate haematuria. Contra-indications are age, heart diseases and extensive cardiovascular changes.

**Renal Tuberculosis.**—Investigations by Braasch in the Mayo clinic have disproved the common opinion that renal tuberculosis is usually primarily unilateral. In seven out of 22 apparently unilateral cases, the urine from the supposed healthy kidney was proved to contain tubercle bacilli by animal inoculation, a fact which goes far to explain the comparatively heavy mortality in the first few years after nephrectomy. Continental writers estimate that in life the infection is bilateral in about 15% of cases, whereas in the post-mortem room it is as high as 65%. This fully bears out the experience that spontaneous cure is extremely rare and that the only rational treatment of unilateral tuberculosis is early nephrectomy. In bilateral infections, Ekehorn advocates and practises removal of that kidney which is found by inspection to be the most diseased, or which is thought to be the cause of pyrexia and distressing bladder symptoms. In 20 cases reported by him the results were good enough to justify the operation. The treatment of the tuberculous ureter is still under discussion, most workers considering that it heals naturally after the diseased kidney has been removed, while others advocate a primary nephro-ureterectomy to prevent infection of the lower urinary tract by the diseased ureter. All are now in favour of a post-operative course of tuberculin.

**Movable Kidney.**—Operations for nephroptosis are decreasing in number year by year, for surgeons have now realised that the condition is commonly associated with Glenard's disease and with such general symptoms as headache, gastric discomfort, neurasthenia and ptoses of various kinds, for which fixation of the kidney gives no relief whatever. Nephropexy is now reserved chiefly for cases of intermittent hydronephrosis, haematuria, casts and albuminurias, and for uncomplicated renal pain relieved absolutely by rest in the horizontal position.

**Ureteral Calculus.**—In the case of small stones impacted in the ureter most urologists favour removal by manipulative and other methods rather than by ureterolithotomy. The chief methods employed are: (i.) dilation of the ureter combined with instillation of sterile liquid paraffin, subcutaneous injection of atropine, and forced diuresis with Contrexéville water; (ii.) intra-ureteral instillation of 5 cu.cm. of a 2% solution of papaverine sulphate, selected for its analgesic and antispasmodic properties; (iii.) dilation of the ureter by diathermy, and (iv.) division of the ureteric meatus with scissors through a cystoscope.

Severe reactions after cystoscopic manipulations, and irregular stones greater than 1 cm. in diameter are indications for uretero-lithotomy. The pelvic portion of the ureter is now always exposed extraperitoneally, either through a paramedian subumbilical incision or by Kidd's inguinal operation.

**Transplantation of the Ureter.**—The ureter may be implanted into another part of the bladder, either for stricture of its extramural portion or after partial cystectomy for growths involving the ureteric orifice. For inoperable bladder growths and for extrophy of the bladder, Coffey has devised a method of simultaneous transplantation of both ureters into the pelvic colon, which does not obstruct the ureters or disturb kidney function.

**Bladder.**—The bacteriology of cystitis and pyelocystitis has received much attention from bacteriologists. The most important recent communications on this subject are by Dudgeon, Wordley and Bawtree. These workers have isolated from different cases:—

- (1) A special group of haemolytic bacilli, strongly resembling but not identical with the paratyphoid bacillus; (2) the colon bacillus; (3) Proteus.

**Vesical Diverticula.**—Improvements in the cystoscope have led to earlier recognition of diverticula. Swift Joly reviews the whole subject and discusses the relative value of the different operations. He also points out that accompanying prostatic or urethral obstruction should be treated at the same time whenever possible.

**Papilloma.**—These tumours are now treated by fulguration through a cystoscope whenever possible, and in many instances can be destroyed completely at one sitting and under local anaesthesia. When the papilloma is sessile and diathermy can only be applied to the surface nearest the cystoscope, several treatments at intervals of a week or ten days may be required, a portion of the growth being destroyed at each sitting. Subsequently a cystoscopic examination should be made at intervals of three to six months for at least three years, so that fresh growths can be kept in check. Open operation by the suprapubic route is reserved for large growths, especially if sessile and for those involving the ureteric orifice. In some cases the tumour can be destroyed by diathermy with a large electrode, in others a partial cystectomy; with or without transplantation of the ureter, is necessary. Attention has been called to the danger of "graft-recurrences" in the abdominal wall after removal of papillomata by the suprapubic route, and Maybury and Dyke have reported a case in which three successive implants grew in the abdominal wall. The primary vesical growth was benign but the recurrent implants became progressively malignant. Carcinoma should be excised whenever possible, for as yet the results of treatment with imbedded radium is disappointing and uncertain. In the flat ulcerating form of carcinoma, peculiar to the aged, a fair measure of comfort and relief can be obtained from deep X-ray therapy.

**The Prostate.**—For chronic inflammatory lesions of the prostate and seminal vesicles diathermy is valuable and acts, not only on the gland itself, but also on the arthritic and other complications so frequently associated with gonorrheal prostatitis and vesiculitis. In cases of enlarged prostate where operation is impossible owing to age, cardiovascular changes, advanced renal disease, etc., a fair measure of relief can be obtained by medical diathermy or by deep X-ray therapy. In all other cases prostatectomy is undoubtedly the correct procedure. The type of enlargement most suitable for operation is that due to chronic lobular prostatitis with pronounced adenomata; the second type, chronic interstitial prostatitis or fibrous prostate, presents many difficulties to the operator but should be removed whenever possible, as it causes a severer degree of obstruction and consequent impairment of the renal function than the adenomatous variety. Before deciding on an operation the chemical tests of renal efficiency should be carried out, for the type of operation selected will depend almost entirely on these tests. Careful preliminary treatment, often lasting several weeks, is nearly as important as the operation itself.

After much discussion, the majority of urologists have decided in favour of the suprapubic operation in one or two stages. The two-stage operation has reduced the mortality from uraemia to a negligible quantity and is indicated in all cases with renal deficiency, severe cystitis, retention, or four or more ounces of residual urine. The Thomson-Walker operation is undoubtedly an improvement on the somewhat crude but remarkably effective operation practised by Frey. It takes longer but eliminates the risk of post-operative stricture. The perineal operation, performed almost exclusively by Young of Baltimore, is in England reserved for carcinoma and for the fibrous type of prostate. Here the advantages of control of haemorrhage and perfect drainage are outweighed by the dangers of pelvic cellulitis, perineal fistula and incontinence of urine.

**Prostatic Bars.**—In about 25% of patients with symptoms of prostatic obstruction but without palpable enlargement of the prostate, a careful cystoscopic examination reveals the presence of a ridge of hypertrophied tissue, either on the posterior lip of the prostate overhanging the internal meatus, or projecting upwards from the floor of the prostatic urethra and constituting the so-called median bar. For the relief of this type of obstruction H. Young invented his well-known punch, later improved by Kenneth Walker, by adapting it for diathermy. (See ELECTROTHERAPY.)

**Carcinoma.**—Hitherto, treatment of prostatic carcinoma by radium has been so unsatisfactory that many surgeons have ceased to use it. Diathermy has been more or less successful in conferring relief, but the results can hardly be described as brilliant. Whenever possible, Young's perineal resection appears to be the most satisfactory procedure; failing this, excellent results have been sometimes obtained from deep X-ray therapy.

**The Testis.**—Steinach of Vienna performed vasoligation in senile rats with a view to increasing the internal secretion of their testes and thereby stimulating their failing energies. For two to four weeks after bilateral division of the vas between ligatures no appreciable change was noticeable. The rats then began to show a return of sexual excitement and vigour, in some instances equalling that of young males. This was followed in rapid succession by a return of pugnacity, increase in muscular energy and a copious growth of fur. The change lasted for about six months, when the animal gradually lost his youthful appearance and powers and became senile again, eventually dying within a few weeks of the onset of the change. Steinach found that the operation induced degeneration of the seminal epithelium (later followed by regeneration) and an increase in the interstitial tissue. In man the operation has been attended by very variable results. The greatest successes appear to have occurred in cases of premature old age; when performed for impotence alone it is not so satisfactory, and is quite useless if the testis be already atrophied. Some cases of arteriosclerosis have been greatly benefited by it.

**Testicular Grafts (see REJUVENATION).**—Grafts from lower animals have been employed for many years with more or less similar results, viz., improvement shortly after implantation, followed by atrophy and absorption of the graft, and a return on the part of the patient to the original condition. Voronoff in 1920 used testes of anthropoid apes and found that they survived for three years or longer, and that the initial improvement in the patient's condition was maintained. Kenneth Walker has on several occasions employed a healthy human ectopic testis. He concludes that the life of a hetero-graft is not longer than two years, that absorption of the graft does not necessarily imply a return of the patient to his former condition, and that permanent improvement is probably due to increased growth in other endocrine tissues stimulated into activity by the graft.

**Tuberculous Epididymitis.**—When this disease is advanced castration is indicated, but when it is localised to the globus major or minor epididymectomy is now regarded as the correct procedure. The full extent of the disease must always be determined with care.

**The Urethra.**—The great improvement in urethrosopes has simplified the diagnosis and treatment of urethral conditions. With the Joly type of posterior urethroscope, diathermy can be applied where formerly a serious cutting operation was necessary. There is now an increasing tendency to revert to former methods and to treat stricture of the urethra by gradual dilatation with metal sounds or gum elastic bougies, urethrotomy being reserved for resilient and cartilaginous strictures and those complicated by fistulae. If contraction recurs after internal urethrotomy many surgeons advocate excision of the stricture and axial anastomosis. When a large amount of cicatricial tissue has been excised, the gap has been successfully bridged in one case by implantation of the patient's appendix, and in another by a child's prepuce fashioned into a canal around a catheter.

**URUGUAY** (see 27.805).—The smallest of the South American republics, has an area of 72,180 square miles. Uruguay broke off diplomatic relations with Germany in Oct. 1917 after a Government decree had been published defining the country's attitude towards the American powers which had preceded it into the War. The estimated population on Dec. 31 1925 was 1,758,334, an increase of 68.6% since the last census in 1908. The population of Montevideo, the capital, on June 30 1925, according to the Municipal Statistical office, was 381,228. Cities with a population of 30,000 or more were Paysandú, Salto and Mercedes. The average density of population increased from 12.9 per sq. m. in 1908 to 24.4 in 1925, the latter being greater than that of any other South American country.

## I. POLITICAL HISTORY

The administration of President Claudio Willman (1907-11) marked a definite period of progress and stabilisation. Since no serious armed attempt was made to overthrow the Government its efforts were largely concentrated on educational progress and internal development. The first child-labour legislation was adopted, the death penalty abolished, and a model penitentiary and a tuberculosis sanatorium were established.

The social and educational progress of the country continued during the second administration of José Batlle y Ordóñez (1911-5), who succeeded Willman. Hours of labour were regulated, a National Insurance Bank was established and experts were brought from the United States and Europe to advance education, particularly industrial and agricultural. The first South American International Conference of Agricultural Defence was held at Montevideo on May 2 1913, and 200,000 gold pesos (1 peso=\$1.03) annually was appropriated for free seeds for farmers. A law of July 12 1911 set aside 100,000 pesos for the encouragement of immigration.

In May 1910, ratifications of the boundary treaty concluded in Oct. 1909 were exchanged between Uruguay and Brazil; this settled several minor but long-pending questions. A subsequent treaty of May 7 1913, since carried out, provided for delimiting and marking the boundary. Brazil ceded to Uruguay "the waters and navigation" of Lake Mirim and the Jaguarão river, and the contracting parties agreed not to fortify their new frontiers. Uruguay continued to prosper under her next President, Feliciano Vieira (1915-9), who surrounded himself with able advisers of the young and progressive group which continued to dominate

Uruguayan affairs. Most of them had studied or travelled abroad. Baltasar Brum, Vieira's successor in the presidency, had been Minister of Foreign Affairs in the latter part of Vieira's administration, when the growing pro-Ally sympathies of Uruguay were crystallised by the entry of the United States into the World War. Although no military or naval aid was sent to the Allies, Uruguay's sympathies continued with them until the end of the War. On Nov. 9 1917, the eight German merchant vessels in Montevideo harbour were seized by the Uruguayan Government. A credit of 15,000,000 pesos (approximately £3,000,000 at normal exchange) was advanced to England by the Uruguayan Govt. at 5%, to be used for the purchase of supplies in Uruguay.

In 1916 a constitutional convention met to discuss a new constitution to replace that of 1830. The convention concluded its task in Oct. 1917, and the new constitution came into effect on March 1 1919. The most important change in it was the definite separation of Church and State. The Roman Catholic Church, though no longer recognised as the state religion, was given control of those places of worship wholly or partly constructed by funds from the national treasury. Members of the clergy were eligible for election as representatives or senators. Decentralisation of the formerly strongly centralised Federal Govt. was brought about by the installation of popularly elected assemblies and autonomous councils of administration to regulate the local affairs of the departments, with control over the municipalities. The chief of police in each department, paid by the national treasury, was made subordinate to, and appointed or dismissed by the President of the Republic. The executive power was divided between the President (elected by the direct vote for four years) and an administrative board composed of nine members elected by a popular vote for a six-year term, one-third of its members retiring every two years. The President was to co-operate with this board, which directs the affairs of the departments of Finance, Public Instruction and Public Works, the President controlling those of the Interior, Foreign Relations, War and Marine. Minority representation was protected by a system of plural voting, and woman suffrage provided for, subject to acceptance by a two-thirds majority of each chamber of the legislature. The General Assembly, composed of two Houses, was charged with the interpretation of the constitution and the election of justices of the Supreme Court. Uruguay spends more money on education than on her combined army and navy under this new and liberal constitution.

Uruguay's youngest President, Baltasar Brum, took office on March 1 1919, and surrounded himself with an able and progressive Cabinet. Uruguay ratified the Treaty of Versailles in 1919, and also concluded obligatory arbitration treaties with Great Britain and Italy in that year. A system of old-age pensions was introduced in 1919, and a total of 20,000 pensions had been granted by 1925. José Serrato, an engineer of Italian descent, became President on March 1 1923. In 1922 Uruguay became a non-permanent member of the Council of the League of Nations.

**Education.**—Primary education is compulsory. In 1923 there were 1,045 Government schools with 120,583 children in attendance. Private schools in 1922 were 186 with 20,168 pupils. Evening courses for adults were attended by 6,678. The Agronomical Institute of the University of Montevideo, which was opened in Sept. 1906, was developed into a National Agricultural College, modelled on the best European and United States institutions. Vocational training was given gratuitously to 185 pupils in the school of arts and trades supported by the Government. The University of Montevideo had a student body of 1,615 in 1922.

## II. FINANCIAL AND ECONOMIC HISTORY

The public debt of Uruguay was 129,774,119 pesos in 1900 and 176,603,631 pesos in 1924, a small relative increase. The budget estimates for 1924-5 were, revenue 45,182,207 pesos and expenditure 45,120,052 pesos. It was decided to prolong the budget of 1924-5 for the whole of the period 1925-6, with the estimated expenditure altered to 47,199,900 pesos. Revenue for 1923-4 was 44,963,678 pesos and expenditure 43,033,998 pesos. Customs receipts in 1924 were 14,573,890 pesos.

**Production and Trade.**—Agricultural development has favoured the increase of small holdings and of peasant proprietors. The number of rural holdings in 1908 was 48,874, in 1916 there were 57,974. The cattle census of 1924 gave the number of meat cattle as 8,431,613, as against 7,802,442 in 1916. The wool-clip 1923-4 yielded 49,500,000 kilos of wool, the number of sheep being estimated at 14,443,341. The meat-packing industry has developed rapidly, and in 1912 a large and up-to-date packing and freezing plant was established at Montevideo. In 1920 Uruguay had two freezing plants, 13 salting plants, three canning and three tongue-preserving factories, as well as a large factory for liquid meat extract.

Extensive manganese deposits were discovered in 1924. The accompanying table, given in thousands of gold pesos, contains the latest available statistics of foreign commerce:—

| Countries             | Imports |        | Exports |        |
|-----------------------|---------|--------|---------|--------|
|                       | 1924    | 1923   | 1924    | 1923   |
| Great Britain . . . . | 11,398  | 11,592 | 24,253  | 25,536 |
| United States . . . . | 14,917  | 10,340 | 7,103   | 14,911 |
| Germany . . . . .     | 6,613   | 5,166  | 17,731  | 12,530 |
| Argentina . . . . .   | 6,211   | 5,460  | 11,384  | 6,007  |
| France . . . . .      | 3,516   | 2,378  | 13,791  | 10,429 |
| Brazil . . . . .      | 5,295   | 4,927  | 6,135   | 1,802  |

**Communications.**—Through rail communication between Montevideo and Rio de Janeiro was completed in 1911 by the connection of various railways in Southern Brazil. Work has been expedited on the San Carlos-Rocha line, and it is proposed to construct a direct line from Montevideo to the free port of Colonia. In 1921 there were 1,625 m. of railway open for traffic in Uruguay.

Acevedo, *Manual de Historia Uruguaya* (Montevideo, 1916, etc.); H. J. Gordon Ross, *Argentina and Uruguay* (London, 1917); W. Parker, *Uruguayans of To-Day; in Hispanic Notes and Monographs*, vol. 6, 2nd ed. (New York, 1921); Department of Overseas Trade, *Reports* (London, 1922, etc.). (C. L. C.)

**UTAH** (see 27.813), a State of the United States. Owing to increase in industry in the years 1910-25, the urban population of Utah increased more rapidly than the rural. The population in 1925 was estimated at 485,530, as compared with 449,396 in 1920.

**Political History.**—Political divisions are no longer on religious lines. Utah was Republican between 1910 and 1925 except in 1916, when both the electoral vote and state officers were Democratic; and in 1924, when the national and state officers elected were Republican, but the governor was a Democrat. The governors from 1909 to 1925 were William Spry (Rep.), 1909-17; Simon Bamberger (Dem.), 1917-21; Charles R. Mabey (Rep.), 1921-5; George Dern (Dem.), 1925-.

Section 3 of article 10 was amended, Nov. 8 1910, to provide that funds from the state tax for high schools be apportioned among cities and school districts according to attendance at high schools. Section 4 of article 13 was amended to provide that after Jan. 1 1919 metalliferous mines and mining claims be assessed at \$5 per ac., and in addition thereto at a value based on some multiple or sub-multiple of net annual proceeds. All other mineral deposits, including coal, are assessed at full value, as are also machinery and surface improvements. Article 22 was amended to prohibit, after Jan. 1 1919, the manufacture and sale of intoxicating liquor containing in excess of one-half of 1% of alcohol.

**Education.**—The state tax furnishes approximately \$25 per annum for each child of school age. The total expenditure for elementary and high schools in 1923-4 was \$9,882,768.47, making \$71.79 for each child of school age. In 1925 there were 139,457 children of school age in the state, 93% of whom were enrolled in public schools. Of this number, 23,379 were enrolled in the high schools. Attendance at high school in 1924 was double the attendance in 1918.

**Irrigation.**—An important irrigation enterprise, the Strawberry project, begun in 1906, has been completed. By means of a tunnel 4 m. long through the Wasatch mountains, water is brought from a drainage basin on the east side of the mountains into the Utah valley, 45 m. away. The reservoir in Strawberry valley, covering 8,100 ac., 7,600 ft. above sea-level, has a capacity of 280,000 ac. ft., of which only 75,000 are to be used annually until the project is enlarged. The state's irrigated acreage in 1919 was 722,772; in 1924, 1,371,651. The Great Salt Lake Basin project, under construction in 1925, is designed to double the irrigated area in the northern valleys of the state.

**Agriculture.**—Important acts in the interests of agriculture were passed by the legislature of 1921. Several separate boards and commissions were consolidated and placed in a department of agriculture composed of seven members with an executive officer, called the commissioner of agriculture. In 1920 there were 25,622 farms, with an acreage of 5,050,410, of which 1,716,380 ac. were improved land. The chief products in 1924 were:—

|              | Quantity       | Value        |
|--------------|----------------|--------------|
| Wheat        | 4,413,000 bu.  | \$ 5,737,000 |
| Corn         | 728,000 bu.    | 1,056,000    |
| Oats         | 3,080,000 bu.  | 2,156,000    |
| Barley       | 936,000 bu.    | 807,000      |
| Rye          | 99,000 bu.     | 106,000      |
| Hay          | 1,631,000 tons | 19,246,000   |
| Alfalfa seed | 350,000 bu.    | 3,430,000    |
| Potatoes     | 2,184,000 bu.  | 1,616,000    |
| Sugar beets  | 568,000 tons   | 4,703,000    |

Livestock on Jan. 1 1925 were estimated at 2,246,000 sheep, 385,000 beef cattle, 101,000 dairy cows, 97,000 swine and 122,000 horses and mules. The wool clip in 1925 was estimated at 16,000,000 lb.

**Minerals.**—During the period 1910-25 the development of all the mineral resources of Utah proceeded rapidly. There are 13,130 sq. m. of workable coal land in the state. At the end of 1923 approximately 80,000,000 tons had been mined. It was estimated in 1925 that only .05 of 1% of the total available supply had been taken out. In 1924 Utah was the leading metal mining state. Mining supplies 85% of the freight traffic originating within the state. The mines, mills and smelting afford employment to over 18,000 men, and the wages bill is about \$30,000,000. The chief mineral products in 1924 were: Silver 17,000,000 oz., copper 242,700,000 lb., lead 241,425,000 lb.

**Industries.**—The chief industries of the state in 1920 were meat-packing, creameries and condenseries, canneries, flour and cereals, candy, salt, metal and sheet iron, cement and lime. By 1925 there had been important additions, including two large establishments manufacturing radio sets and appliances; a concern manufacturing car wheels; and two iron and steel industries; \$4,000,000 of capital was added to the flour-mill business. In 1924 the manufacture of pig iron had been undertaken by the Columbia Iron and Steel Corporation, with a capital of \$20,000,000. This corporation has coal mines at Columbia, Utah, iron mines at Iron Springs and blast furnaces at Ironton, about 30 m. from Salt Lake City. The blast furnaces are capable of producing 400 tons of pig iron per day, which requires 800 tons of iron ore and 400 tons of coke, and to make the necessary coke 800 tons of coal are required, the daily output from the coke ovens being 11,000,000 cu. ft. of gas, 100,000 gal. of coal tar, 2,000 gal. of benzol and 18 tons of ammonium sulphate. The number of employees reported in the classified industries by the industrial commission was 58,464 in 1925. The railway and highway systems radiate from Salt Lake City. The total length of main line railway was 2,207 m. in 1923, and a network of excellent highways connect the principal towns with the capital. (G. E. F.)

**UTICA, N.Y., U.S.A.** (*see* 27.820), increased 26.5% in population in the decade after 1910, reaching 94,156 in 1920, of whom 23,291 were foreign-born; and 101,604 in 1925, according to the state census (local estimate, 110,000). The area was more than doubled, increasing from 9.2 sq. m. in 1910 to about 24 in 1924. The varied products manufactured within the widening city limits were valued at \$31,199,000 in 1909; \$77,746,000 in 1919; \$76,060,528 in 1923. Utica is served by the New York State Barge canal, opened in 1918. The abandoned bed of the Erie canal was utilised for a water conduit, and a roadway was built over it (1921). Hydroelectric power, generated at Trenton Falls, is available, and the proposed super-power development for the eastern states contemplates Utica as one of the load centres and distributing points. By 1925 zoning ordinances had been adopted; a soldiers' and sailors' memorial hospital had been added to the buildings of the state Masonic Home; and the park system had been expanded until it contained about 700 acres.

**UZBEGISTAN.**—A Soviet republic in Central Asia. It comprises districts formerly known as Bokhara and Ferghana and also including a part of former Turkestan. (*See* TURKESTAN.)

**VACCINE THERAPY.**—This consists in the introduction into the body of a suitable vaccine, in order to stimulate the tissue cells to elaborate a sufficiency of specific antibodies to resist the subsequent invasion of a particular micro-organism; or in the case of an already infected individual to prevent the further multiplication and diffusion of the invading bacterium—in other words, to establish a condition of active immunity.

To Edward Jenner belongs the credit of exploiting the use of an attenuated virus for the production of an active immunity to smallpox, and originally the term "vaccine" was restricted to the virus of smallpox as altered by its passage through the bovine species, in which it gives rise to cow-pox or vaccinia. Pasteur then applied the principle to the prophylaxis of bacterial infections and Almroth Wright expanded it to embrace not only the prevention but also the treatment of microbial disease. Consequently, the word "vaccine" now includes suspensions of bacterial cells and emulsions of bacterial protoplasm, which when introduced into the human economy result in the formation of specific antibodies.

In either case the plan adopted was to inject successive quantities of bacterial protoplasm derived from artificial cultures of the particular micro-organism under study. In the initial stages of the process these cultures are usually modified by some physical agent, such as heat, in order to attenuate or destroy the virulence of the microbe. For instance, Pasteur vaccinated sheep with cultures of the anthrax bacillus which had been attenuated by growth at a temperature ( $41^{\circ}\text{C}$ ) some degrees above the optimum, to protect them against the natural disease splenic fever; and Wright used cultures of *B. typhosus*, killed by heating to  $60^{\circ}\text{C}$ . for the protection of British soldiers in India against typhoid fever.

The success that attended this work of Wright, sufficiently notable in the later stages of the Boer War, reached its culmination during the World War, when first typhoid, and subsequently paratyphoid, fevers were eliminated from the British Army by the use of appropriate vaccines, and in consequence prophylactic vaccination against these diseases has established its position in preventive medicine.

Attempts have naturally been made in the direction of prophylaxis against many other infective diseases by the use of special vaccines, as, for example, cholera; plague; dysentery; cerebro-spinal fever; tuberculosis; pneumonia; influenza and the common "cold"; but although considerable success has been attained, the results have not presented the uniformity of those achieved in the prevention of typhoid and para-typhoid fever. At the same time, it must be conceded that it is a difficult matter to arrange "mass" experiments in which the numbers of inoculated and uninoculated or "control" individuals are sufficiently large to permit of the application of statistical methods in the evaluation of the results obtained, particularly in view of the very brief "incubation" period of many of these diseases. This difficulty becomes even greater when vaccines are employed in the treatment of individuals already incapacitated by bacterial infections, for here each case must be judged as a separate entity and accessory means of treatment, to say nothing of the long arm of coincidence, are factors which cannot be ignored when attempting to form a just estimate of the value of vaccine therapy. In the opinion, however, of those who have devoted themselves to the study and application of this type of medication no reasonable doubt exists as to the importance of what may be termed specific therapy—despite the acknowledged imperfections of the vaccines in use.

**Types of Vaccines.**—Vaccines belong to one of two main types—"stock" or heterogenous—that is to say prepared from a cultivation of the required species of microbe which has already been isolated from an infected individual and after identification stored in the laboratory; and "autogenous," prepared from the actual organism isolated from the particular patient under

treatment. Obviously "stock" vaccines must of necessity be utilised in the attempt to immunise the normal individual prior to exposure to infection by the corresponding microbe. Stock vaccines also possess a distinct value in therapeutic medicine particularly in the case of certain chronic infections such as tuberculosis, but since bacteria exhibit so many biological variations presumably due to the operation of environmental factors, the employment of a number of different "strains" of the same species, thereby rendering the "stock" vaccine "polyvalent," for this purpose is advocated (see also SERUM THERAPY). In the treatment of acute diseases, however, "autogenous" vaccines are immeasurably superior even to polyvalent stock vaccines. When the serum containing the specific immune antibody for a particular strain of micro-organism is available it may be combined with that germ during the process of manufacture and a "sensitised" vaccine—either stock or autogenous, as the case may be—results.

**Detoxicated Vaccine.**—Another variety of vaccine, in which the bacterial protoplasm has been so modified as to remove its toxicity, as well as its infectivity, is known as "detoxicated." Pasteur's anthrax cultures incubated at an unsuitable temperature, and Raw's tubercle cultures grown for a long period of years upon artificial culture media, were detoxicated in this sense by purely biological methods. Recent workers have attempted to effect the same object by treating the bacterial protoplasm with either mineral acids or alkalis. These chemical methods, however, profoundly change the protoplasm of the organism, and the injection of the resulting vaccines into the animal economy is not as a rule followed by the production of any large amount of the "specific" antibodies as at present recognised. That detoxicated vaccines of this type do subserve a useful purpose is beyond question, however, although the mechanism which is here brought into action is probably closely allied to that of protein shock (see IMMUNITY).

**Mode of Preparation.**—All the above varieties of vaccines are prepared on very similar lines. The selected organism is cultivated usually on a solid substratum, under optimum conditions for that particular period which will give the maximum development, and the resulting growth is emulsified in normal saline solution. In the preparation of sensitised vaccines the appropriate anti-serum is added to the emulsion and the mixture is allowed to stand at  $0^{\circ}\text{C}$ . for a period of about 12 hours. Next, the amount of bacterial protoplasm held in suspension per unit volume (1 c.c.) is measured, and several methods are available for the purpose. Undoubtedly the most accurate method involves drying and weighing the mass of bacteria, but this is a lengthy process, and often the time factor is of paramount importance where therapeutic vaccines are concerned. For this reason the plating methods ordinarily employed for the estimation of the number of bacteria suspended in fluids, such as water, are rarely resorted to, and other more rapid methods have been utilised. Thus Sir Almroth Wright mixed equal volumes of the bacterial emulsion and blood from a normal individual, and by means of microscopical films estimated the ratio existing between the red cells and the bodies of the bacteria in the mixture. This ratio having been ascertained, a simple calculation determines the number of bacteria in the unit volume, since the number of erythrocytes normally present in man is a remarkably constant factor (amounting to 5,000 million per cubic centimetre). Again, the bacteria may be counted by means of the ordinary haemocytometer, or the estimation may be made by comparing the suspension of bacteria with standard tubes containing opaque fluids corresponding to definite numbers of various organisms per cubic centimetre.

In most instances the microbes contained in the emulsion are now altered by heat coagulation (by suspension in a water bath adjusted to the thermal death point of the particular organism) by autolysis, or by lysis due to the action of chemicals such as

sodium fluoride or carbolic acid, so that their infectivity is destroyed; in the case of sensitised vaccines the microbes may, at the discretion of the bacteriologist, be left in the living state and unaltered—save for their combination with the corresponding antibody. In the chemically detoxicated vaccines the solution of the bacterial protoplasm is effected at this stage by the addition of the requisite acid or alkali, and the vegetable protein is further purified by repeated precipitation and solution.

Finally, the emulsion, is adjusted to some pre-determined standard by dilution or concentration, a small quantity of a preservative, such as tricresol or phenol, is added and the finished product stored in suitable receptacles.

**VACUUM TUBES** (see 27.834).—The beauty and the interest of the phenomena attending the passage of electricity through gases at low pressures have engaged the attention of physicists for a generation, and a rich harvest of discoveries of the greatest importance has resulted. The discovery of the electron by J. J. Thomson and of the proton by Rutherford have given us the basis of the modern theory of electricity and of the structure of the atom (*q.v.*). The study of the electric discharge tube has further given us, or materially advanced, the X-ray tube, the wireless valve, the electric lamp; the cathode-ray oscillograph, the vacuum flask, mercury vapour and neon lamps, etc. Moreover the requirements of vacuum tube workers have led to the most profound improvements in the methods and technique of producing high vacua, more particularly during the present century.

**Vacuum Pumps.**—The various types of high-vacuum pumps are mostly designed to operate after a preliminary exhaustion to a few millimetres of mercury by a "backing" pump. For this purpose a water-jet pump is sometimes suitable although a piston or rotary oil pump is generally to be preferred. Some types of rotary oil pump are capable of pressures as low as  $1 \times 10^{-6}$  mm. mercury and are rapid in action. It is important to protect them from water vapour.

The Töpler and Sprengel pumps are now little used on account of their slowness of action. This remark applies also to the earlier types of rotary mercury pumps. Dewar's discovery in 1904 of the absorbent properties of coconut charcoal when immersed in liquid air was a conspicuous advance. The process is very rapid for certain gases and is capable of affording extreme vacua, but the necessity for liquid air restricts its general utility.

The molecular pump of Gaede followed in 1913. Holweck has brought out a new design. This depends for its action on the fact that in confined spaces at low pressures the collisions of a molecule with the boundary walls are much more frequent than with other molecules. If one of the walls is in rapid motion it follows that the molecules tend to take up the direction of this motion. The principle takes practical shape in the form of a grooved cylinder revolving at high speed within a cylindrical casing, the clearance being about  $\frac{1}{10}$  mm. or less. The pump is capable of the highest vacua, but is expensive and is occasionally attended by mechanical troubles inherent to the design.

**Gaede and Langmuir Pumps.**—But the method which has displaced almost all others for most purposes is that underlying Gaede's mercury-vapour diffusion pump (1915), of which Langmuir's condensation pump (1916) may be regarded as an independently developed and valuable modification. A variety of types are now available constructed of glass, silica or steel. In all these a blast of mercury vapour, arranged to entrain molecules of the gas to be pumped, is directed tangentially across a

water-cooled surface. The energy of the "reflected" mercury molecules is too small and non-directive to interfere with the direct blast. The gas is accordingly passed on to the backing pump and the mercury vapour is condensed and used again. The highest vacua ( $10^{-6}$  mm. or less) are attainable under suitable conditions, gases and vapours being pumped equally well. The speed of pumping of some types is very high. Backing pressures range from a few millimeters to  $1\frac{1}{4}$  mm. of mercury, depending on the type.

It should be added that, if full advantage is to be taken of the high speed of mercury-vapour pumps, wide-bore (about 1 in. diameter) connecting tubes should be used throughout and the backing pump should be fully capable of keeping pace. A practical convenience with such pumps is the provision of an adjustable air leak (*e.g.*, by a needle valve) for maintaining a suitably high pressure in the discharge tube. If the presence of mercury-vapour in the vacuum tube is objectionable, a trap of liquid air or metallic potassium should be interposed.

In the manufacture of electric lamps and wireless valves the final stages of evacuation are effected by making use of the "cleaning up" properties of red phosphorus, magnesium, etc. The material is deposited on the filament or adjacent supports, and when vapourised by heating results in the reduction of the pressure to a low limit. If it is desired to maintain permanently the highest vacuum in a sealed vacuum tube, it is essential to heat the tube and its enclosures to as high a temperature as possible while the exhaustion is proceeding.

**Electric Discharge in Vacuum Tubes.**—The potential difference required to excite an electric discharge in a vacuum tube depends greatly on the conditions, *e.g.*, the nature and pressure of the residual gas, the size and shape of the tube, the size shape, material and disposition of the electrodes. If the cathode can be heated and if it is coated with one of the alkaline earths, the exciting voltage may be only 50 volts or less at suitable pressures. This is owing to the elimination of the cathode-fall of potential.

If the electrodes are both cold, it is necessary to apply much higher voltages—some hundreds or thousands, such as are yielded by an induction coil or, preferably, some source of constant high potential. The phenomena presented are very varied and of a complexity which has even now been only partly cleared up. Though negative ions may play some part, the current passing through the tube is, in general, carried almost entirely by electrons and positive ions. Their interdependence and essentially different nature lead to the existence of space charges within the tube and surface charges on the walls, which markedly influence the type of discharge.

**Pressure Effects.**—If the pressure is relatively high—say 10 mm. of mercury—the discharge consists of a collection of sinuous and irregular luminous streamers. At lower pressures—say 1 mm. to  $\frac{1}{10}$  mm. of mercury—the tube normally shows the following appearances: (a) the anode glow—a thin film of light over the surface of the anode; (b) the cathode glow—a thin film of light over the surface of the cathode, bounding which is the non-luminous Crookes dark-space, beyond which again is a second cathode glow bounded in turn by the ill-defined and somewhat transient Faraday dark-space; (c) the positive column, sometimes continuous, sometimes striated, occupying the main body of the tube and extending from the anode glow to the Faraday dark-space.

It has been shown that the value of the axial electric field is not at all uniform along the tube, but varies widely as we pass from one electrode to the other. At the anode there is a fall of potential, the extent of which depends only on the current and the nature of the residual gas and not on the nature of the anode. The anode fall appears to be due to an accumulation of electrons near the anode.

**Cathode Fall.**—It is at the cathode that the electrons or cathode rays originate by positive ray bombardment. Schuster, Wehnelt and others showed long ago that an obstacle placed in the Crookes dark-space cast a shadow both ways, as the approaching positive rays and the resulting electrons were simultaneously cut off. The electric field at the boundary of the dark-

space is small but increases linearly with distance from the dark-space boundary until it reaches a high value at a point very close to the cathode where it drops suddenly. The speed of the cathode rays normally corresponds with but little loss to the potential difference between the cathode and the boundary of the dark-space—the so-called "cathode fall." The cathode fall depends on the nature and pressure of the gas, the nature and area of the cathode, and on the current density.

The curiously sharp luminous boundary of the dark-space runs parallel to that of the cathode and is supposed to represent a region of ionisation by the cathode rays, together with recombination resulting in luminosity. It is inferred that, in general, there is a positive space-charge in the dark-space, while very close to the cathode is a negative space-charge due to the production of electrons by positive ray bombardment. The first cathode glow yields a line spectrum and Stark has shown that it shows the Doppler effect by reason of the rapid motion of the luminous particles towards the cathode.

The width of the Crookes dark-space is normally somewhat larger than the mean free path of an electron through the gas. The width depends on the current density and on the gas pressure, it increases as the pressure falls (F. W. Aston, *Proc. Roy. Soc.*, London, 1911) and is frequently used as a measure of the vacuum prevailing.

The positive column may present a uniform column of light or it may be striated, depending on the conditions. The distance between the striations increases as the pressure of the gas is reduced and the diameter of the tube is increased. The electric field in the positive column is fairly small, the conductivity being high. If the positive column is uniform the field is uniform; when the positive column is striated the field is periodic, being greater in the bright parts of the striation than in the dark. The field is very small in the Faraday dark-space, as in the adjacent cathode glow. In the case of the continuous positive column the luminosity is believed due to ionisation and subsequent recombination, produced by a stream of electrons which owe their ionising speed to space and surface charges in the tube. The striations are regarded as due to the insertion, so to speak, of a number of Faraday dark-spaces. The phenomena of the positive column are complicated and appear to be intermittent even with a steady exciting potential, pulses of positive ions and electrons being apparently ejected from the electrodes in opposite directions with different velocities. Whiddington (*Proc. Camb. Phil. Soc.*, 1924) has shown that periodic flashes of luminosity move from anode to cathode with a speed and frequency which increase as the gas pressure is reduced. These flashes do not show the Doppler effect.

With higher rarefactions—say  $\frac{1}{16}$  to  $\frac{1}{100}$  mm.—the positive and negative glows lose shape and luminosity, and the Crookes dark-space grows at the expense of all else. As its boundaries reach the walls they begin to fluoresce with an appearance well known to users of gas X-ray tubes. The exhaustion may ultimately be pressed until it becomes impossible for a discharge to pass in a tube with cold electrodes.

It was with a suitably designed discharge tube that J. J. Thomson first demonstrated the existence of electrons. By using a perforated cathode and allowing the positive rays to stream through, J. J. Thomson and later Aston made measurements of the masses of these positively charged atoms of gas and obtained results which have thrown striking light on the question of the isotopes (*q.v.*) of a considerable number of elements. Incidentally, the positive rays are responsible for two well-known effects with discharge tubes—the pulverisation and "sputtering" of the cathode, and the bombardment and disintegration of the glass walls round the cathode.

In the case of Coolidge X-ray tubes and wireless valves the vacuum is so high that the positive rays play no effective part and the discharge phenomena are considerably simplified. Further, if a Leyden jar discharge is employed for a vacuum tube in which an appreciable amount of gas still remains, the discharge passes as a uniform continuous column stretching from anode to cathode without interruption.

**VAIDA-VOEVOD, ALEXANDRE** (1871– ), Rumanian statesman, was born at Olpret (Transylvania) in 1871. He studied medicine in Vienna and practised for many years at Karlsbad (Karlový Vary). At the age of 28 he joined the National Rumanian party of Transylvania and from 1906–18 sat in the Hungarian Parliament at Budapest, where he waged a permanent fight in defence of the Rumanians in Transylvania. On the collapse of the Central Powers in the autumn of 1918, Dr. Vaida-Voevod was instructed by the newly formed "Rumanian national committee," to voice their claims in the Hungarian Parliament. Invoking the right of self-determination he denied the right of the Hungarian Govt. to speak in the name of the Rumanians of Transylvania and claimed that the latter should have their own representative at the Peace Conference. Soon after, the Rumanian national committee took administrative control of Transylvania and delegated Dr. Vaida-Voevod to represent the Rumanians of Transylvania and the Banat at the Peace Conference in Paris.

In 1919 Dr. Vaida-Voevod was appointed Prime Minister and Minister for Foreign Affairs of Rumania and in the latter capacity went to Paris and London early in the following year to negotiate with the French and British Governments the recognition of the union of Bessarabia with Rumania. This he succeeded in doing in March 1920 when the rights of Rumania over Bessarabia were recognised by the Supreme Economic Council, and afterwards ratified by the Treaty of London Oct. 28 1920. Dr. Vaida-Voevod resigned in the same year and afterwards sat in Parliament as one of the leaders of the National Rumanian party.

**VAIL, THEODORE NEWTON** (1845–1920), American capitalist, was born in Carroll co., O., July 16 1845. Educated at the Morristown Academy, N.J., for two years he studied medicine. Meanwhile he had become interested in telegraphy. In 1868 he became station agent and telegraph operator on the Union Pacific at Pine Bluffs, Wyoming. Then he was appointed clerk in the railway mail service, and his efficiency led to his being made in 1873 assistant superintendent of railway mail service, rising in 1875 to general superintendent. In 1878 he was made general manager of the American Bell Telephone Company. In 1885 he resigned and was elected president of the newly organised American Telephone and Telegraph Co., which in 1900 acquired the American Bell Telephone Company. In 1887 because of ill-health Vail retired.

During a visit to South America he studied traction problems, and in 1896 installed an electric railway system in Buenos Aires, and later introduced telephone systems in many South American cities. In 1907 he was again induced to accept the presidency of the American Telephone and Telegraph Company. When this company in 1910 bought control of the Western Union Telegraph Co., Vail was made president of the latter also, and introduced many changes, including "night letters" at reduced rates. When in 1914, as the result of a threatened suit by the Government, the Western Union was again segregated, Vail remained president of his old company. After the taking over of the wires in Aug. 1918, by the Government as a War measure, he was appointed advisor by the postmaster-general. When the wires were returned in 1919 to private ownership he was elected chairman of the board of directors of the American Telephone and Telegraph Company. He died in Baltimore April 16 1920. See A. B. Paine, *In One Man's Life* (1921).

**VALPARAISO**, Chile (*see* 27.865) has a population of about 185,000. Its modernisation may be said to date from the earthquakes of 1906–7. From ashes and debris streets were widened and paved, better business structures gradually arose and modern sewerage provided a cleaner city. A striking feature of the newer Valparaiso is the increased height of the buildings, many being five or more stories. Harbour improvements, begun

in 1912, represent an outlay of several million pounds. The great depth of the water retards progress, but two breakwaters, building outward from opposite shores of the bay, have attained sufficient length to protect shipping. Eventually 220 ac. of water space will offer protection. In 1923 vessels began to dock at modern piers; a mile of semi-circular stone seawall, scores of new warehouses, modern cargo-handling machinery serve annual imports of 700,000 and exports of 400,000 tons.

The city's civic improvements are striking and beautiful. The Chilean Naval Academy buildings and fine residences are located on heights overlooking the bay. Improved roads connect the upper and lower city. There are numerous passenger elevators. The suburban resort, Viña del Mar, is noted for its splendid buildings, amusements, flowers and society. A railway 117 m. to Santiago, electrified in 1924-5, relieves port congestion. From Valparaíso good highways are gradually extending inland and to the capital. All classes of motor cars are multiplying. Public utilities, advertising and homes are using electricity to an increasing degree. Valparaíso province has about 600 manufacturing enterprises. Factories in or near the city are producing railway cars, clothing, furniture, wagons, shoes, soaps, perfumes and other classes of goods formerly imported.

**VÁMBÉRY, ARMIN** (1832-1913), Hungarian orientalist and traveller (see 27.876), died at Budapest Sept. 15 1913.

**VANCOUVER**, British Columbia (see 27.883), the fourth city of Canada and its chief Pacific port, had an estimated population of 230,000 in 1923 (the suburbs of North and South Vancouver and Point Grey included). The population of Vancouver proper was 117,217, including about 10,000 Orientals, in 1921. The increasing Oriental trade and the shipping of wheat to Europe by way of the Panama Canal have revolutionised the status of the port in recent years. In 1912 there were no shipments of grain or flour, but in 1924 53,240,500 bu. of wheat passed through the harbour. In 1912, 9,382 vessels entered, and in 1922 16,641 with a larger tonnage than that of Montreal in the same year. The wheat storage capacity of the port is now very large, and the whole crop of Alberta can be handled. The export trade is particularly active when the Great Lake ports are closed by ice. Trade is increasing rapidly also in other directions, especially in the export of lumber.

Harbour improvements include two large piers, one built by the Canadian Pacific Railway and one by the harbour commissioners, which increase the capacity of the port for coastal shipping by 35 %. Twenty-four sea-going vessels can now be berthed at once, and further works are in hand. The port is a terminus of the Canadian Pacific and Canadian National railway systems and of over 50 steamship lines. Industrial development is also proceeding rapidly, especially on Granville Island, a large block of reclaimed land near the business district. South Vancouver is a separate municipality, mainly industrial, with a population of 32,182 in 1924. North Vancouver, on the north shore of Burrard inlet, nearly two miles from the centre of the city, had a population of 13,200 in 1921, and a bridge to connect it with Vancouver proper was in course of construction in 1924. Point Grey, with a population of 22,000, is a growing residential suburb to the south and west of Vancouver. The permanent buildings for the University of British Columbia, which has absorbed the British Columbia branch of McGill University were begun at Point Grey in 1921. Stanley Park, an area of virgin forest, is now the property of the Dominion.

**VANDERVELDE, EMILE** (1866- ) Belgian statesman, was born Jan. 25 1866 at Ixelles near Brussels. He studied law at Brussels University and in 1885 took his doctorate in social science. In the following year he joined the Belgian Labour party and soon became its acknowledged leader. He first entered Parliament in 1894 as socialist member for the Charleroi constituency, but after 1900 was returned continuously by Brussels. In the Chamber he achieved both influence and prestige and played a prominent part in the struggle to attain universal suffrage, a struggle which resulted in more than one national general strike. On the outbreak of the War, Vandervelde devoted himself to the problems of national defence, the liberation of his

invaded country, and in Aug. 1914 was summoned to join the Government as minister of state, later becoming member of the Cabinet. At the time of the peace negotiations and the signing of the Versailles Treaty, he used his influence to obtain the insertion of labour clauses, relating especially to the eight-hour day. As minister of justice in the "Liberal-Catholic-Socialist" Cabinet formed after the War, Vandervelde effected great humanitarian and scientific reforms in the prison system. After the important successes achieved by the Labour Party at the general elections of 1925 he entered the "Socialist-Catholic Coalition" Cabinet as minister for foreign affairs and played an important part in negotiating the Locarno Pact in 1925, which he signed on behalf of Belgium.

Considered by some to be the most powerful socialist orator in the French language since the death of Jaurès, Vandervelde has played a very conspicuous rôle in all the international socialist congresses since the beginning of the present century. His speeches in the congresses of Amsterdam (1904), Stuttgart (1907), Copenhagen (1910) and the Berlin international conference of 1922 were epoch making. In 1922 he went to Moscow to defend before the Soviet tribunal the "Revolutionary Socialists" threatened with capital punishment by the Bolshevik authorities, and managed to save their lives. He was for many years president of the international socialist bureau, and it was due to his interest in the education of the working classes that the "artistic section" of the Brussels "house of the people" was formed in 1891. In 1924 Vandervelde was made professor of political economy at the University of Brussels. He wrote for this *Encyclopædia* part of the article on Belgium and was elected a member of the Belgian academy of moral and political sciences.

**BIBLIOGRAPHY.**—Among his works are *Le socialisme en Belgique*, with J. Destrée (1898); *Le collectivisme et l'évolution industrielle* (1900, trans. by R. P. Farley 1907); *Essais sur la question agraire en Belgique* (1902); *La Belgique et le Congo* (1911); *La grève générale en Belgique, avril 1913* (1914); *Le socialisme contre l'état* (1918); *Réalisations socialistes* (1923); *Le parti ouvrier belge, 1885-1925* (1925).

(J. Lo.)

**VAN DYKE, HENRY** (1852-1914), American writer, was born at Germantown, Pa., Nov. 10 1852. He studied at the Brooklyn Polytechnic Institute, Princeton University (M.A., 1876), the Princeton theological school and the University of Berlin. In 1879 he entered the Presbyterian ministry, being pastor at Newport, R. I., and from 1883 to 1900 pastor of the Brick Presbyterian Church, New York City. In this capacity his preaching gave him a national reputation. From 1900 he was professor of English literature at Princeton. During 1902-3 he was moderator of the Presbyterian Church in the United States. In 1908 he was appointed American lecturer at the Sorbonne and in 1913 was appointed, by President Wilson, minister to Holland and Luxembourg, but resigned in 1917 to enter the U.S. Navy as Lt.-Commander, Chaplains' Corps.

His books, both prose and in verse, give him a high place in modern American literature. Among his best works are his "outdoor essays," especially *Little Rivers* (1893) and *Fisherman's Luck* (1899). His other publications include *The Reality of Religion* (1884); *Days Off* (1907); *The House of Rimmon* (1908); *Out-of-doors in the Holy Land* (1908); *Collected Poems* (1911); *The Unknown Quantity* (1912); *Fighting for Peace* (1917); *The Valley of Vision* (1919); *Camp-Fires and Guide-Posts* (1921); *Half-Told Tales* (1925).

**VAN HORNE, SIR WILLIAM CORNELIUS** (1843-1915), Canadian financier (see 27.894), died at Montreal Sept. 11 1915.

**VAN'T HOFF, JACOBUS HENDRICUS** (1852-1911), Dutch chemist and physicist (see 27.896), died at Steglitz, near Berlin, March 1 1911.

**VAPORISATION:** see HEAT.

**VARIABLE TRANSMISSION GEARS.**—This article is concerned only with variable transmission of power, and not merely variable speed transmission, otherwise it would have to include the consideration of a multitude of appliances such as speed indicators, integrators and many kinds of calculating machines.

Power transmission gears may be divided into two classes (1) that in which there is a step by step change and (2) that in which

the change is gradually effected and an infinite range of velocity ratio is possible.

Step by step variable gears are familiar to all who have passed through an engineer's workshop, in which lathes, drilling machines and other tools operated by stepped belt pulleys or trains of wheels of different size, these devices being employed to effect variable transmission. A familiar example on the roads is the motor-car, in which with very rare exceptions the change of speed is effected by means of a gear box containing a number of different sized pairs of tooth wheels, arranged so that a change of speed can be effected at will by operating a gear lever. On the other hand infinitely variable transmission is less familiar and until comparatively recent times had no particular application except for very light powers. The increasing employment of infinitely variable transmission is due to the fact that the electric motor, steam turbine, but most of all the internal-combustion engine (*q.v.*) have for many purposes superseded the steam engine. One feature of the greatest value in the steam engine is its flexibility, the inferiority in this direction of other kinds of motive power being very marked. Hence there have been continual attempts to find either by frictional, electric, hydraulic or other means some form of infinitely variable transmission.

A case where variable transmission would constitute a vital factor is the heavy locomotive, and here up to the present no effective variable transmission has been devised which can re-

FIG. 1.—Diagram showing the step pulley system of frictional gear for an ordinary lathe.

place the flexibility of the steam locomotive, although there are enormous tracts of country where water is scarce, which the internal-combustion locomotive might open up to civilisation.

Probably more inventive effort has been employed in finding some form of infinitely variable transmission for motor-cars than for any other purpose, but step by step mechanism with all its obvious disadvantages still holds the field, being up to the present superior in the two vital points of weight and cost.

Before proceeding to describe various types of variable transmission it must be understood that it is quite possible to vary the speed of transmission by a slipping clutch and claims are often put forward for such a clutch as effecting infinitely variable transmission. This, however, is not correct, being only a case of

variation in speed by a direct loss of energy and not true variable transmission. The true test of variable transmission is as to whether it fulfils, at any rate approximately, what is called the Law of Work that "what is lost in force is gained in speed" and vice versa. Thus, for instance, apart from the

FIG. 2.—Diagram showing an infinitely variable transmission by pulleys.

unavoidable loss of efficiency due to friction either with a train of wheels or a combination of belt pulleys, these obey the law of work and overcome a greater resistance by a corresponding reduction of speed. On the other hand, if a lesser resistance is to be overcome the rate of operation can be proportionately increased by suitable alteration of the train of wheels employed.

*Classification of Methods.*—In order to understand the different types of variable transmission they may be classified under the

FIG. 3.—Modern form of variable transmission, as applied to motor-bicycles.

following heads: Frictional, Mechanical, Pneumatic, Electric and Hydraulic.

**Frictional.**—Fig. 1 shows the step pulley system for the ordinary lathe, the lower series operating in the headstock of the lathe, and the upper on the driving shaft. As the belt is shifted from left to right off and on the different pulleys the speed of the lathe can be increased; or when from right to left the opposite

which respectively operate the movable cheeks ( $d_1d_2$ ) of the conical pulleys either inwards or outwards. Probably the oldest type of infinitely variable gear is that shown in fig. 6, in which a friction roller is moved edgewise to and fro on the disk or circular flat plate  $p$ . If, as in a certain type of motor-car,  $r$  is the

FIG. 4.—Cross section of pair of expanding pulleys.

effect is obtained. Corresponding to step by step movement, fig. 2 shows an infinitely variable transmission by pulleys which forms part of the cotton spinning device of Houldsworth invented just a century ago. Here the variation of speed between the driving and driven pulleys is obtained by shifting the belt to and fro along drums of nearly conical form. Fig. 3 shows a modern form of variable transmission as applied very successfully to motor bicycles. Here the pulley is of a "V" shape, shown in cross section, and having driving and driven pulleys both capable of expansion and contraction. This expansion or contraction is effected by shifting in one direction or another the conical movable side of the pulley. The closer the sides come together the greater will be the effective diameter of the pulley. This device is given in greater detail in fig. 4 which figure shows the pair of pulleys in cross section. In the latter diagram it will be seen that powerful springs ensure that the driving belt shall be gripped on both pulleys, an idle wheel running between two pulleys in order to accurately secure the correct location of the conical surface.

A development is now taking place of this type of variable transmission for larger powers. Fig. 5 shows how the variation of the distance apart of the conical sides of a driving and driven pulley is effected when much power has to be transmitted. The hand wheel ( $a$ ) operates a combination of worm and worm wheel ( $b$ ) so as to turn to other worms ( $c_1c_2$ ) and thereby move levers,

FIG. 5.—Diagram showing how the variation of the distance apart of the conical sides of a driving and driven pulley is effected when much power has to be transmitted.

FIG. 6.—Infinitely variable gear in which a friction roller is moved edgewise to and fro on a disk.

driver, the speed of the driven disk  $p$  is least when  $r$  is nearest the edge, and the greatest driving force is then obtained. On the other hand, when  $r$  has approached towards the centre of the disk  $p$  the greatest speed is obtained with corresponding reduction of driving force. The power transmitted with this gear is however comparatively small as it depends entirely on frictional contact of the surfaces and the wear of the frictional surfaces is considerable.

A novel type of variable friction gear was exhibited at the London Power Exhibition in 1885, operating a sackhoist. This transmission, although not of much practical importance, has certain interesting features, and although not used for power purposes has been largely employed as a spherical integrator. The principle of operation is the movement of a sphere which in the above case was a steel ball. This sphere was supported in a frame by four friction rollers, the frame being pivoted on a vertical axis. In contact with the sphere, in a horizontal plane, were the driving and driven rollers, the axes of which were at right angles to each other. By swivelling the frame the relative velocities of driving and driven wheels could be altered between any required velocity ratios; a discussion of the theory being given in *Phil. Trans. Roy. Soc.*, Part II. 1885.

**Mechanical.**—Variable transmission of mechanical kind can be said to be practically confined to the employment of trains of toothed wheels. The most familiar case of all is that of a lathe headstock shown in fig. 7, in which by coupling up the largest

FIG. 7.—Variable transmission as used in a lathe headstock.

step pulley to the spur wheel to the spindle of the headstock a direct drive is obtained from the speed pulleys. If this coupling is released and by means of a handle shown in the figure the back axle is approached to the main spindle so as to bring into engagement the two pairs of tooth wheels, the driving now takes place through the pinion driven by the step cone pulley

through the axle shaft, and back to the lay spindle. Increase of driving force is thus obtained which in the present example is nine times as great as by the direct drive.

Fig. 8 shows the clutch type of motor car change speed gear box, in which the engagement of different ratios of spur wheels and pinions is obtained by sliding the teeth sideways into mesh with each other. This is called the "clash" engagement. In

FIG. 8.—Clutch type of motor car change speed gear box.

this diagram the whole transmission is shown out of gear. In another type of gear box no such sideways sliding takes place, the teeth of the respective wheels being always in mesh with each other. Change of gear is effected by sliding the different jaw clutches into engagement with each other.

For many years inventors have aspired to produce an infinitely variable mechanical transmission on the principle of ratchet motion, in which by altering the positions of the fulcrum of a lever operating a driving pawl, relative variation of force and speed is obtained without any variation in the driving effort. One form of this gear of extremely interesting character is a French invention by de Lavaud which operated quite effectively on a small motor car. More attention, however, has been attracted by the torque converter of Constantinesco. The latter is a ratchet gear, but has practically no resemblance to the gear of de Lavaud and appears to introduce an entirely new mechanical principle, in which as the velocity of the motor increases the inertia effect of a weight changes the position of the fulcrum of the lever and causes an impulsive effort to be given to what is called the secondary shaft by the movement of what is called the primary shaft. Although this gear has been applied both to a motor car and to a locomotive, as well as to other purposes with remarkable results, it can scarcely be said at present to be beyond the experimental stage, the difficulty of the invention being to find an effective friction ratchet, or as the inventor calls it, a "mechanical valve," which will satisfy all the conditions of practice.

**Pneumatic.**—Many attempts have been made to introduce pneumatic variable transmission since 1900 by Dunlop, Lenz, Lebach and others. The best account of these pneumatic devices as applied on a large scale to locomotives was given in *La Revue Générale des Chemins de Fer*, May 1923, by Brillé. Up to the present these devices, though extremely interesting and ingenious, have not proved efficient in practice.

**Electrical.**—Various inventors have suggested continuously variable electric change speed gear. As already explained a mere reduction of effort by interposed resistance is not a true variable transmission, and all the most important examples of real variable electric transmission as on electric railways, is of essentially a step by step nature. Locomotive systems such as Crochat's mine locomotive, the loco-tractor of Moyses, those of

Westinghouse, of Sultz Diesel and Dewa are on the same fundamental principle as the Tilling-Stevens electric transmission, namely, production of electrical current by a dynamo from an internal-combustion engine and the operation by an electric motor of some form of gearing to turn the wheels. In the electric railways there is no variable transmission apart from the driving motor itself, and as far as the writer is aware there are no cases on a large scale of an internal-combustion motor operating directly through self-contained electrical variable gear.

**Hydraulic.**—The last form of transmission, and in its development the most recent, is hydraulic transmission. A beautiful device by Hastie was described as long ago as 1881 in the 9th Edition of *The Encyclopædia Britannica*, in an article on Hydromechanics. By means of two springs the stroke of the crank can be altered, when the crank pin slides in a groove.

When the effort is great the springs are compressed and the stroke is increased correspondingly, enabling a constant hydraulic pressure to overcome a variable resistance. This resistance may vary within wide limits, with the corresponding economy in the matter of the fluid employed. In the foregoing case the working fluid was water supplied by a high-pressure hydraulic main on the principle first introduced by Armstrong. Modern hydraulic variable gear in which oil is the working fluid has been brought into extensive operation chiefly to enable electrical power to overcome very variable resistance without unduly causing a rise in the amperes transmitted. The principle of operation is exactly identical with the generation of electrical current by a dynamo, which current is transformed into mechanical effort by an electrical motor. In the case of hydraulic transmission, however, a variable stroke pump is employed to produce a flow of incompressible fluid, generally oil, which operates in a hydraulic motor. Thus it is only necessary to effect a change in the stroke of the pump when any required hydraulic pressure can be obtained without unduly increasing the driving effort on the pump.

Hydraulic variable gear has been employed for a great variety of purposes such as cranes, lifts, winches, tipping wagons, rail cars, gun mountings, planing and broaching machines, swing bridges, etc. The chief types of these gears may be distinguished as parallel and radial. Fig. 9 shows a section of the Janney-Williams gear (either pump or motor) which is an example of the former type, and it will be seen that the variation in effort is attained by varying the angle of what is known as the swash

FIG. 9.—Section of the Janney-Williams hydraulic variable gear.

plate, with the result of altering the stroke of the pistons. As the stroke is reduced the working pressure can be increased; thus when the stroke is very small a very great pressure can be produced and consequently great resistance can be overcome. The necessary valve action is obtained by causing the opening at the inner end of the cylinders to pass alternately in succession supply and exhaust ports.

Fig. 10 shows the operation of one radial type pump. The cylinder body revolves about a fixed axis which forms a cylindrical valve. As the cylindrical body revolves, the working fluid is alternately admitted from and exhausted into the two ports *a* and *p* respectively. The fluid comes in under no pressure from the

port *a* and is driven out under any required pressure from the port *p* along the shaft. In order to obtain any required variation of pressure the frame to which the connecting rod ends are attached is made to pivot about the fixed centre *c* by a rod attached

FIG. 10.—Diagram showing the operation of one radial type pump.

to the upper end of the frame. In the middle position there is obviously no stroke, and when the neutral position is passed the direction of flow is reversed.

Two views of another type of radial stroke pump are shown in fig. 11 (Hele-Shaw Pump), the left-hand view being in half section, the lower portion of which shows *ff* a revolving case

FIG. 11.—Two views of the Hele-Shaw radial stroke pump.

called the "floating ring." The sectional portion in the view shows that this floating ring is carried on ball races *r* and *r*, their object being to reduce the frictional wear of the rollers or slippers by allowing the floating ring to rotate freely with the cylinder body, in which the pistons are carried. If the floating ring is moved bodily along guides on the line *a-b* (shown in the other view) the stroke of the pistons and the fluid pressure can be varied as required, just as in the previous example. The action of the fixed cylindrical valve is exactly the same as in fig. 10, the employment of the four cylindrical passages in the shaft instead of two being simply a matter of design.

While the floating ring is found to give almost indefinite life to the pump there was a characteristic hum or noise which was after years of research traced to the same deformation that produces the sound in a bell. The latest form of radial variable stroke radial pump, while employing the same type of cylindrical valve is found, when properly designed, to be almost silent. The floating ring is dispensed with, variation of stroke being obtained by allowing the pistons, which work inwardly instead of outwardly, to be operated by the equivalent of a crank in the form of a live ring mounted with roller bearings on a compound eccentric. The compound eccentric consists of two parts of equal eccentricity, the stroke varying mechanism being arranged to effect rotation of these two parts in opposite directions with the result that the resultant eccentricity may be varied at will from zero to maximum in either direction. This gear was fully described in *Engineering*, Oct. 16 1925.

**VARIETY THEATRE** (see MUSIC HALLS, 19.87).—The history of the European variety theatre since 1911 is a regrettable chronicle of the gradual decline of an old and hitherto extremely popular form of entertainment, and its waning hold upon the imagination and support of the public at large. In the quarter of a century preceding the War the variety stage generally had evolved to a position of paramount importance in the entertainment world. It touched the zenith of its popularity in the first decade of the 20th century since when it has retreated from popular favour with markedly greater rapidity than it had previously advanced.

The reasons for this decline are manifold. In the first place and to the most superficial observation, it is clear that the principal requisites of successful variety entertainment, that is, performers of exceptional ability endowed with magnetic personalities, have not been produced during the present century in sufficient numbers to maintain the music hall as a whole in its former pre-eminence. In the case of the British industry, for example, the great artists of the earlier generation, who delighted the public from end to end of Great Britain and whose names were household words throughout the Empire, have not been replaced in any sense by the younger generation. The death in the early years of this century of Dan Leno, the greatest, probably, of all entertainers in this particular field was an irreparable loss and in its way marked the beginning of the end of the era of variety. Leno possessed in the greatest measure that personal histrionic art which, while it inspired laughter, touched also often so nearly on tears.

*The Art of Personal Exploitation.*—The art of the music hall is essentially the art of personal exploitation. It differs from its sister art of the theatre in that the variety artist has to create his own mood almost without the aid of any intermediary. He is directly face to face with his audience and, broadly considered, his principal effects are those of personality accompanied, of course, by technique. But, primarily, it is the individuality of the performer rather than his choice of material which determines his success or failure. Leno, like all the finest artists of the music hall, such as the French clown Grock, relied but little upon his material. But his self-exploitation was entertaining and apparently illimitable. Leno stands, and will probably stand for all time, as the personification of the British music hall at its best and most successful. Marie Lloyd, who died in 1923, was another artist whose popularity was only equalled by her remarkable abilities. She, like Leno, was unsparing of her gifts and like him, too, she had at command that authoritative persuasion of an audience which is so rare a gift but which is always essential to the highest achievement of the histrion.

Another supreme product of the British music hall was Albert Chevalier whose Cockney characterisations expressed the London of his time as directly, as intelligibly and as sympathetically as

Yvette Guilbert expressed the Paris of the '90's. Chevalier possessed a remarkable gift for assuming character as well as for exploiting his own characteristics. His art therefore partook, more than did that of many other leading music hall performers, of the "legitimate" drama. Among the great impersonators one who has left the variety stage the loser for her retirement is Vesta Tilley, who, in her own field of male impersonation, stands unapproached. All these artists, with many others who have died or retired and others who still appear, were the direct product of a régime very different from that obtaining in the present world of vaudeville. To understand how such a great number of performers could have appeared in one generation, it is necessary to glance back at the evolution and conditions of the theatre which produced them.

*Origins of the British Music Hall.*—The British music hall, like its continental similars, derives primarily from the smoking concert or "free-and-easy" of early Victorian times. To these informal premises, usually associated in the first instance with licensed concerts, came a number of amateurs or semi-professional entertainers who plied their trade of amusement in a more or less haphazard way. That is to say, the majority were not in the true sense of the word professionals at the outset. Those who merited popular appreciation naturally became assets of the managements concerned and gradually attained professional status owing to the continuous demands upon their services. From such humble beginnings was the great British music hall industry developed. The next phase followed naturally from the first. The "free-and-easy" established itself as the small music hall, giving regular nightly or twice-nightly performances, and by the middle of the 19th century numerous music halls were carrying on a prosperous trade.

The artists of this régime were in direct contact with their audience. They had to establish themselves as entertainers or step down to give place to others more capable. But the decentralised control of the early music halls (and this is true of the continental houses as well as the British) meant that each proprietor sought for talent suited to his own particular public. It was therefore possible for an individual artist to familiarise himself with a more or less specialised audience. If he succeeded he might move on to wider conquests. But he had ampler opportunities than does the variety performer of to-day of testing his personality, his talent and his material and in winning the chaff from the grain.

The managements, too, were in a more direct relationship to their immediate public than are the directorates of the big syndicates who nowadays control practically the whole world of variety. Thus a more intimate personal relationship, so vital to successful showmanship, was a feature of the earlier variety world and thus were brought to fruition the talents of the great race of music hall performers.

*Syndicates and the Decline of Variety.*—When once these artists had created a prosperous industry, however, a system of managerial exploitation very different from this personal direction began to evolve. During the early years of this century vast syndicates "cornered" variety. The inevitable sequel to this amalgamation and centralisation of control was reckless speculation in the leading personalities. "Star" salaries beyond the most avaricious dreams of the old performers began to be the order of the day. Artists of any standing were given long-date contracts at long prices. The few big syndicates rivalled one another in luring under their management all established artists. But that very lack of personal management, so evident in the syndicate system, was destined to affect disastrously the prosperity of the industry which the syndicates monopolised. For syndicate control has notably failed to encourage and advance the art of the emergent performer and in the course of a very few years the race of the giants was without succession. With a decreasing number of powerfully attractive personalities, the music hall began to languish.

The internationalisation, or rather denationalisation, of the music hall has further depreciated its attractiveness, especially in so far as European countries are concerned. America with

its cosmopolitan public and with its very considerable proportion of Jewish theatrical patrons is in a somewhat different position. In Great Britain, France, Germany and Austria, however, there is no doubt that the music hall since 1910 has suffered from the decrease in the embodiment of national character and characteristics on the various vaudeville stages. This is another aspect of the changed conditions of financial control which has led to a measure of international exchanges of talent comparatively unknown in former years. In the British music hall, for example, artists like Sir Harry Lauder, J. W. Rickaby, George Robey, George Formby, Harry Weldon, Nellie Wallace, Lottie Collins, Louie Freear and many others characterised or caricatured a person, a district or a race easily recognisable and intimately observable by the public. They made the art of the music hall as familiar almost as the very households of the public. The cosmopolitanisation of variety has produced nothing to replace this attractive homeliness.

*Revival of Vaudeville in France.*—The character song is the backbone of the best and most successful of music hall entertainments and, while the dearth of this is perhaps more than anything else responsible for the waning attraction of present-day vaudeville, it is to be noted that in France a most significant revival of the typically national lyric, suitably set to music, has sponsored a very definite revival of popular esteem of variety. French vaudeville is indeed recovering rapidly its hold on the public. Like the British "free-and-easy" the French café-concert was almost wiped out. Fortunately, however, extinction was not complete and the recent success of the great Parisian music halls, Olympia and the new Empire, have profited by their encouragement of French music hall singers. The *chanson* has again become a part of French national life. This revival was in part assisted by the encouragement of several of the favourite artists of an earlier generation to reappear on the music hall stage. Some of these *chansonniers* and the songs thus resurrected, renewed their former success in surprising fashion. Mayol and Yvette Guilbert, returning once more to the scenes of their former triumphs, are outstanding examples of this. Their performances have encouraged a number of new lyrists, composers and singers to develop their art to the advantage of the music hall industry as a whole. Aristide Bruant, the inimitable ballad singer of the Montmartre of other days, not long before his death in 1925 returned to delight the Parisian public and added a notable quota to the revival to neglected songs of the boulevard.

The French Press has been of great assistance to the new growth of interest in the music hall. Whereas in England the music hall, although tolerated and occasionally patronised by distinguished theatrical journalists, has never been taken seriously as a department of theatrical art, in France informed criticism and helpful publicity have been a feature of modern Parisian and provincial journalism. Another factor which has undoubtedly furthered the cause of French vaudeville has been the establishment in Paris of permanent circuses. These have created a desire for, and developed the talent of "dumb acts."

It is true that a tentative effort was made to re-introduce several of the once famous personalities of the music halls to the London public: Arthur Roberts, Charles Coborn and others were persuaded to appear in their former successes, being billed as "veterans of variety." But the British impresarios concerned in this venture seemed more concerned to show these masters to the public as oddities or freaks of entertainment and to indicate to the audience the strange tastes of the preceding generation than, following the example of their French colleagues, to revitalise the most important province of the art of the music hall, the characteristic song.

Syndicate control led also to great changes in the atmosphere of the entertainment houses. Vast palaces replaced the simple halls of other days and thus decreased the intimacy of contact between the stage and the public, thus requiring a broadening of the illusionary effects of individual artists, whose very audibility indeed became menaced by the increasing size of the halls in which they were called upon to perform. The material or "numbers" used by artists have been disastrously "commercialised"

in like manner under the new system. Formerly any artist had virtual monopoly of his "business," "patter," "props" or songs. Now these are freely used by almost all comers who care to pay the fee for the performing rights. There is thus little encouragement to the individual artist to obtain or to the composers to provide first-rate exclusive material. Syndication has indeed reacted throughout most unfavourably upon the artistic appeal of vaudeville.

*The Bane of "Refinement."*—In response to sundry puritanical attacks on popular entertainment the refinement of the music hall began with this century. Artistically it may be said to have commenced with the appearance of Albert Chevalier. This great creator of Cockney types was, however, in no way responsible for the development of the so-called refining influence which robbed the music hall of its happiest and healthiest attributes and led to the transplantation to its stage of the worst elements of the concert-room and drama-house. Inferior musical turns, poor sketches performed by merely adequate "legitimate" artists were among the phenomena of attempted refinement, which actually only resulted in debasing the music hall as a whole.

The introduction of eminent dramatic artists in feeble one-act plays has done nothing to reflect credit on either the artists or the managements concerned. For it must be noted that the advent of artists with great reputations from other spheres of the entertainment world, whether dramatic or musical, has almost invariably been considered an act of condescension. This is generally unfavourable to the efficiency of variety because the technique of the music hall is a technique of its own, requiring immediate *rapprochement* between audience and player and a much more direct liaison between stage and audience than does the ordinary or concert performance. This technique is difficult to acquire and the only theatrical artists who have continued to hold the interest of the music hall public have been those who, like Chevalier, adapted, broadened and sharpened the dramatic technique to suit the needs of their new environment. The names of notable theatrical artists on the bills of the variety theatres have often proved a false promise, since the work which they have contributed has very seldom been up to the standard required. The introduction of big names unbacked by the "goods" has undoubtedly done definite harm to the industry. This is another aspect of the refinement of the music halls which must be in large measure ascribed to the introduction on the managerial side of amateur showmen, recruited from the ranks of accountants, lawyers and other professional men associated with the controlling syndicates, who have taken the place of the individual proprietors of other days.

Thus the decline of the British music hall has been brought about, and whereas French cabaret is continually providing new blood to revivify the French music hall no such revival is noticeable in Great Britain. For British cabaret seems content to avail itself of cosmopolitan and mostly American artists whose material is largely negroid or Semitic of inspiration and certainly reflects little or nothing of the characteristics of the various British folk-traditions. In Germany and Russia the divorce between the music hall and cabaret is almost complete, the Middle European music hall comprising almost entirely "dumb acts." Not only have theatrical illusion, strong character and robust comedy been driven out as a result of alleged respectability, but the characteristic costumes of the acrobats have given place to shirt and trousers or to the even more incongruous evening dress, and in other respects the old professional glamour has been almost abolished.

Officious interference which, with the consent of the syndicated directorship, thus made itself felt inside the music hall was also busy outside. The sale of intoxicating liquors, formerly an integral part of a variety entertainment, was soon limited to the bars and eventually the London County Council, the most important licensing authority, whose example was naturally followed by similar bodies in other districts, prohibited the sale of intoxicating liquors in all variety houses. Only towards the end of 1925 was this harassing, inconsistent and unfair regulation

removed after sustained agitation carried on during a number of years by the entertainment proprietors immediately affected and backed by a considerable body of public opinion.

*Other Adverse Influences.*—The above must be considered the principal factors contributory to the decline in popularity of the music hall. But social changes have also had their effect. The World War provided a vast influx of prosperity to most types of entertainment. Concentrations of troops near the large towns, the passage of innumerable colonial and foreign migrants and the general desire to escape for a few hours from the stern realities of existence by the aid of entertainment, led to the expenditure at the box offices of a great deal of money which otherwise would never have found its way thither. But War-time vicissitudes undoubtedly reduced the artistic level of variety. A large number of entertainers were drawn to the colours, many gave their lives on the various European fronts and the careers of many more were harshly interrupted.

The later post-War years, which have witnessed a continuation of the pre-War decline of variety, have witnessed a very definite revival of the drama proper and of musical comedy. These have usurped to some extent not only the popularity but even the premises which were formerly devoted to vaudeville entertainment. This is distinctly seen in London where the Hippodrome is a more recent convert to the successful American type of musical comedy, which seems destined to oust the formerly popular Viennese type of operetta. The London Pavilion is now most successfully devoted to spectacular revue of the more cultivated type and the Palladium frequently houses revue productions of a more democratic style. The Empire, formerly a famous and much frequented variety theatre, has recently been the home of film and musical productions, even of "straight" drama. Innumerable provincial houses have likewise succumbed to the superior attraction of revue and cinema.

A remarkable exception to the general enfeeblement of vaudeville is the London Coliseum which, under the direction of Sir Oswald Stoll, has achieved a leading rôle in the entertainment world of London. This house, however, cannot be considered as a typical modern music hall. It is indeed a law unto itself, the individual product of discerning and novel showmanship. While its performances consist largely of variety turns, these are frequently reinforced by novel features. The frequent appearance at this house of items from the repertory of the Diaghilev Ballet, Comédie Française, productions by specialised dramatic troupes (*Sumurun* by a German company, the Scottish National Players, etc.) have added to the reputation of this unique and popular place of amusement.

Considerable developments of transport, excursion and holiday facilities both by rail and road, have naturally reacted upon theatrical entertainment. The great increase of athletic opportunities has caused sport to draw its quota from indoor amusements. The rapid growth of the cinema as a popular relaxation was probably the most serious rival of vaudeville in the years immediately preceding the War. But present-day tendencies seem to suggest that the cinema has touched the zenith of its popularity and the fact that many of the big film houses are interpolating variety acts into their programme (this is especially the case in America) has led those interested in the welfare of the variety artists to claim that the future of vaudeville may well lie in the direction of a considerable co-operation between this and the motion-picture industry.

*Rise of Revue.*—In spite of the enormous developments of the cinema during the period which we are considering, it is probable that the most serious rival of the music hall at the present time is revue. Attempts had been made before the War to promote entertainments in some way similar to the performances which have achieved conspicuous success on the Continent, either in intimate form, as the Capucines or Palais Royal (where *scènes d'actualité* were the principal items) or in spectacular style as at the larger music halls, Folies Bergère or Casino de Paris. Revue had long been a favourite pastime of the continental theatre-goer. It was, however, not until 1914 that revue as an art-form caught the imagination of the British public to any

considerable extent. With C. B. Cochran's production of *Odd and Ends* at the Ambassadors' Theatre, revue may be said to have been launched on its successful career in this country. This entertainment and its immediate successors were in the nature of *revues intimes*, but the first experiments proved emphatically successful and so much to the liking of the public that numerous other impresarios rapidly adopted this type of entertainment and proceeded to exploit it both in the London area and throughout the country.

Revue evolved from the intimate to the spectacular with astonishing celerity. It is probable that the emotions of War-time were in a measure responsible for the immediate and ready acceptance granted to this new type of entertainment. However this may be, revue certainly displaced both the legitimate drama and the older type of variety entertainment to a great extent in the various amusement resorts in Great Britain. Unfortunately the apparent ease of production and the elasticity of the revue-form led to its abuse by a number of inexperienced or incompetent managers. But revue at its best as an intermediate form between drama and the typical music hall bill has certainly recommended itself to a large and discerning body of theatre-goers. The ideal revue is no mere haphazard collection of numbers, no mere *pot-pourri* of music hall turns, dramatic sketches, dances and so on. Its ingredients need the most careful mixing. It must develop in as orderly a manner as a symphony, and the laws of revue composition, although unwritten, are as exacting as those of a pictorial design. In the past few years some of the purest gems of theatrical art have been seen in revue productions. Many scenic artists, actors, dancers and technicians of the theatre have developed their talents in this field and not a few others have found here a means for fuller self-expression than they have discovered in any other department of the theatre.

(C. B. C.)

#### THE VARIETY THEATRE IN THE UNITED STATES

*Beginnings.*—As in England and on the continent, variety was one of the very early forms of theatrical entertainment in the New World. During the last decade of the 18th century, in most of the larger cities, resident theatrical companies presented alternately legitimate production, generally farces and comedies, and variety programmes. Company members and guest stars visited from one city to another, augmenting these local stock companies. In the last few years of the 18th century and the first of the 19th, variety became permanently dissociated from dramatic and operatic production, of which until then it had been an interlude or added attraction, and there began the policy of assembling complete programmes of music hall turns and specialty artists of varied talents.

At the beginning, variety was a theatrical stepchild. The halls in which variety had its birth in America were miserable enough, hardly better than stables. Frequently they were on the second storey, over stores, in rooms originally intended for dance halls. Such "theatres" generally eventuated casually, instigated largely by dance hall patrons who conceived the notion that they could jig, or sing. A brisk trade in refreshments augmented the rather informal entertainment. To facilitate this, patrons sat at tables. Sawdust or sand besprinkled the floor. Later variety theatres often had a museum adjoining, in which an exhibition of freaks, human and otherwise, served to amuse and attract the overflow.

*The Period of Barnum and Tony Pastor.*—By 1830 variety was an established and flourishing theatrical enterprise. Phineas T. Barnum, the great circus man, was early attracted to this form of entertainment. In 1835 in a hall on Chatham Street, New York City, his variety endeavours began with the exhibition of Joice Heth, later supplemented with Signor Vivalia, juggler and equilibrist of the Cinquevalli order. Adding several other attractions, he took this show on tour the following year, playing in a tent around the east and south, a forerunner of his circus activities. Back again in 1841, he continued variety for a short time in Vauxhalls Gardens, New York City.

Following Barnum there were numerous adventurers in vari-

ety. Between the days of his initial show in 1835 and the opening of Hoym's theatre in 1858, the first playhouse built expressly for variety, every one of New York's sixteen theatres was at one time or another given over to variety. But it was not until after the Civil War that variety acquired any firm foothold among American theatricals. In 1866 Tony Pastor, famous New York showman, took over the Hoym Theatre which he held for nine years.

The period was rich in personalities, in artists not excelled among stars of modern vaudeville. Many who later made their mark in legitimate drama were seen singly and in pairs in "acts" at Tony Pastor's, at Niblo's Gardens, at the Eagle theatre. Such supreme entertainers as Harrigan and Hart; Weber and Fields, whose low buffoonery was infinite artistry; the Four Cohans; Flo and May Irwin; Nat C. Goodwin, Jr.; the glorious blonde Lillian Russell; Montgomery and Stone; Hallen and Hart; Pat Rooney; Evans and Hoey; Maggie Kline; and Tony himself, were a few of the lights of those days.

Many of the prime successes in American variety were teams. Whereas the ballad and the popular song were the mainstay of European variety, the comedy sketch, generally enacted by two or more, was the *piece de resistance* upon American programmes. Often whole families appeared in such acts, as the Four Cohans, the Four Mortons, the Lauri Family and the Vokes Family.

*Vaudeville.*—Just when the word "vaudeville" began to be used in this country is not recorded. A program for Vauxhalls Gardens for August 1 1842 uses the word, and Tony Pastor employed it several times in 1877. In following years other managers took it up. But until the '80's it had no particular significance; it was merely a change from the overworked word "variety." Vaudeville as something to be distinguished from variety, as a revised and refined edition of the latter, came into being in 1882, conceived by a Boston showman, B. F. Keith, whose name has gone down in American theatrical annals as the father of modern vaudeville. He was an ex-circus man who started on his own as proprietor of a small dime museum and variety show in a meagre store building in the heart of Boston. His emporium differed from other variety houses in one particular feature—it was uniquely clean. In 1885 he was joined by Edward F. Albee, his eventual partner and successor, and present head of the Keith-Albee vaudeville circuit. Together they fought for Keith's dream of putting variety on a par with the legitimate theatre, a dream never quite attained but admirably approached.

In 1887 Messrs. Keith and Albee presented the first variety sketch with a legitimate star as principal. The star was Francesca Redding, a popular actress of the day. The success of that venture opened the way for a long parade of legitimate stars across the vaudeville stage. E. F. Albee enticed such dramatic celebrities as Maurice Barrymore, David Warfield, Ezra Kendall, Eben Plympton. An event of 1897 was the presentation of Clara Morris, then at the height of her legitimate career, in vaudeville at Keith's Union Square, New York. Her appearance moved one New York critic to write: "Vaudeville just now seems to be the goal of dramatic aspiration. We may yet see the day when the Divine Sarah will take it. But I can't help saying that I think not." Despite his thoughts, a few years later Bernhardt became one of the highest salaried and most popular headliners to tour the Keith Circuit. Edna Goodrich, Loie Fuller, Marie Tempest, Lily Langtry, Mrs. Leslie Carter and Phyllis Neilson Terry were a few more of the celebrities to grace the spotlight of American vaudeville. Concert and opera stars, legitimate actors and actresses no longer spurn vaudeville engagements; rather it has become the logical answer to a lull in their ordinary activities.

Public demands have made it necessary to augment motion pictures with vaudeville. This condition has resulted in several screen and variety mergers and a policy of presenting both forms of amusement at the majority of vaudeville houses. This idea seems destined, by force of popular demand, to rule, with exceptions only in the larger cities, in all variety houses, thereby combining two extremely popular theatrical factors on one programme.

(M. A. L.)

**VASSAR COLLEGE** (see 27.946d).—During the period 1910–25 the endowment of Vassar College grew from about \$1,500,000 to \$7,000,000 with 900 ac. in campus and farm. Student enrolment, formerly limited to 1,000, was increased to 1,150. The college has always maintained a full roster, admitting new students whenever vacancies occur. Some of the new students each year are admitted in order of application, provided they pass the entrance examination; but about one-third of the entering class is admitted on competitive examination. Plans call for enrolment exclusively by competitive examination after 1928. The funds available for student aid in one form or another amounted in 1926 to over \$450,000. The physical equipment of the college, exclusive of faculty residences, includes 30 buildings, seven of them dormitories, a library containing 132,000 catalogued books and a farm of 675 ac., with vegetable gardens and a model dairy.

Student self-government is in effective operation, the students themselves assuming responsibility for most of the regulations governing attendance and conduct, for the management of the Students' Building and a Club House conducted for the maids; also for all extra curriculum activities, including the providing of various money-making occupations for self-supporting students. The price for rooms and board is the same for every student. The rooms are selected by lot. There are no sororities or other clubs to which membership is not absolutely open. No fee may be charged for admission to any campus building. All these facts help to maintain the democratic spirit of which the college is justly proud.

The increased endowment mentioned includes \$3,000,000 pledged in 1921–2 for the increasing of teachers' salaries. The college in 1925 received a gift of \$550,000 by Mrs. John W. Blodgett, of Grand Rapids, Mich., for the erection and endowment of a laboratory of "euthenics," a term comprising the sciences which contribute most directly to physical efficiency. This development is in keeping with the wishes of Matthew Vassar, founder of the college, to the effect that the curriculum should provide, in addition to other studies, those related to the fullest development of the primary interests of women in relation to parenthood and the family. (B. J. \*)

**VATICAN:** see PAPACY.

**VAUGHAN WILLIAMS, RALPH** (1872– ), British musical composer, was born at Down Ampney, Glos., Oct. 12 1872. He early determined on the pursuit of music, but his development as a composer was slow. At Trinity College, Cambridge, where he became Mus. Bac. in 1894, and at the Royal College of Music, where he studied with Parry and Stanford, his work made little mark. He seemed singularly lacking in the power of clear self-expression. The revival of English folk-song, however, in which he became absorbed, unlocked his latent creative powers. *The Norfolk Rhapsodies* for orchestra (founded on folk-tunes), and the symphonic impression *In the Fen Country*, on original themes of folk-song character, show his development. Other types of distinctively national music, notably the Tudor Church composers and Purcell, strengthened his technical resources and helped to determine his own style in the direction of vigorous melodic outline, the free use of model scales, an unflinching contrapuntal texture and a high-handed attitude towards harmony. Among poets, Walt Whitman specially attracted him, and his setting of *Toward the Unknown Region*, for chorus and orchestra (Leeds Festival, 1907), made its impression through the unaffected and sincere aspiration of the music and its close contact with the poem. *A Sea Symphony* for soprano and baritone soli, choir and orchestra (Leeds Festival, 1910), with the words selected from several poems of Whitman, was the crowning achievement of this period. *A London Symphony* for orchestra only (produced at the Queen's Hall, London, 1914) is a vividly imaginative piece in which poetry is discovered in such common places of London life as the noise of traffic and the street urchin playing a mouth-organ.

During the World War he served in the R.A.M.C. and later gained a commission as a gunner. Afterwards he took up his music where he had left it. *A Pastoral Symphony for Orchestra*

(Royal Philharmonic Society, 1922) might be described as the deep breath of content which a man draws on recovering the wholesome sanity of the English country. *A Mass in G Minor* (Westminster Cathedral, 1923) is one of the noblest pieces of pure church music since Byrd's setting of the liturgical text for five voices. A choral work called an oratorio, *Sancta Civitas* (Oxford, 1926), shows the composer dwelling in a phase of mystic thought which he had already touched on in the scene for the stage from *The Pilgrim's Progress*, called *The Shepherd of the Delectable Mountains*. The ballad opera, *Hugh the Drover* (words by Harold Child), belongs to the earlier period when folklore and folk-songs were the primary inspiration of his work. As musical director of the English Folk Dance Society Vaughan Williams carried on the work which Cecil Sharp initiated. He also became conductor of the London Bach Choir and professor of composition at the Royal College of Music.

**VAZOFF, IVAN** (1850–1921), Bulgarian poet and novelist, was born at Sopot. In common with the founders of Bulgarian literature, Rakovsky, Karaveloff and Boteff, he was first inspired by the sufferings of his countrymen before the liberation. His *Trials of Bulgaria* describes the nation's struggle for freedom. A bard of the people, Vazoff's style is simple and unaffected; his *Epic Poem to the Forgotten*, celebrating the great deeds and sacrifices of the Bulgarian people, thrilled the nation, as also *Under the Thunder of Victory* (1914), *Songs of Macedonia* (1916) and *New Echo* (1917). Vazoff's most inspired poems and novels of a descriptive character are those relating to the Bulgarian countryside and village-life. He died at Sofia Sept. 22 1921.

His chief novels are: *Under the Yoke* (Eng. trans. 1894); *Svetoslav Terter* (1907), *Hadji Ahil* and *Kazalarskata Tsaritsa*; and his dramas include: *Borislaw* (1910) and *Towards the Abyss*.

**VEBLEN, THORSTEIN B.** (1857– ), American author and teacher, was born July 30 1857. He was educated at Carleton College, where he took the A.B. degree in 1880, and did post-graduate work at Johns Hopkins, Yale and Cornell Universities. He was appointed reader in political economy at the University of Chicago in 1893, becoming successively instructor and assistant professor. He was associate professor of economics at Stanford University, 1906–9, lecturer in economics at the University of Missouri in 1911–7, and lecturer in the New School for Social Research, New York City, 1918. He made contributions to the theory of economics, especially as modified by current business practices.

Among his works are *The Theory of the Leisure Class* (1899); *The Theory of Business Enterprise* (1904); *The Instinct of Workmanship* (1914); *Imperial Germany and the Industrial Revolution* (1915); *An Enquiry into the Nature of Peace and the Terms of Its Perpetuation* (1917); *The Higher Learning in America* (1918); *Vested Interests and the State of the Industrial Arts* (1919); *The Engineers and the Price System* (1921); *Absentee Ownership and Business Enterprise in Recent Times* (1923).

**VEDDER, ELIHU** (1836–1923), American artist (see 27.964), died at Rome Jan. 29 1923. His book, *Doubt and Other Things*, was published a few days before his death.

**VEJDOVSKÝ, FRANTIŠEK** (1849– ), Czech zoologist, studied in Prague, Trieste and Naples and specialised in zoology, comparative anatomy and embryology. In 1877 he qualified as a lecturer at the Prague technical institute by a work entitled *Monographie der Enchytraeiden* (1879), and in 1879 was appointed professor at the Charles University in Prague. Of his numerous works the most noteworthy are those dealing with the problem of the ripening, fertilisation, segmentation and cleavage of ovum cells, on which he became widely known as an authority. In addition to numerous articles in periodicals his most important works are: *Die Süßwasserschwämme Böhmens* (1883); *Neue Untersuchungen über die Reifung und Befruchtung* (1907). Prof. Vejdovský received many academic distinctions and was made a corresponding member of numerous native and foreign biological and zoological societies.

**VENEREAL DISEASE.**—The period from 1910–25 has been marked by the commencement of a campaign which has developed into a world-war against venereal diseases. In this work Great Britain has taken a prominent part but the campaign has also been carried on in other parts of the world.

In 1913 a royal commission under the chairmanship of Lord Sydenham was set up to inquire into "the prevalence of venereal diseases in the United Kingdom, their effects on the health of the community, and the means by which those effects can be alleviated or prevented." The royal commission reported in 1916, and their recommendations were immediately acted upon by the Local Government Board of England and Wales (now the Ministry of Health), and the public measures for combating venereal diseases in England and Wales are now as mentioned below, while in Scotland and Ireland the campaign is being conducted on the same principles.

**Legislative Action.**—1. By an Act of Parliament passed in 1917 the treatment of patients for venereal disease by others than registered medical practitioners and the sale without the prescription of a registered medical practitioner or the advertisement to the lay public of remedies for the treatment or prevention of venereal diseases are forbidden.

2. There are 193 centres chiefly in voluntary hospitals for the treatment, free of charge, of persons suffering from venereal disease.

3. Fourteen hostels exist for the care and treatment of females who are infected, and would, unless helped by shelter, become professional prostitutes.

4. Seven institutions are specially for the care of pregnant females who are infected.

5. Treatment of venereal disease is also provided in poor law institutions.

6. Arsenobenzol (salvarsan) compounds are given free of charge to medical practitioners qualified to administer these remedies.

7. Specimens from persons suspected to be suffering from venereal disease can be examined free of charge in 73 laboratories which have been approved for the purpose.

8. The work of educating the public in the dangers of venereal diseases and the importance of early and continued treatment is carried out by the British Social Hygiene Council (formerly the National Council for Combating Venereal Diseases), which receives from the Government a grant in aid of its expenses. Propagandist work is also undertaken by the county councils and county borough councils, either directly or in conjunction with the British Social Hygiene Council.

The arrangements for establishment of free treatment facilities for distribution of arsenobenzol compounds and for laboratory examinations are under the control of county councils and county borough councils, which receive from the Government 75 % of their approved expenditure on this account.

**Results Obtained.**—Some idea of the results obtained may be gathered by comparing the returns of cases seen for the first time in 1920, when the numbers were highest, with those seen for the first time in 1924, as presented hereunder:—

| Year | Syphilis | Soft<br>Chancre | Gonorr-<br>hoea | Non-ven. | Total   |
|------|----------|-----------------|-----------------|----------|---------|
| 1920 | 42,805   | 2,442           | 40,284          | 19,654   | 105,185 |
| 1924 | 22,010   | 1,098           | 31,272          | 18,842   | 73,222  |

The table discloses a substantial reduction in the number of cases of syphilis, and the figures indicate that the incidence of syphilis in the community has declined considerably. Similar results have been reported by other countries which have set up venereal-disease schemes on the principle of treating the infected. The attendance at the centres in 1920 was 1,488,514 and in 1924 had increased to 1,645,415.

**Gonorrhoea.**—No outstanding remedy has been discovered analogous to that of arsenobenzol in syphilis, but, particularly since 1914, improvements in detail have made the diagnosis and cure of gonorrhoea more certain. In diagnosis, improvements in methods of cultivating the gonococcus on artificial media have placed the surgeon on firmer ground when determining the question of cure. In treatment the practice of administering vaccines to raise the patient's resistance has become much more common. In complications of gonorrhoea, such as gonorrhoeal rheumatism and iritis, what is known as protein-shock therapy has proved useful.

The remedies employed in this form of treatment are quite varied; for example, colloidal silver or anti-typhoid vaccine injected into a vein; milk or turpentine injected into the muscles. They have the immediate effect of raising the patient's temperature and by the next day there is usually a definite improvement in the symptoms.

Another form of treatment which has been in use by a few for a number of years but is only now becoming more general is

diathermy (see ELECTRO THERAPY). The principle of its use in gonorrhoea and its complications is that the gonococcus is very sensitive to heat, being killed at temperatures which are supported with comparative ease by human tissues.

Good results have been obtained in gonorrhoea of females by this method, but undoubtedly its most pleasing effects are in epididymitis and in gonorrhoeal rheumatism in men. In gonorrhoeal rheumatism and iritis the reservoir from which the joints and eyes are continually being infected is commonly in the prostate and the seminal vesicles, both situated at the base of the bladder. The current is applied by means of an electrode placed in the rectum and is increased in strength until the patient feels the part becoming uncomfortably hot.

**Soft Chancre or Chancroid.**—The figures showing the new cases which have been seen at treatment centres indicate that chancroid is not now very prevalent in Great Britain. The treatment is now more conservative than formerly. The chancroid is viewed as possibly harbouring also the germs of syphilis, and with the object of avoiding any action which may prejudice the microscopical search for the more severe disease, the surgeon withholds for as long as possible the application of antiseptics.

When a bubo forms in the groin, a comparatively rare event under modern practice, it is more usual now to attempt to secure resolution by protein-shock therapy (see GONORRHOEA) and by aspiration of the abscess followed by injection into the abscess cavity of some drug which will lead to the destruction of the germs.

**Syphilis.**—Improvements in methods of detecting the germ of the disease, *Spirochaeta pallida*, under the microscope, viz., by dark-ground illumination, have made it possible to diagnose the disease very rapidly on the day it makes its first appearance.

The Wassermann, or the Bordet-Wassermann, test has been modified considerably in its details and is generally more delicate than formerly.

In 1918 Sachs and Georgi published the details of a new test which, either in its original or a modified form is now being practised very extensively. It depends on the fact that, if a suitably diluted extract of heart muscle, with some cholesterol, is incubated at 37° C. for a number of hours with the blood serum of a syphilitic person, small flocculi appear in the previously clear or very slightly turbid mixture. In Great Britain, Dreyer and Ward have devised a test which depends on the same principles but is much more precise in technique and expresses the strength of the reaction numerically. In the U.S.A., Kahn has produced a modification which is extremely easy to carry out. So far these flocculation tests have not reached the degree of perfection which would justify their substitution for the Wassermann test, but often they give positive results when the original gives negative and vice versa, so that they supplement usefully the Wassermann test. The examination of the fluid in the spinal canal is now carried out much more frequently than formerly, and a patient is not regarded as cured unless all tests of this cerebro-spinal fluid have given negative results. As to all these tests it must be emphasised that negative reactions to all of them do not prove the absence of syphilis. It is therefore customary to pursue the treatment far beyond the stage of the first negative reactions.

Great strides have been made in treatment since 1910 when Ehrlich introduced dioxy-diamino-arsenobenzol dihydrochloride, commonly known as "606" or salvarsan, as a remedy for syphilis. The effect of a single dose of this remedy is usually to cause the spirochaetes to disappear from the discharge of syphilitic sores in 24 hours and syphilitic lesions heal with a rapidity which was a source of great wonder to those who had toiled in the treatment of syphilis with the help of only mercury and preparations of iodine.

The original preparation has largely been supplanted by a compound introduced by Ehrlich in 1912 under the name of neosalvarsan or "914," which is much more convenient to use and less disturbing to the patient than was the original preparation. These advantages are somewhat offset by a lower therapeutic activity of the newer preparation. Combinations of arsenobenzol with silver and with zinc are also used. The manufacture of arsenobenzol preparations spread during the War into the hands of a number of firms each of which has attached to the same chemical compounds trade names of their own to an extent which may be somewhat bewildering to the uninitiated.

Every arsenobenzol compound is made in batches each of which receives a distinctive mark and must pass a certain test of toxicity and of therapeutic activity before it can be issued to the public. The testing in Great Britain is carried out by the Medical Research Council. Experience has shown that, although the

arsenobenzol preparations act very promptly, a number of injections in successive courses must be administered to secure eradication of syphilis and that it is advisable to supplement them by administering another metallic compound.

Arsenobenzol will not penetrate into the nerve tissue of the brain, and this limitation has led to the introduction of an arsenical preparation of another order, viz.: trypanamide or *n*-phenyl glycine-amido-*p*-arsonic acid into the therapy of locomotor ataxy and general paresis. The results show generally that trypanamide is valuable for this purpose.

In 1920 Sazerac and Levaditi showed that tartro-bismuthate of potassium and sodium is more powerful than mercury in destroying the spirochaetes of syphilis, and a large number of bismuth preparations have been placed on the market since it was found that it is the metal rather than the compound which matters in the therapeutic action. Generally it can be said that bismuth injections effect more towards the cure of syphilis than do mercurial and that preparations of bismuth can be used which cause less discomfort than do any mercurial.

Bismuth is useless for the cure of syphilis if given by the mouth and its injection into veins is practised very little on account of its greater toxicity when administered by this route. Bismuth is generally considered to be an adjuvant rather than a substitute for arsenobenzol treatment. It is retained in the tissues for long after a series of injections has been given, and it thus prolongs the anti-syphilitic effect after all the arsenobenzol has been excreted.

The powerful effect of the arsenobenzol and bismuth compounds on the germ of syphilis has led to a number of experiments to determine whether or not they prevent the development of syphilis after inoculation.

There is strong evidence to the effect that a few arsenobenzol injections given after contamination with syphilitic virus does protect against the disease. Kolle has produced experimental evidence tending to show that the injection of bismuth carbonate protects against infection resulting from inoculation with syphilitic virus so long as the compound remains in the muscles. Rabbits treated thus proved resistant to inoculation with syphilitic material for as long as 109 days after injection of the bismuth.

The disadvantage of injections as a method of preventing syphilis after venereal risk led Levaditi to try an arsenical compound called stovarsol or acetyl-oxyamino-phenyl arsenic acid, which is administered by the mouth. There is good evidence that the ingestion of stovarsol in suitable doses prevents infection, but considerably more work on the subject will be necessary before stovarsol can safely be given to the public as a prophylactic against syphilis.

*Treatment of General Paralysis of the Insane.*—A great advance has been made in the treatment of a form of syphilis which is acknowledged to be the most incurable of all, namely general paralysis of the insane. This disease is one which has almost always ended fatally, defying the most intensive treatment by anti-syphilitic remedies. Its course is marked by remissions of varying length, during which the patient may appear to have recovered. It has been known for a century or more that an intercurrent infection accompanied by fever often results in a long remission, and this knowledge has led Wagner von Jauregg and his colleagues in Vienna since 1887 to inoculate patients with a variety of substances designed to make their temperatures rise. The best of all the agents has proved to be the parasite of benign tertian malaria and since its introduction in 1919 the method has been tested all over the world. The results have been very encouraging. The inoculation is by injection of malarial blood or by the bites of infected mosquitoes, and eight to twelve attacks of fever are allowed before quinine is given.

**VENEZUELA** (*see* 27.988).—A republic on the north coast of South America. Its area is 398,594 sq. m. and the estimated population on Jan. 1 1925 was 2,563,334. The population of Caracas, the capital, in 1920 was 92,212; Maracaibo, 46,706; Valencia, 29,466. Venezuela acquired membership in the League of Nations in 1920.

Venezuela's constitution of 1922 declared that the republic was composed of 20 states, 2 territories, a Federal district and certain islands in the sea of the Antilles. It provided that the Federal district was to be organised by a special law and should be composed of the city of Caracas with the neighbouring parishes as well as the department of Vargas. It is further stipulated that the territories of Amazonas and Delta-Amacuro, which were to be organised by a special law, might become states when they fulfilled certain conditions, as when they had at least as many inhabitants as the quota required by the constitution for the election of one deputy to Congress.

## I. POLITICAL HISTORY

*Constitution.*—On May 18 1914 a Congress of Deputies from the Venezuelan states adopted a new constitution for their union. That constitution declared that the Venezuelan states reciprocally recognised their autonomy and equality, and that they retained all sovereignty not delegated to the central Govt. by the constitution. The states agreed to promulgate constitutions that would harmonise with the fundamental law, and agreed to see that the national constitution, laws and orders were obeyed. Early in June assemblies at the capitals of the respective states ratified the new form of government, which came into force on June 13 1914. This constitution conferred male suffrage on all citizens 21 years of age or over. Foreigners who took part in political controversies (*contendidas*) could be arrested, confined or expelled by order of the president. Executive power was vested in a president and a Cabinet of ministers appointed by him. The president was to be elected for a seven-year term by vote of Congress. Among the extensive powers vested in the chief executive were the following: to administer the Federal district and the two Federal territories; to issue decrees and regulations for the better execution of the laws; to negotiate loans as provided by Congress; to grant certificates of naturalisation; to appoint national officials whose appointment was not otherwise provided for; to convoke an extraordinary session of Congress; to declare war when authorised by Congress; to negotiate treaties with foreign nations; and to proclaim martial law throughout the republic.

Legislative authority was granted to a Congress composed of a Senate and a Chamber of Deputies. The Senate was to be composed of two Senators from each State chosen by its Legislative Assembly for three years. The Chamber of Deputies was to be composed of members chosen from every State and from the Federal district by popular vote for three years at the ratio of one deputy to every 35,000 inhabitants. Congress was to meet annually on April 19 at the capital for a session of 70 days. Judicial authority was vested in a Supreme Court designated the *Corte Federal y de Casación* and in other tribunals established by law. The Federal Supreme Court was to be composed of seven judges who were to be elected by Congress for a term of seven years. Clauses defining the powers of this court provided that it should take cognizance of accusations against the president and other high officials. It was given jurisdiction over cases involving claims against the nation, cases relating to foreign diplomatic agents in Venezuela, cases arising from contracts made by the president and cases involving conflicts between laws or decrees, State or Federal. These provisions were retained in the constitution of 1922.

*Events from 1908.*—When in Nov. 1908 President Castro left Venezuela to visit Europe, the first vice-president, Juan Vicente Gómez was given the presidential power. In decrees of Nov. 23 1908 Gómez appointed a general secretary and confirmed the existing Cabinet appointments. On May 3 1909 he issued a decree announcing that he was exercising the powers of president of Venezuela, and after suppressing opposition to his

rule, he was acclaimed President Dec. 19 1909. Under the constitution of 1909, on Aug. 27 1910 Congress elected Gómez constitutional President for four years. In June and July 1911 Venezuela celebrated the centenary of her declaration of independence. During the rule of Gómez diplomatic relations with foreign nations that had been ruptured were resumed, and Venezuela undertook to pay those obligations to foreign nations upon which payments had lapsed. Upon an attempt of ex-President Castro to regain power, President Gómez issued a proclamation on Aug. 3 1913 announcing that he was leaving the capital to undertake a campaign for the restoration of public order. On Aug. 4 he delegated his authority to José Gil Fortoul, president of the council of government. On Jan. 1 1914 he re-entered Caracas at the head of his army and re-assumed the powers of President.

According to the constitution the term of office of President Gómez ended on April 19 1914. Upon that day a Congress of Deputies from the Venezuelan states adopted a provisional constitutional statute for the Union, which declared that all laws not inconsistent therewith should remain in force. It further provided that this Congress should elect a commander-in-chief of the national army at the same time that it elected a provisional president of the republic. Congress was also to frame a new pact of union for Venezuela, which should be submitted to the assemblies of the states for approval. The period of provisional rule should last until the new constitution had been ratified by the states and until the constitutional functionaries had taken their posts. On the same day Congress elected Victorino Márquez Bustillos, who had been Minister of War and the Navy, provisional President, and by a decree of the same day Bustillos appointed his ministers of state. Congress elected General Gómez commander-in-chief of the national army.

On May 3 1915 the Congress chosen under the constitution of 1914 unanimously elected Gen. Gómez President of the republic for the term ending April 19 1922, but the president-elect did not assume the presidency. The provisional president continued to exercise authority while General Gómez remained commander-in-chief of the army with the title president-elect of the republic. In May 1922 Gen. Juan Vicente Gómez was unanimously re-elected President of Venezuela. On June 19 a new constitution was promulgated which made some slight but important changes in the constitution of 1914. Articles 137 and 138 of that fundamental law, which stipulated that the provisional president and the vice-presidents of the republic should hold their offices until the new magistrates were inaugurated and that the commander of the national army should exercise his functions until the inauguration of the constitutional president, were omitted from the constitution of 1922. This constitution further provided that in case the president should be permanently disabled, he should be succeeded by the ranking vice-president. On June 24 following, General Gómez relieved Márquez Bustillos of the nominal authority which the latter had exercised since 1914, and assumed the powers of president for the term terminating in 1929. On July 1 1923 the president's brother, Gen. Juan C. Gómez, first vice-president of the republic, was murdered in Miraflores Palace. In Oct. 1923 the Venezuelan Minister of Foreign Affairs declared that Mexico had severed diplomatic relations with his country alleging that Venezuela had expelled a Mexican theatrical company. In April 1924 the Congress of Venezuela assembled at Caracas.

*Boundary Disputes.*—The boundary dispute between Colombia and Venezuela, which had been submitted to the arbitration of the Swiss Federal Council, was decided in March 1922 in favour of the Colombian contention; namely, that she was entitled to take possession of such portions of the territory in dispute as had been adjudged to her in accordance with the decision of the King of Spain in 1891. This award also decided that both Colombia and Venezuela might proceed to occupy sections of territory bounded by natural frontiers which had been adjudged to them by the action of mixed commissions. The boundary line through the contested territory, so far as it had not been definitely settled, was subsequently determined

by Swiss experts who employed aeroplanes and cameras to map out the unexplored areas involved.

*Defence.*—In 1912 Venezuela purchased a small vessel from the United States, which was made the flagship of the navy. In 1925 the Venezuelan Navy was composed of three gunboats and a training ship with a personnel of a few hundred men. The standing army was composed of some 9,000 infantry, artillery and cavalry. In addition there was a reserve estimated to consist of about 100,000 men. By a law published in June 1919 military service was made compulsory for all adult male citizens with certain exceptions. Service in the army or navy for two years in peace-time and during war at the president's pleasure was made compulsory with relegation to the reserve until the age of 45. A decree of April 17 1920 provided for a military aviation school at Maracay.

*Education.*—According to the law of 1921 primary education is free and compulsory between 7 and 14 years. Secondary education comprises two courses; one of general study occupying four years, and one of professional study occupying two years. Normal training is furnished by two institutions at Caracas. Among the special schools are schools of commerce and modern languages at the capital and other important cities, besides two schools of industrial arts and trades. Higher education is afforded by the Central University of Venezuela at Caracas where instruction is given in medical science, political science, ecclesiastical science, mathematics and physical science. There was a similar institution, the University of the Andes, at Mérida. Physical education is compulsory in all schools up to the age of 21. According to the report of the Minister of Public Instruction for 1925, the attendance at educational institutions of Venezuela for 1924 was as follows: Primary schools, 352,337; secondary schools, 9,203; normal schools, 3,664; special schools, 14,762; higher institutions, 4,304; making a total of 384,270. Expenditure on education for 1924-5 was 4,648,345 bolívares.

## II. FINANCIAL AND ECONOMIC HISTORY

*Finance.*—Since 1909 the financial condition of Venezuela has steadily improved. The new law concerning public credit which came into force on June 15 1923, introduced reforms in the administration of Venezuela's finances. Among other provisions it stipulated that certificates of the internal national consolidated debt which were received by the Treasury should be burned. The following details of the public debt of Venezuela in bolívares as outstanding on Dec. 31 1923, are taken from the report of the Minister of Finance for 1924:—

### External debt:

|                                         |               |
|-----------------------------------------|---------------|
| National three per cent diplomatic debt | 9,169,490.26  |
| Three per cent diplomatic debt of 1905  | 58,948,145    |
| Total                                   | 68,117,635.26 |

### Internal debt:

|                                                    |               |
|----------------------------------------------------|---------------|
| National internal three per cent consolidated debt | 42,647,277.93 |
| Three per cent inscribed debt                      | 2,098,652.50  |
| Total                                              | 44,745,930.43 |

The total indebtedness of the Venezuelan Govt. on Dec. 31 1923 thus amounted to 112,863,565.69. The budget for 1924-5 estimated expenditure at 63,354,500 bolívares. Over one-fourth of this amount was allotted to the Ministry of Finance and Public Credit, one-fifth was assigned to the Ministry of War and the Navy, while more than one-sixth was given to the Ministry of the interior. In the budget the receipts of that year were estimated at 66,167,000 bolívares, an increase of 3,322,000 over those for 1923-4. In his message to Congress on April 25 1925 President Gómez stated that the total national debt had been reduced to 99,445,723 bolívares by Jan. 1 1925, and that on Dec. 31 1924 there was in the treasury a surplus of 64,692,080.46 bolívares. The bolívar was relatively stable during the World War. The exchange value of the U.S. dollar measured in bolívares at different dates was as follows: July 1914, 5.30; April 1917, 5.14; April 1918, 4.32; Jan. 1919, 4.25; Dec. 1919, 5.16; Feb. 1920, 5.18; Sept. 1923, 5.43; Jan. 1924, 5.25; and Oct. 1924, 5.18. On Dec. 31 1923 there were in circulation in Venezuela 35,129,695 bolívares of bank-notes, while the gold reserve aggregated 55,149,749. Of the paper currency 25,293,340 bolívares was supplied by the *Banco de Venezuela*. A shortage of silver in the circulating media has been met under the provisions of a law of 1918 by the minting of new silver coins.

*Industry and Commerce.*—Agriculture and cotton raising were the chief sources of national wealth, and for 1924 the Venezuelan oil-fields showed a successful yield; in 1924 petroleum production was 1,330,912 metric tons. Exports of coffee had risen from 52,088,000 kilos in 1922 to 38,436,000 during the first six months of 1924. According to official reports, the total foreign trade of Venezuela in 1923 amounted to 309,396,512 bolívares (1 bolívar = \$ .19295). The imports aggregated 152,692,315 while the exports came to 156,704,197 bolívares. The countries furnishing the largest amounts of the imports were in order: United States, Great Britain, Germany, France, the Netherlands, Spain and Italy, while the countries taking the largest amounts of exports were the Netherlands, United States,

Spain, France, Great Britain and Germany. In 1923 the chief exports were valued as follows in bolívares: coffee, 68,945,726; petroleum, 27,321,920; cacao, 23,817,102; sugar, 5,359,128; balata, 4,084,588; hides, 3,515,550; cattle, 1,901,455; gold, 1,300,000; asphalt, 1,332,940; heron plumes, 1,017,735; and pearls, 740,880.

**Communications.**—In 1924 thirteen railways of importance were operating in Venezuela. The total length was 645 m., and the construction of new, short lines was contemplated. The construction, improvement and repair of Venezuelan roads continued to receive much attention from the Government. Decrees have been issued providing especially for the construction of a Great Western Highway to connect Caracas with the Colombian border near Cristóbal, and for the construction of a Great Eastern Highway to connect Caracas with Venezuelan Guiana. Wireless communication with Trinidad is maintained through the Caracas station, which has been improved. Communication with Puerto Rico has been maintained through the Maquetia station. The Puerto Cabello and Maracaibo stations have ceased operations.

**VENICE**, Italy (*see* 27.995), had a population of 171,615 in 1921. An exact reproduction of the famous campanile, which collapsed in 1902, was finished in 1912; and the Loggetta dei Cavalieri, which was crushed in its fall, has also been repaired. The city suffered from aerial bombardments in the World War; 620 bombs were dropped, but the damage to its famous buildings and monuments, though considerable, was less than had been feared. The church of Santa Maria Formosa was practically destroyed, but has been restored. The bronze horses of St. Mark's were removed to Rome for safety. After the War various pictures were returned to the Academia by Austria. In 1920 the Procuratie Nuove, which was first the home of the procurators of St. Mark's and then a Napoleonic palace, was given to Venice by the Italian royal family, and now houses the civic museum of art and history. In 1925 the foundation stone of a votive temple was laid on the Lido by the Venetian patriarch in fulfilment of a vow made in 1917 that if the city was saved from falling into the hands of the enemy a church would be built in honour of the Virgin. A brick from St. Peter's and a piece of rock from the Grotto at Lourdes have been incorporated in the foundations.

**Improvements to the Port.**—In 1917 plans were made for a new port for Venice on the mainland, south of the railway line to Padua; in 1922 the canal of approach was opened by King Victor Emmanuel, and named in his honour, and in 1924 the construction of the main works was begun. The port, when finished, will cover twice the area of Venice itself, and will consist of parallel moles 3,000 ft. long with docks of 600 to 800 ft. between. Two moles will be built at first, with isolated jetties on the canal for oil ships. With the existing docks in Venice this will give the port a capacity of 10,000,000 to 12,000,000 tons a year. It is hoped that the industrial area, which is being built behind the docks, will create a considerable volume of trade. Behind the industrial area again a garden suburb to house 30,000 is being brought into existence by the municipality. Special customs facilities have been granted for the encouragement of trade in the new port, which, it is thought, will in no way spoil the beauty of Venice.

**VENISELOS, ELEUTHERIOS** (1864– ), Greek statesman, was born in Crete Aug. 23 1864 of a family which had emigrated from Greece in 1770. Having been educated in the schools of Syra and Athens and having taken a degree in the University of Athens at the age of 23, the future statesman practised law in Crete. But following his father's example and like most members of his profession in the Near East, he soon became a politician, and in the insurrection of 1889 was compelled to flee from the island. After his return and the re-establishment of tranquillity, Veniselos was elected a member of the Cretan Assembly,

and in 1897 came into prominence as one of the leaders of the Cretan uprising; it was he who received the British, French and Italian admirals when they came to negotiate a settlement between the insurgents and the Turks early in Feb. of that year.

In Dec. 1898 Prince George of Greece landed in Crete as the High Commissioner of the Great Powers, and a few months later Veniselos became head of the Island Executive. But he soon found himself at variance with the Prince's autocracy, and in 1904 a complete rupture occurred. Subsequently the Veniselists were defeated at the polls, but the Cretan leader organised a revolt, which greatly increased the unpopularity of the High Commissioner among a people whom he was misruling. In Sept. 1906 the Prince left the island, his place being taken by M. Alex. Zaimis, who was appointed not by the Powers, but by the King of Greece. From that time until 1909 Veniselos was sometimes Chief of the Cretan Govt. and sometimes Leader of the Opposition. But whilst the Cretans often came into sharp conflict with the Protecting Powers, Veniselos's wisdom and moderation were responsible for the generally friendly relations which existed, and his far-sightedness, particularly after the departure of M. Zaimis in Oct. 1908, and during the crisis of 1909, facilitated the union of Crete with Greece, which ultimately took place as a result of the first Balkan War.

In 1909 the military league headed a bloodless revolution against political corruption and court favouritism in Greece and invited Veniselos to come to Athens. He persuaded King George and the League that the best way out of a dangerous situation would be the revision of the Constitution by a National Assembly. Elections were held in Aug. 1910, and Veniselos, who had remained technically a Greek citizen during his Cretan political life, took his seat at Athens for the first time. The Chamber having been opened in Sept., a month later Veniselos became Prime Minister. Indeed, such was his power at this time that, although faced by parliamentary difficulties, he was in a position to have brought about the expulsion of the royal family and the establishment of any régime which he thought desirable.

But the Cretan statesman was bent upon reforms by pacific means, and realising that a fundamental change would be contrary to the interests of the country, he loyally decided to work with the King and his successors. The Constitution was successfully revised in 1911, reforms in the public services were introduced, and the reorganisation of the army and of the navy were respectively placed in the hands of French and British Missions. In the spring of 1912 Veniselos was returned to power as the leader of an overwhelming majority in an ordinary Chamber which then replaced the Revisionary Assembly. By that time, too, the Prime Minister was busily occupied with the formation of the Balkan League, and on May 29 1912 the Greco-Bulgarian Treaty was signed. Other Greek statesmen had worked for a like object, and the circumstances may have been more favourable than heretofore, but it is certain that the Balkan League would never have come into being except for Veniselos's foresight in accepting the necessity for taking Greece into an alliance which had already been made between Bulgaria and Serbia.

Whilst the Balkan Wars and Veniselos's diplomacy led to an unexpected Hellenic expansion, the assassination of King George at Salonika on March 18 1913 removed a man who had always been in favour of moderation, and placed upon the throne his son Constantine, who had not forgiven, and who never really forgave, Veniselos for his attitude towards Prince George in Crete. When the World War broke out, therefore, the position of Greece was greatly complicated by the facts that she was bound to Serbia by a Treaty signed in the summer of 1913; that from the first Veniselos was an ardent supporter of the Allied cause; and that the King was in sympathy with the Central Powers. Before the entry of Turkey into the War, Veniselos openly favoured Hellenic assistance for the Entente in case of that entry, and early in 1915 the Prime Minister advocated concessions to Bulgaria, Greek support for Serbia, and Greek co-operation at the Dardanelles in exchange for the promise of important future compensations in Western Asia Minor. But.

though he appears originally to have approved of the idea, the King vetoed Veniselos' decision to accept this offer, and he was forced to resign, though he possessed a strong majority in the Chamber. In the election which followed in June the Veniselist party secured the return of 190 deputies out of a total of 316, of which the Chamber was then composed.

In spite of this, and with the excuse of the King's illness, Veniselos was not recalled to power until after the meeting of the Chamber in Aug. and by that time the situation had become seriously modified. The entry of Italy into the War, helpful as it was, complicated the position of Greece, the attack upon the Dardanelles had proved a failure, and developments in the Balkans were reacting seriously against the Allied cause. Serbia managed more or less to hold her own during the first year of the War, but now a fresh Austrian invasion was imminent, and Bulgaria, whose support the Allies had failed to gain, was preparing to throw in her lot with the Central Powers. In equity, if not in actual law, the entry of Bulgaria brought into operation the Greco-Serbian Treaty of 1913 and necessitated the support of Serbia by Greece. Bulgaria mobilised on Sept. 19 1915, and a few days later Veniselos had an audience with the King, at which His Majesty reluctantly consented to a Greek mobilisation and to a Greek request that the Allies should furnish an army of 150,000 men to take the place of the contingent which ought to have been supplied by Serbia under the Treaty.

Immediately after the original Allied landing at Salonika on Oct. 1 Veniselos secured a vote of confidence during an historic and stormy meeting of the Chamber, when he declared that if in aiding Serbia Greece was brought into contact with Germany she would act as her honour demanded. In spite of a formal protest against the Allied passage through Hellenic territory, this speech led to the second dismissal of Veniselos and to the open and final rupture between that statesman and the King, who, it would seem, always intended to withdraw his consent to an Hellenic entry into the War. Zaimis, the new Prime Minister, maintained his position for a month as a result of the patriotism of Veniselos, his friend from Cretan times, but, with the accession of Skouloudis to power, on Nov. 6 the Chamber was dissolved and a new election ordered for Dec. 19. As a protest against what was the King's infringement of the spirit, if not the letter, of the Constitution, Veniselos called upon his party to abstain from the polls, and therefore, whilst M. Gounaris secured an overwhelming majority for his policy of neutrality, the fact that M. Veniselos was able to prevent a large proportion of the voters from taking any part in the election proved the then existing strength of his party.

Veniselos spent that winter and spring (1915-6) in endeavouring to compel the King to change his point of view. But the surrender of Eastern Macedonia to the Bulgarians in the summer of 1916 and the delay in the success of the Allied Campaign at Salonika had strengthened the position of Constantine, and on Sept. 25 1916 Veniselos, together with his principal supporters, sailed for Crete, whence he sent out proclamations calling upon all true patriots to flock to the Standard of the Entente. Proceeding thence to Salonika, early in Oct., he founded a Provisional Govt., which was recognised about two months later by Great Britain and France, though not by Italy. A call for volunteers was responded to by the inhabitants of those parts of Greece not in Constantinist hands, and thousands of volunteers were soon gathered at Salonika, but the Royalist Govt. countered this and other developments by causing a solemn anathema to be pronounced against Veniselos by the Archbishop of Athens.

After the dethronement and enforced departure of King Constantine, Veniselos returned to Athens on June 26 1917, and took over the Government of the whole country. The June 15 Chamber was convoked, a general mobilisation was ordered, and Greece formally entered the theatre of hostilities upon the Allied side. But the removal of the King, the successes of the Central Powers, particularly in the Balkans, and an increased Greek desire for neutrality, backed up by German propaganda, were responsible for a great diminution of the Prime Minister's popularity. Thus, whereas the entry of Greece into the War mate-

rially favoured the Allied position at Salonika, and whereas Hellenic contingents co-operated in that area, the officers and functionaries whom it was necessary to retire on account of their political views formed a dangerous element in an opposition which became ever more and more active.

Between the Armistice of Nov. 1918 and his fall two years later, Veniselos and his colleagues, who represented Greece at the Peace Conference, were almost continuously absent in Paris and in London and, during this period, it appeared that the widespread influence of the Premier would secure for his country a success to which even her most ardent admirers had never even aspired. About the end of April 1919 the Greeks were permitted, or encouraged, to land at Smyrna; a year later the Conference of San Remo promised large areas to Greece, and the Treaty of Sèvres (Aug. 10 1920) coupled with the earlier Treaty of Neuilly (Nov. 27 1919) seemed destined to promote that country from a position of secondary Balkan importance to one of international significance. During this period, too, the Hellenic representative won such admiration and played so brilliant a part that he became a leading figure in the counsels of the Allies. Nevertheless, at a moment when his triumph appeared to be complete, and when he might have been expected to be a greater hero at home than abroad, an attempt was made upon his life at a Paris station (Aug. 1920), and three months later (Nov. 14) he received a crushing defeat at the hands of the Greek electorate for whom he had worked so hard.

Opinions have been, and are, widely divided as to the reasons for Veniselos's political downfall. It has been attributed to the unpopularity of the war in Asia Minor and to the consequent continued mobilisation, and it has been ascribed to a determination on the part of the people to regain what they called their liberty. Each of these factors played its part, but the decision was influenced primarily not by the foreign but by the broader aspects of the home situation. Thus the facts that Veniselos had been maintained at Salonika, that he was brought back to Athens in 1917, and that he was kept in power there largely by foreign support, were resented by the people. Moreover the re-assembly and particularly the prolongation of the Chamber of 1915, the maintenance of martial law, the bad administration carried on by the subordinates of the Premier while he was abroad, and the formation of and injustices practised by the "Corps de la Sûreté" were responsible for widespread ill-feeling. Furthermore, the continued absence of the Premier and the unreliable information then supplied to him caused him to lose touch with the electoral atmosphere, and gave him a confidence which was entirely unjustified. And, lastly, there was the popularity of Constantine, gained in the Balkan Wars and greatly increased by his enforced departure from Athens in 1917. This was always a matter of fundamental significance, but after the unexpected death of the young King Alexander, as a result of a monkey's bite, immediately before the election, the dynastic question, open mention of which had previously been prohibited, was brought into the forefront of the political struggle and, in what then became the direct issue between Constantine and Veniselos, the King won an overwhelming victory.

From the arrival of the King in Athens on Dec. 20 1920, until his final abdication and second departure on Sept. 30 1922, Veniselos took no official part in Greek affairs, though he continued to use his international influence in order to endeavour to mitigate the results of the Asiatic disaster, the seeds of which he had sown by his own policy. After the revolution (Sept. 1922), however, Veniselos for a time undertook the representation of Greece in Western Europe, and in that capacity he voiced the interests of his country during the long-drawn-out Conference of Lausanne which culminated in the peace signed with Turkey on July 24 1923. In the following Dec., when the publication of that document and various other events had aggravated the existing internal dissension and when the election (Dec. 16) had again given his party a majority, Veniselos was persuaded to return to Athens, where he arrived on Jan. 4 1924. King George was already then on leave of absence, Veniselos was Prime Minister from Jan. 11 till Feb. 4, when he resigned on the advice

of his physician, and a great struggle centred around the future constitutional system. Venizelos favoured a Republic, should a plebiscite support its establishment, and about a fortnight after his departure from Athens on March 10, this alternative was declared to have been adopted by the Chamber, which secured a mandate for its policy at a plebiscite held on April 13.

Venizelos, who spent the greater part of his leisure from 1921-6 in France, was left a widower with two sons (Kyriakos b. 1893 and Sophocles b. 1895) in 1895. On Sept. 15 1921 he married Miss Helena Schilizzi, heiress of a Greek Chiot family established in England.

**VENTILATING:** see HEATING AND VENTILATING.

**VERDUN, BATTLES OF.**—The invader of France coming from the east is confronted by a series of ridges between the Moselle and Paris. The second of these ridges is formed by the historic escarpment 400 metres in height, above the Meuse and called the Heights of the Meuse. Here is placed the fortress of Verdun, one of the main barriers on the road to Paris. The reduction of this position was one of the main aims of the Germans, especially after their failure to break through in the early months of the War. The following account of their efforts is presented in four sections, entitled respectively: I. Verdun before 1916; II. The First Battle, Feb. 1916; III. The Second Phase, March-Sept. 1916; and IV. Verdun Set Free.

#### I. VERDUN BEFORE 1916

In order that the strategic importance of Verdun may be fully appreciated, its position in the general French defensive scheme must be briefly described.

*History of the Fortress.*—After the war of 1870 Gen. Séré de Rivières, who was entrusted with the task of organising the frontier defences, constructed a protective curtain stretching from Verdun on the north to Toul on the south. Fortresses guarded the routes between these two places. The forts at Génicourt and Troyon covered the bridges of Dieuc and Lacroix. The battery at Paroches dominated the pass at Spada. The fort at the camp of the Romans dominated the road to St. Mihiel. Further south the forts at Liouville, Gironville and Jouy linked up with Toul. On this rampart of the Heights of the Meuse Verdun formed the northern muzzle, opposite the fortified camp at Metz some 40 m. away. The railway from Paris to Metz passes within the precincts of the fortress by the Tannes tunnel. The fortress was planned so as to form the principal line of resistance towards the north—on a cross ridge on which were the forts of Froide Terre, Douaumont, and Harcourt. On the east, on a line following the crest of the cliffs, were the forts of Vaux, la Laufée and Moulainville. The line then turned south on a cross ridge, the ridge of Rozellier, east of the Meuse along the Dugny and Landrecourt ridges on the west. The line then closed on the west and north on the ridges of the left bank by the forts Regret, Sartelles, Choisel and Bois-Bourrus. A second line of defence on the right bank, behind the first, was flanked by the fortifications at Belleville, Saint Michel, Souville and Belrupt. The core of the position consisted of an old fortified enclosure of Vauban's time and a citadel dating back to Henry II. Galleries hewn out of the rocky foundation of the citadel, with workshops, bakeries, stores of food, water pumps and barracks formed a subterranean city safe against bombardment.

*Verdun in 1914.*—At the beginning of the War the fortress was an independent command. After the battle of the Frontiers the III. Army in retreat based its right upon it and, pivoting round it, finally faced west on the Crown Prince's flank. The latter then sought to turn it by a southerly move along the

valley of the Ornain, but on the morning of Sept. 13 1914 was obliged to retreat by the defeat of the German armies before Paris. The French lines were then established 10 km. north of Verdun and the point was quiet for nearly 18 months. At the southeast of Verdun where the Heights of the Meuse slope east to the plain of Woëvre, a stiff but indecisive fight took place in the spring of 1915 for the observatory of Les Eparges. French and Germans remained face to face along the crest. Further south, in the area of St. Mihiel, by a surprise attack on Sept. 20 1914 the Bavarians penetrated to the camp of the Romans and gained a foothold on the left bank of the Meuse in the barracks of Chauvencourt. The French III. Army on one side and the I. Army on the other, checked the Bavarian success by operating on their flanks. The Bavarians stabilised their position in the woods of Chevaliers and Mouilly and to the south in the woods of Ailly. The German lines remained huddled up opposite St. Mihiel. West of Verdun the Crown Prince attempted to reach the Argonne in the direction of Varennes and forced the French lines back to the edge of Boureuilles and Vauquois. The Verdun-Boureuilles line had the grave defect of exposing the main supply line for Verdun to enemy fire from Aubréville.

*Status of the Fortress Changed.*—The autonomy of the great fortresses was cancelled on Aug. 5 1915 in order to make their garrisons and equipment available for the armies in the field. Dunkirk, Verdun and Belfort, the three great fortresses on the area of battle, became fortified regions linked up with the armies. The fortified region of Verdun (R.F.V.) was placed under Gen. Herr, who ranked as an army commander. His headquarters were at Dugny. The R.F.V. was at first part of the group of Armies of the East, but on Feb. 1 1916 was attached to the group of Armies of the Centre—then commanded by Gen. Langle de Cary whose headquarters were at Avize. On Feb. 10 1916 Gen. Herr had available seven divisions with one in reserve, and two territorial brigades. On the left hand, the 29th and 67th Div. formed the Bozelais group. On the right bank the XXX. Corps, with two divisions (72nd and 51st) was on the heights. The 14th Div. with the territorial brigades was to the east in the plain of Woëvre. The II. Corps was in support from Fromezey to Paroches. The 37th and 48th Divs. formed the reserve. These dispositions were laid down by the Instructions of Aug. 9 1915. They were entirely defensive in nature and sought to secure the front between the Army of Humbert on the left and the Army of Roques on the right.

*Germany Selects Verdun for Attack.*—About Christmas 1915 Gen. von Falkenhayn submitted to the German Emperor a report setting forth the views of the German Staff as to the campaign of 1916. The report urged that France had reached the limits of exhaustion. Russia was powerless, Serbia destroyed, Italy deceived, though all were sustained by the will of Britain who was fighting against Germany as she had fought against Napoleon. Unfortunately it was not easy to reach Britain effectively either in her distant possessions by operations which could never be decisive, or on her own soil, or on the Continent. In Flanders, no attack could be made before the middle of spring. The ground was too difficult. Between Arras and the Somme—on Allenby's front—an offensive would take 30 divisions. Germany could gather only 26 divisions, to be used all together, and this would expose dangerous points on the front. It was impossible to attack Britain directly. She would be defeated if the Allied armies on the Continent were broken.

Where, then, was this to be done. Defeat of Italy would have little effect on England. Operations against Russia could not begin till April and then only towards the Ukraine where communications were lacking and a flank would be exposed to Rumania. The only possible line of attack was against France. It was not necessary to attack or break through in force, which would be costly and stood condemned in the light of the recent failure in Champagne. Behind, but close to, the French front were positions of such importance that they would have to be held to the last man. Operations on a limited scale would not involve very large forces and Germany had reserves enough to meet all emergencies. This reasoning led to the battle of Verdun.

The German Command sought to force the French to accept battle under conditions of forced defence—conditions which the art of war shows are fatal to the defender.

The two objectives which realised Falkenhayn's conditions were Belfort and Verdun. The capture of Belfort involved the evacuation by the French of Upper Alsace. Verdun, however, was important for three reasons. From Verdun the French could launch an attack, similar to that contemplated by the Germans, upon the German communications. "Verdun," said Falkenhayn's report, "is the strongest starting point for any attempt by the enemy to threaten the whole German front in France and Belgium with relatively small forces." The French lines were but 12 m. from the German communications. Throughout the War German headquarters dreaded an Allied attack starting from Verdun, and with justice since it was from Verdun that Marshal Foch hurled the great American attack on Sept. 25 1918 (see VICTORY, ADVANCE TO).

**French Preparations.**—An attack on Verdun had been foreseen by the French side. Col. Driant, Deputy for Nancy, who commanded a group of chasseurs in the fortified region of Verdun, at the Bois de Caures, wrote to the Minister for War that the decisive blow would be struck on the line Verdun-Nancy. The defensive organisation of Verdun was very incomplete. It could hardly be otherwise. Gen. Herr, by the instructions of Aug. 9 had to link up the III. Army in Argonne with the I. Army in the Woëvre. That involved the revision of the defensive system of the fortress from a circular scheme to one of a

series of parallel and successive lines. But the Supreme Command, disturbed by the thrust of the Germans in the Argonne, also ordered Gen. Herr to prepare a defensive position on the left bank in case Verdun had to be abandoned. Gen. Herr could not manage this double programme with his resources and of four positions suggested on the right bank, only the first existed at the end of Jan. 1916.

On Dec. 3 Col. Driant was in Paris and communicated his views to his colleagues on the Commission of the Army. Gen. Pedoya, President of the Commission, passed the warning to Gen. Gallieni, the Minister for War, who wrote on Dec. 16 to Marshal Joffre inquiring whether all along the front a defensive system of at least two lines had been planned and carried out with such constructional features as were necessary in support. On the 18th Joffre replied somewhat confusedly and stated that the improvement of the double line system already existing along the whole front had been ordered on Oct. 22, that the organisation of the fortified areas in the rear of the armies had also been ordered, and that this combination of defensive measures was in process of completion and at a number of points had been completed. He ended thus: "I consider there is no justification for the fears you express in the name of the Government in your despatch of the 16th of December." He complained that the criticisms had not reached him in the proper official manner and offered to resign.

Gallieni replied on the 22nd that the Government hoped that the works still to be completed would be carried out with all

speed and care and that the Government had full confidence in the Commander-in-Chief. In order to conceal its plans about Verdun the German High Command arranged to carry out preliminary measures at several points on the front. The French Staff was for long in doubt whether the attack would come in Artois or in Champagne. But from Jan. 1916 French airmen reported enemy preparations on the Verdun front. On Jan. 16 Gen. Herr collected all this information in a formal report and asked for a division to reinforce him. This was sent to him. On the 19th Gen. Castelnau, as Inspector General, visited the front. In his letter of the 26th to Gen. Herr, summing up the results of his visit he stated that the first line was in accord with requirements. He ordered the construction of strong points for the reserves and of closed redoubts with counterscarp. The second line was to be strengthened and the defensive works carried to the counterscarp.

## II. THE FIRST BATTLE

On Feb. 8 1916 it was discovered that the Germans had brought a mass of manoeuvre to the neighbourhood of Verdun. A deserter disclosed the presence of the III. Corps and the VIII. Res. Corps. On the 11th an intelligence officer reported a concentration of troops on the right bank of the Meuse, which included the XV. Corps and heavy artillery. The French Command at once took precautions. On Feb. 13 three divisions of the VII. Corps (14th, 37th and 48th) were moved to Souilly a march south of Verdun, followed on the 16th by two divisions of the XX. Corps. On the 20th the Commander-in-Chief, who had inspected this front on the 19th, ordered the I. Army to place the 16th Div. at Gen. Herr's disposition, thus completing the XX. Corps. Between Feb. 10 and 20, 85 heavy guns were added to the equipment of the Verdun Frontier Region, the scene of the future battle. It thus had 388 field guns and 244 heavy guns.

*French Supply Problems.*—Transport questions arose. Ordinarily two standard gauge railways serve Verdun. The southern line had been cut by the enemy. The western line would be, and was, cut as soon as operations started. A departmental railway, the Meusien line, and a road from Bar-le-Duc still remained. To maintain supplies for an engagement in which 15 or 20 divisions are engaged, the daily requirements are 2,000 tons of munitions, 100 tons of supplies and material for each division, say 2,000 tons, and from 15,000 to 20,000 men. The Meusien Railway at best carried 800 tons daily. On the 19th Capt. Doumenc, commanding the M.T. service, undertook to carry 2,000 tons and 12,000 men daily in lorries provided that the M.T. service had sole control over the roads. Motor traffic was organised on the 20th on railway lines. From the 29th, 3,000, later 3,500, lorries passed in an endless stream along this little road only seven yards wide. 6,000 vehicles passed a given point in 24 hours, an average frequency of one vehicle every 14 seconds. At times the traffic rose to one vehicle every five seconds. In the language of the War this road was known as the "Sacred Way" (La Voie Sacrée).

*German Dispositions.*—Verdun was confronted by the German V. Army—part of the command of the Crown Prince, who directed the offensive. The Germans had 26 divisions available on the Western Front. A third of these were kept as a general reserve; 17 to 18 divisions were therefore available for the Verdun attack. The German Command allotted nine divisions to the first attack, which started from the right bank. East of the Meuse was the VII. Res. Corps (one division in line, one in support); then the XVIII. Corps and the III. Corps in echelon of divisions. Further east the XV. Corps was held in the plain of the Woëvre, ready on the breach of the French front to hurl itself on the French flank. The 113th Div., completing the assault troops, was in support. This mass of manoeuvre had been embodied in the Crown Prince's Army command and to make way for it, room was made between the V. Res. Corps and the VI. Res. Corps. The duty of the latter, on the left bank of the Meuse, was to attack the French when broken on the right bank and to bar their retreat. Thus it was engaged only on March 6.

On Feb. 21 1916 at 7:15 A.M. the Germans commenced bombardment on a front of 25 m. from the Bois d'Avocourt to Étain. It was of unheard of intensity. Heavy shell were used in vast quantities, not a shell was smaller than 150 or 210 millimetres. The woods were full of guns which fired ceaselessly with measured regularity. Observers from the air ceased to mark batteries on the map. The woods to them were masses of clouds pierced by flashes of lightning. Soon the French squadrons were chased from the sky. The enemy had mastery of the air as of the artillery duel.

*The Attack Opens.*—About 4:45 P.M. the first infantry attack was launched. Commandant Vouvard remarks that "It is probable that there were strong reconnoitring parties to test the efficacy of the artillery preparations and to seize trenches which had been destroyed. Beyond doubt that first day the Germans sought to put their infantry in an advantageous position and to get into line for the battle of the next day, by making it pass even the unequal intervals separating the lines." As a fact, the Germans, to effect a surprise, had not dug parallels from which to issue and moved from their lines at distances from the French lines which varied from 600 to 1,100 metres. Gillet describes their new tactics thus: "Each troop had a specific task, with an objective of limited breadth and depth. Before taking hold of it, a wave of scouts was sent forward to test the destruction by the artillery fire. If the destruction were not thorough the scouts retired and further artillery preparation was organised. The attack took place in waves about 80 metres apart. First came a line of pioneers and men with bombs. Then came the main body in single file. Then followed a reserve section carrying up ammunition, tools, sandbags, and filling up gaps in the first wave. A second line followed in the same order, passing through the first line, supporting it if checked and renewing the assault on their own initiative. The attack should now proceed by encircling movements, utilising cover and passing along ravines. Thus the centres of resistance would fall one by one. Shell fire would support the advance continually. On no account should troops attempt to overcome resistance which has not been broken by artillery fire. Units when held up must wait for fresh artillery action."

*Early German Successes.*—The French line rested on the village of Brabant, then on the Bois de Consenvoye, Bois d'Hautmont, Bois de Caures, Bois de Ville and on Herbebois. A little in the rear the Bois de La Waville (southeast of the Bois de Ville) and the village of Beaumont had been strengthened with redoubts. On the extreme right the line rested on the village of Ornes. Before the German attack, what remained of the French trenches was filled with defenders. At Herbebois the Germans captured the first lines but were stopped in front of the supporting trenches. The Bois de Caures was lost but its northern part was retaken during the night. The loss of the Bois d'Hautmont was a serious matter. A French counter-attack on the 22nd at 6 A.M. failed. The line had been pierced.

The Germans made good use, on the 22nd, of the advantage gained at the Bois d'Hautmont. The village of Hautmont was destroyed by shell fire and at 5:00 P.M. was attacked by three columns. The main redoubt, built of concrete, collapsed and buried 80 men. The remaining defenders were hunted from the cellars by bombs and liquid fire but rallied at Samogneux. Bois de Ville was lost. Bois de Caures was then enveloped on the right and left and Col. Driant decided to withdraw his chasseurs to Beaumont. He was the last to leave the wood and was then killed. On the 23rd the village of Samogneux was overwhelmed by shells and set on fire but the garrison held on till night fell. On the extreme left the village of Brabant outflanked by the German advance became untenable and was evacuated. On the right Waville and Herbebois were lost and the front passed along the northern edges of Bois des Fossés and La Chaume.

In three days the Germans had captured the first of the French positions. Each side was reinforced on the 24th. A fresh regiment from the V. Res. Corps was sent to each of the German corps. The corps on the right which, having gained the greatest success, thereby became as it were a pivotal wing, also

received a battalion of chasseurs. On the French side the two divisions in line from the 21st were relieved from the left by a division of the VII. Corps, on the right by two brigades from the XX. Corps. These troops, thrown at night into doubtful positions in the open country, were immediately destroyed. The 24th was the most critical day of the whole battle. On their right, where the Germans sought to move out from Samogneux, they were nailed down by the French artillery on the left bank. But they started a fresh attack immediately eastwards and captured all the line Beaumont, Bois des Fossés, Bois des Cauières. Further they penetrated towards Douaumont along the ravine of the Vauche.

The second French position was lost in one day. In the evening the situation was so grave that Gen. Langle de Cary, commanding the Centre group of Armies, ordered the II. Corps, then closely engaged in the Woëvre, to fall back on the Heights of the Meuse. This movement was carried out during the night. That same evening (24th) Gen. Joffre handed over the operations before Verdun to a fresh army, the II., commanded by Gen. Pétain, who after the Battle of Champagne had been resting at Noailles. The X. Army, on relief by the British Army, was placed in the general reserve.

*New French Dispositions.*—The initial task of the army under instructions of Feb. 25 at 9:00 A.M. was to gather together the troops of the Verdun area on the left bank and to prevent the Germans from crossing the Meuse. But on the 24th at midnight Gen. Castelnau set out for Verdun armed with full powers from the Commander-in-Chief. He halted at Avize, headquarters of Gen. de Langle de Cary, whence at 5:45 A.M. on the 25th he telephoned to Gen. Herr to order him to hold at all costs the line on the right bank facing north between the Meuse and Douaumont and, facing east, on the Heights of the Meuse. At 7:00 A.M. Gen. Castelnau reached Dugny, the headquarters of Gen. Herr. Gen. Pétain went on the morning of the 25th to Chantilly and thence to Dugny, which he reached in the evening. He took charge of the battle on the 25th at midnight.

During the 25th, on the French left, the Germans advanced

1,500 metres south of Samogneux up to the mill of Cotelettes. Further east they captured Bezonvaux. A party of Brandenburgers crept up to the fort of Douaumont, found it empty and took possession of it. Gen. de Bonneval, commanding the 37th Div. on the French left on the Talon and the Poivre Hills was afraid of being surrounded and ordered retreat on the Belleville Hills. This order was only partially carried out. The Zouaves held their position on the west of the Poivre. On the other hand while the 37th Div. retreated, the 39th Div. of the XX. Corps, going up into the line, passed it and covered the line Bras-Haudimont.

On the 26th Gen. Pétain, at his headquarters at Souilly, reorganised the battle plan. He drew a sharp line—Bras-Douaumont—which he entrusted to the XX. Corps. He divided the area into four sections: (1) under Duchesne in the Woëvre, (2) under Balfourier from the Woëvre to Douaumont, (3) under Guillaumat astride the Meuse, and (4) under Bazelaire on the left bank. The artillery as it arrived was divided between these four commands. On Feb. 21 it consisted of 388 field guns and 244 heavy guns. In a few weeks there were 1,100 field guns, 225 guns of calibres from 80 to 105 mm. and 500 heavy guns. Many fresh battery positions were created and linked up by telephone. The French regained the mastery of the air. The 50th Div. was set to build two defensive positions chosen on the 27th and redoubled on March 2 by two intermediate lines. Bridges were built across Meuse. Three thousand territorials repaired and widened the Sacred Way.

*French Resistance Stiffens.*—Reinforcements arrived. The I. Corps was at Souilly on the 25th and the XIII. Corps at Revigny. The XXI. Corps followed it two days later. The XIV. Corps detrained on the 20th and the III. Corps on the 29th. Between the 26th and the 29th the Germans hurled violent attacks against Douaumont, using 500,000 men. On the east they reached the position of Hardaumont and attacked Bois de la Caillette. They stopped, exhausted, on the 29th. It was the first lull for eight days. Gen. Castelnau deemed the situation firmly held (Calée) and returned to Chantilly.

## III. THE SECOND PHASE

The Germans failed to gain an immediate decision at Verdun. They soon realised that the British Army was about to attack them on the Somme. At the beginning of April they had to reinforce their front on the Ancre by a division. For four months they kept the battle of Verdun going with furious tenacity in order to disorganise the attack prepared by the Allies in Picardy. For the French Staff the problem was to hold on at Verdun without ceasing to prepare for the Somme, to exhaust the enemy as much as possible in advance and to wear him out for the attack on the Somme.

*Front of Attack Extended.*—The principal episodes of that struggle were the capture on March 4 of Douaumont after a violent attack on the 2nd. The French entrenched themselves 200 metres south. On March 6, as Gen. Pétain had expected and feared from the beginning, the Germans extended the action to the left bank. The attack was made by two corps, the VI. Res. and the X. Res., the latter taken from the General Reserve. On the 6th they captured the Hill de l'Oie and on the 10th Bois de Cumières. They were thus enabled to attack one of the pillars of the main line of defence, the Mort Homme. On the 14th they captured the lower crest of that double hill. The higher crest, Peak 295, could be held by neither side and was No Man's Land.

The second pillar of the French line, further to the west, and known as Hill 304, was attacked on March 20 by the 11th Bavarian Div. which took the Bois d'Avocourt but could not issue thence. While extending his attack on his right, the Crown Prince also developed it on his left. On March 8 the III. Corps with the 113th Div. and two regiments of the XV. Corps attacked on the line Douaumont-Hardaumont. The works at Hardaumont were taken. Next day the attack was developed further. On the west the VII. Res. Corps attacked the Côte du Poivre while the 21st Div. advanced on the ravines and crests between the Côte du Poivre and Douaumont. On the east the V. Res. Corps attacked the village and fort of Vaux but met with a bloody reverse, renewed on the 16th and 18th.

The Germans brought up fresh troops and the battle began again on March 28 on the left bank. It ended on April 8 by the French losing all that remained of their former front line. The new front passed thereafter by the redoubt at Avocourt, the first slopes of Hill 304, the southern reverse of the Mort Homme and the north of Cumières. On the right bank on March 31 the Germans captured the village of Vaux, which had held out till then, and on April 2 took the lake behind the village. Then on April 9 the Crown Prince attacked on both banks on a scale not known since the first attacks in February. On the left bank alone, 11 regiments were involved. The results were insignificant. On the morning Gen. Pétain wrote in his orders of the day "the 9th April was a glorious day for our Armies . . . Courage. *Nous les aurons.*"

*French Counter-Attacks.*—On April 20 the French counter-attacked on the left bank in order to clear the Mort Homme. The 40th Div. continued the struggle till May 3. The eastern front became practically what it was before the German attack of April 9. But on May 3 the Germans renewed the offensive by an attack on Hill 304. On the 8th they captured Bois Camard, west of the Hill. On the 13th and 16th they attempted without success to advance from this position. They then organised a new attack on the 18th with a fresh corps, the XVIII. Res. Corps and two divisions of the XVIII. and added on the 22nd the 22nd. Res. Division. This violent battle ended on the 24th with the capture of Cumières. As the Germans had no reserves available the tired units could not be relieved and on the 26th they lost a portion of the trenches they had won. On the right bank in front of Douaumont, where on the 22nd the French made a vigorous counter-attack on the I. Bavarian Corps destined for the left bank. They held Douaumont but their attacks on the left bank were checked.

There had been changes in the command. On April 2 the right bank section had been placed under the orders of Gen. Nivelle, the left bank under Gen. Berthelot. At the end of

April Gen. Pétain was called to command the Armies of the Centre and handed the II. Army to Gen. Nivelle. The Germans, too, from March had divided the field of battle into two sections, Gen. von Mudra commanding on the right bank, Gen. von Gallwitz on the left bank. In April Gen. von Mudra was replaced by Gen. von Lochow. In July Gen. von François relieved von Gallwitz. The Allies' preparations on the Somme took definite shape. Before all things the Germans had to prevent the French from taking part in these operations. For this a new success in the Meuse was necessary.

*Germans Capture Thiaumont and Fleury.*—The main French line of defence on the right bank was the Côte de Froide Terre—Fleury—Fort de Souville. On the right this position was covered by the fort of Vaux, on the left by the crest of Thiaumont. It was first necessary to capture Vaux and Thiaumont. On June 1 these two positions were attacked. Vaux was taken on the 9th. Thiaumont farm, taken by the Germans on the 1st, was recaptured by the French on the 2nd, who lost it again on the 9th. German attacks on the Thiaumont outworks behind the farm failed completely. They succeeded in establishing themselves on the west and opposite side in the ravine of La-Dame. At the same time battle was resumed on the left bank. Between May 29 and 31 the Germans took Cumières but tried vainly to move out of Bois Camard against Hill 304. On the 15th the French resumed the offensive and recaptured a kilometre of trenches on Mort Homme.

Time pressed more and more. On June 4 Gen. Brusilov started a wide offensive in Volhynia. In his announcement of the Russian victories of June 13 to the troops, Gen. Joffre said: "Soldiers of Verdun, to your heroic resistance we owe these victories. From your resistance will spring the victories we are soon to win." In these conditions the Germans attacked the line Froide Terre-Souville on June 21 in the grand style, with 19 regiments. On the west the Bavarian Corps took the fortified post of Thiaumont but was checked in front of the fort at Froide Terre. In the centre the Alpine Corps captured Fleury. On the west the 103rd Div. took the first line of trenches in front of Souville but failed before the second line. So serious was the situation for the French that on June 23 Gen. Pétain commanding the Armies of the Centre warned Gen. Joffre and suggested moving to the left bank if the enemy reached the counterscarps. Joffre's answer on the 27th was a peremptory order to hold on to the right bank.

*The Turn of the Tide.*—Meanwhile the preliminaries of the great Franco-British offensive on the Somme started on June 24 and the actual battle began on July 1. On July 11 the Germans made yet another attack on Verdun—from Vaux to Souville with 12 regiments. It crumpled up on the slopes of Souville the principal objective. On Aug. 1 another attack with eight divisions also failed. On Aug. 3 the French retook Thiaumont and Fleury on Aug. 4. The Germans regained Thiaumont on the 8th. Throughout the whole month there was local fighting. The last German attack on Sept. 3 also failed. The battle of Verdun, properly called, had come to an end. From Feb. 21 to June 15 the Army at Verdun had seen 66 divisions on its front. Up to July 1 the Germans had used up 43½ divisions. It is true that they maintained them on the ground by depots situated a march behind the front and left them fighting till worn out. The French artillery fired 10,300,000 rounds with the field artillery, 1,200,000 rounds of medium calibre and 600,000 rounds of large calibre.

## IV. VERDUN SET FREE

On Sept. 13 M. Poincaré handed to Verdun the cross of the Legion of Honour and Allied decorations. The ceremony took place in the casemates of the citadel. From that moment began a new phase, that of the liberation of Verdun. To a large extent the glory of this feat belongs to Gen. Mangin. He it was who led the attack on Douaumont on May 22. Called from the battlefield of Verdun on June 22 he was placed in command of Group D, which then stretched from the Meuse to Fleury and was progressively enlarged right up to the cliffs of the Meuse.

On Sept. 17 in a report to Nivelles he set forth reasons for abandoning operations in detail and for seeking to free Verdun by a plan on broad lines.

**Relief Offensive Opened.**—The first scheme, approved by Nivelles on Sept. 21, dealt only with an advance up to 300 metres north of the farm of Thiaumont. The scheme of the 24th went further and included the fort of Douaumont as far as possible. A third scheme, that of Oct. 9, covered the capture of the fort of Douaumont and perhaps that of the fort of Vaux. A formidable artillery preparation with 650 guns started on Oct. 21. The assault was delivered on Oct. 24 at 11:40 A.M. by three divisions, the 38th on the left, 133rd in the centre, and 74th on the right. The first waves marched under a rolling fire which progressed according to a set time-table, so that the infantry were as it seemed fastened to a wall of steel. By night Douaumont was taken with 6,000 prisoners. The division on the right had not reached the fort of Vaux which was evacuated by the Germans on Nov. 2, the day before the date fixed for attack by the 63rd Division.

**The Fortress Liberated.**—In order to exploit this success to the full Gen. Mangin was obliged to restore his ammunition reserves by continued economy. He intended to attack again on Dec. 5 over a front of 10 m. in order to retake at one blow the whole of the former second French line which had been lost on Feb. 24. Artillery preparation started on Nov. 29 with 750 guns. Bad weather intervened. The Germans had been warned and the value of a surprise was lost. In order to upset the plans of the French the Germans made a violent attack on Dec. 6 and captured Hill 304. Fine weather returned on the 9th and Nivelles recommenced the artillery preparation. It was a keen struggle—the Germans replying vigorously. In the air, too, battle was set. On the 15th at 10 A.M. the attack was made. The German barrage started two minutes too late. The attack had started, four divisions—126th, 38th, 37th and 133rd—being in line. By night they had retaken the whole of Poivre Hill. The line was in front of Hill 378, stopped 20 metres south of the farm at Chambrettes, then turned south across Bois d'Hardaumont and la Vauche up to the outwork at Bezonvaux. The French captured and destroyed 115 guns and took 9,000 prisoners. This, known as the battle of Louvemont, was completed on the 18th by the recapture of Chambrettes with a total of 11,387 prisoners. It was the end of the battle of Verdun. On the evening of Dec. 15 Nivelles took over the command of the Armies of the North. Mangin went to the VI. Army. The II. Army was entrusted to Gen. Guillaumat and reduced from 25 to 15 divisions. The spring passed in organising the area conquered and in making preparations for the final battle.

**The Final Battle.**—In the summer of 1917 Pétain formulated plans for a series of limited offensives for the purposes of raising the spirit of the army and decided on an operation on the northern front of Verdun on both banks having as objectives, Mort Homme on the left and Samogneux and Beaumont on the right. From these positions the line would link up with Bezonvaux through Bois le Chaume and Bois des Caurières. The Germans, however, anticipated the French by making an attack on the left bank on June 28 which was followed by fighting right up to Aug. 3. The attack planned by Pétain was delivered on Aug. 20 after six days' heavy artillery preparation. The XIII. and XVI. Army Corps attacked on the left bank, the XV. and XXII. on the right bank, 16 divisions in all being engaged. Mort Homme was captured on the 20th, Hill 304 on the 24th. On the right bank Hill 344 was taken on the 20th, Samogneux on the 21st. More than 10,000 prisoners were taken. Beaumont alone remained in German hands. This was the final battle of Verdun.

**VERDY DU VERNOIS, JULIUS VON** (1832-1910), German general and military writer (see 27.1019), died at Stockholm Sept. 30 1910.

**VERGA, GIOVANNI** (1840-1922), Italian novelist (see 27.1021), died in Rome Jan. 27 1922. *Cos'è il Re* (short stories) was published in 1922, and two of his works were translated into English by D. H. Lawrence: *Mastro-don Gesualdo* (New York, 1923), and *Little Novels of Sicily* (Oxford, 1925).

**BIBLIOGRAPHY.**—Laura Gropallo, *Autori italiani d'oggi—Giovanni Verga, etc.* (1903); L. Russo, *Giovanni Verga* (1920); C. A. Levi, *Autori drammatici italiani, G. Verga, etc.* (1922); N. Scalia, *Giovanni Verga* (1922).

**VERHAEREN, EMILE** (1855-1916), Belgian poet (see 27.1023), greatly increased his reputation during the last years of his life, mainly owing to the publication of his chief work *Toute la Flandre*, which he wrote from 1904-12 and which includes six series of poems dealing with the memories of his boyhood, *Les tendresses premières*; the Belgian coast, *La Guirlande des dunes*; various episodes of Flemish history, *Les héros*; life in the small towns, *Les villes à Pignons*; and the Flemish countryside, *Les plaines* and *Les blés mouvants*. The comparison between this great work and the first volume of verse published by the poet in 1883, on a similar subject *Les Flamandes*, shows the full development of his technique and of his genius. In 1911, Verhaeren published *Les heures du soir*, a series of intimate poems dedicated to his wife, completing two previous series published in 1905, *Les heures de l'après-midi*, and in 1896, *Les heures claires*. His tragedy, *Hélène de Sparte*, was produced in Paris in 1912. During the World War, the poet wrote *Les ailes rouges de la guerre* (1916), which contains an ode to Rupert Brooke, and two short volumes of prose, *La Belgique sanglante* (1915) and *Parmi les cendres* (1916). He died on Nov. 27 1916, a victim of a railway accident in Rouen station. Selections of Verhaeren's poems have been translated into English by Jethro Bithell and by Alma Strettell. An English version of his *Love Poems* has been published by F. S. Flint, and the plays have been translated by Arthur Symons, Osma Edwards, F. S. Flint and Jethro Bithell.

**VERMONT** (see 27.1025).—The population of the State was 352,428 in 1920, as compared with 355,956 in 1910, a loss of 3,528, or 1%. As in many other States, there were losses in the rural districts and gains in industrial towns and cities. In 1910, 27.8% of the total population lived in villages and cities of 2,500 and over, and in 1920, 31.2%. Native whites of native parentage constituted 64.7% of the population. Foreign born whites constituted 12.6% of the population. Of the foreign born whites, 31.8% were French Canadians, and, including all Canadians, the percentage was 55.8. The following are the cities and towns having a population of 9,000 or over and the percentage of increase or decrease for the decade:—

|                    | 1920   | 1910   | Percentage inc. or dec. |
|--------------------|--------|--------|-------------------------|
| Burlington . . . . | 22,779 | 20,468 | +11.3                   |
| Rutland . . . . .  | 14,954 | 13,546 | +10.4                   |
| Barre . . . . .    | 10,008 | 10,734 | -6.8                    |
| Bennington . . . . | 9,982  | 8,698  | +14.8                   |

**Agriculture.**—Vermont is pre-eminently a dairy state and its principal crops are hay and forage grown for cattle. The number of farms in 1920 was 29,075, and in 1910, 32,709, a decrease of 3,634, or 11.1%. Improved land increased from 1,633,965 ac. in 1910 to 1,691,595 in 1920, a gain of 3.5%. The value of all farm property in 1920 was \$222,736,620, an increase of 53.2% over the 1910 total of \$145,399,728. The average value per farm was \$7,661 in 1920, a gain of 72.4 over 1910. The average Vermont farm area, 145.7 ac. is the largest of any State east of the Mississippi river. On Jan. 1 there were 377,000 milch cows, 83,000 other cattle, 73,000 horses, 48,000 sheep and 50,000 swine. Much milk and cream is shipped daily on special trains to the New York and Boston markets. In 1925 practically half the milk and cream supply of Boston came from Vermont dairies and quite a good proportion of that consumed in New York City. Vermont's ratio of dairy cows *per capita* (1.19) is the highest of any State. Only three States surpass Vermont in percentage of pure bred cattle.

The value of Vermont crops as reported by the census of 1920 was \$47,999,600, and of this total the value of hay and forage was \$29,581,464. In round numbers there were produced cereal crops worth \$5,000,000, chiefly corn and oats; vegetables valued at \$7,000,000, of which white potatoes were valued at \$5,000,000; maple sugar and syrup, worth \$3,500,000; and fruits worth \$2,000,000. The total value of all Vermont's agricultural output crops, dairy products, poultry, eggs, maple sugar and syrup, meat products and forest products of farms, was \$89,757,053. Crop reports of the U.S. Dept. of Agriculture for 1924 showed that Vermont led all other States in average yield of bushels of corn per ac. (47 bushels). In 1924 the production was: oats, 2,888,000 bu.; maize, 3,901,000 bu.; wheat, 21,000 bu.; barley, 279,000 bu.; potatoes, 3,340,000 bushels. Vermont produces more maple sugar and syrup than any other State, according to crop reports of the U.S. Dept. of Agriculture (1925).

**Manufacturing.**—Vermont leads all other States in the production of marble and granite and ranks second in its output of slate and talc. Owing to its large supply of hard and soft woods, it contains many woodworking establishments. It contains the largest plants in the United States producing scales, pipe organs and reed organs, screen windows, portable ovens and brush fibre. In 1921 there were 1,101 manufacturing establishments; 2,931 salaried employees, receiving a total of \$6,433,000; 25,767 wage earners, receiving a total of \$28,068,000. Raw material to the value of \$63,688,000 was used; and the output amounted to \$113,904,000—a decrease of 32% on that of 1919.

There are large plants in Springfield and Windsor making machine tools, and Springfield contains a large factory for utilising reworked wool. Bellows Falls contains large paper mills; Burlington and Brattleboro manufacture cotton goods on a large scale, and Winooski contains a large woollen factory. Bennington is noted for the manufacture of knit underwear. Readsboro contains a large plant manufacturing school furniture. Package dyes, butter colour, children's washable play clothes, refrigerators and boxes are made in large quantities in Burlington. Rutland manufactures silos, maple sugar utensils and marble- and granite-working machinery. Brattleboro produces chairs and overalls in large quantities. Barton produces piano actions; Orleans, piano sounding-boards. Montpelier manufactures saw-mill machinery and clothes pins. St. Albans contains a large factory manufacturing summer clothing. Bristol contains a large burial-casket factory. In Hyde Park is a very large plant dealing in green calf skins.

**History.**—During the administration of Gov. Fletcher, the State constitution was amended, changing the date of the biennial State elections from Sept. to Nov. and the time of the convening of the legislature from Oct. to January. The power of the governor was strengthened by requiring a two-thirds instead of a majority vote for overriding the veto. The power of commuting sentences was taken from the legislature. In 1915 a workman's compensation law was enacted. Beginning in 1912 a series of Acts was passed leading to the establishment of a State system for the care of dependent, neglected and delinquent children. An important step was taken in 1917 in co-ordinating the work of State departments, commissions and boards, and it was carried still farther in 1923. A direct primary law was passed in 1915 with a referendum clause attached. The result of the referendum was a small majority in favour of the law. A presidential primary Act was repealed in 1921. The educational laws were revised in 1915 and in 1923 greater control in the management of school affairs was given to municipalities.

Following the ratification of the amendment to the national constitution granting the right of suffrage to women, the State constitution was amended along similar lines, and in 1921 a law was enacted giving women the right to hold office.

Vermont has been Republican in State and national politics since the organisation of the party. The recent governors have been: John A. Mead, 1910-2; Allen M. Fletcher, 1912-5; Charles W. Gates, 1915-7; Horace F. Graham, 1917-9; Percival W. Clement, 1919-21; James Hartness, 1921-3; Redfield Proctor, 1923-5; Franklin S. Billings, 1925- . (W. H. CR.)

**VERRALL, ARTHUR WOOLGAR** (1851-1912), British scholar, was born at Brighton Feb. 5 1851. Educated at Wellington and Trinity College, Cambridge, he graduated in 1873, becoming fellow and tutor of his college. He published editions of many classical plays, especially the *Medea* (1881), *Agamemnon* (1899) and *Choephore* (1893). In 1895 appeared *Euripides the Rationalist*, followed in 1905 and 1910 by editions of most of Euripides' plays. He was an original critic, and a frequent contributor to *The Classical Review* and other journals. In Feb. 1911 he was appointed to fill the new King Edward VII. professorship of literature at Cambridge, which had been endowed by Sir Harold Harmsworth, later Viscount Rothermere. He died at Cambridge June 18 1912.

**VERSAILLES, TREATY OF.**—The German Treaty was signed on June 28 1919, and came into force by exchange of ratifications on Jan. 10 1920. It was intended originally that it should be only one part of a general and inclusive treaty, comprising settlement with Austrians, Hungarians, Bulgars and Turks, as well as Germans. In such case it would have been strictly comparable to the Treaty of Vienna in 1815, which was, in fact, an "omnibus treaty." But the delays in dealing with these peoples, particularly Hungarians and Turks, not only separated the German Treaty from the others, but caused it to be the first to be signed and the first to come into force, just as it was the first in importance. It is also an important fact that, in the end, all the Principal Allied Powers (except the United States) recognised the Wilsonian principles and maintained that they had been applied in the German Treaty. No state, except the United States, recognised or attempted to apply the Wilsonian principles to the Austrian, Hungarian, Bulgarian or Turkish treaties.

#### I. NEGOTIATIONS BEFORE THE ARMISTICE

It is important, therefore, at the outset to understand the implications of the correspondence conducted between the German Govt. and President Wilson during Oct. and Nov. 1918, when the former was asking for peace. The governing document of the series is the reply of President Wilson to the German Govt. of Nov. 5, which embodied the result of the decisions of the principal Allied and Associated Governments as a whole (i.e., France, Great Britain, Italy and the United States).

In that document they offered to make peace on the basis of President Wilson's speech of Jan. 8 1918, which embodied the "Fourteen Points" (excluding only point 2 relating to the freedom of the seas). In addition, they promised to make peace by "the principles of settlement embodied in his subsequent addresses," i.e., speeches up to Nov. 5 1918. They added to this a definition of what was meant by President Wilson's statement, (Jan. 8 1918):—

That the invaded territories must be restored, as well as evacuated and freed, and the Allied Governments feel that no doubt ought to be allowed as to what that provision implies. By it they understand that compensation will be made by Germany for all damage done to the civilian population of the Allies and their property by the aggression of Germany by land, by sea and from the air.

So we may say that the Allies offered to make peace on the general basis of President Wilson's speeches in 1918, *minus* his point about "freedom of the seas," and *plus* a definition of loss and damage. The Germans sent no reply to this offer in writing, but in fact accepted it by communicating with Marshal Foch and asking for an armistice. The Germans never denied that they were bound by the Wilsonian principles, and the Principal Allies explicitly admitted their binding force in their reply to Germany of June 16.<sup>2</sup> So there was no difference between Allies and Enemies as to the binding character of the Wilson principles in the German Treaty, though they differed greatly in the end as to their interpretation. The course of the negotiations is related in the article PEACE CONFERENCE, and all that can be done here is to indicate the character of the treaty itself and its apparent meaning as deduced from its clauses. It is at once the

<sup>1</sup>For the text see FOURTEEN POINTS.

<sup>2</sup>Text of the Reply in Misc. 4, 1919, Cmd. 2883 (H.M. Stationery Office).

largest and the most complicated of modern treaties, and the best way to analyse it would seem to be to take its 15 parts separately.

## II. ANALYSIS OF THE TREATY

*Part I. The Covenant.*—Part I. deals with the Covenant of the League of Nations (*see* COVENANT). It may be here remarked that the Covenant unites all its members in a league guaranteeing their territorial independence and integrity. The entrance of Germany into the League was deprecated at the time by some of the Allies and only became a certainty after the signature of the agreements of Locarno on Dec. 1 1925, and their ratification in 1926. The most important powers granted to the League are the supervision of Mandated Territories (art. 22), whereby the future government of the German colonies, after having been assigned to various mandatory Powers, is subject to supervision by the Permanent Mandates' Commission. This is appointed by the League, and it inspects the annual reports of the mandatory Powers on the territory committed to their charge.

Similarly, the racial and religious Minorities' Treaties have been placed under the guardianship of the League, but their supervision here, though real, is not so effective as over territories under the mandates. Ultimately the supervision of disarmament, as provided in the German Treaty, is to fall into the hands of the League, and this has finally been accomplished by the dissolution of the inter-Allied naval and military commissions and their supersession by the League at the end of 1925. The international control of health and disease is provided for in article 25 and has been actually much extended since. Article 23 provides for international co-operation in labour questions (*see* below, Part XIII.).

The most binding obligation of the League is found in articles 12-16, by which members bind themselves not to go to war in disregard of its covenants until three months of arbitration or inquiry by the council have elapsed. It is provided under article 8 that the League shall formulate plans for reduction of national armaments, and it will take the lead in the disarmament conference about to meet in 1926.

The actual machinery, through which the League functions, consists at the outset of a council of nine, of whom five must be France, Great Britain, Italy, Japan and the United States. As the latter declined to accede, five out of the original nine seats were left to be filled by smaller states, whose representatives are elected by the Assembly of the League. The Assembly consists of representatives of all member states, and is an annual international Parliament. Two institutions connected with, but actually separated from the League are the Permanent Court of International Justice (provided for under art. 14), and the International Labour Office and annual conference (art. 23-4). The League also, as will be described below, is the governor of two important pieces of territory, the Saar basin and the free city of Danzig.

*Parts II. and III. Territorial Dispositions.* (a) *Western Frontiers.*—Germany lost territory in the south, north and east as a result of the War, whilst other arrangements tended to weaken her influence beyond her own borders. Belgium, for example, ceased by article 31 to be a neutralised state, and has since entered into a military alliance with France. She has also acquired by cession from Germany the frontier districts of Moresnet, Eupen and Malmedy (art. 32-4); Luxembourg similarly ceases to be a neutralised state (art. 40-1), and has since entered into an economic union with Belgium. By articles 42-4 the whole left bank of the Rhine and the right bank to the west of a line drawn 50 km. to the east of the Rhine, has been demilitarised forever. Fortifications are to be dismantled there, and no permanent works for manoeuvre or mobilisation are to be permitted.

By articles 45-50 the Saar basin forms an area under the control of an international commission and of the League, and its coal-mines are ceded to France. At the end of 15 years a plebiscite will be taken, whereby the inhabitants will vote as to their preference (a) for the existing international régime, (b) for union

with France, (c) for union with Germany. Finally, and most important of all, by articles 51-79, Alsace and Lorraine are ceded by Germany to France. The latter thus gains nearly 2,000,000 inhabitants, great strategic advantages, and over three-fourths of the German-produced iron with other valuable minerals.

(b) *Northern Frontier.*—Toward the north Germany consented (art. 115) to demolish the fortifications of Heligoland and to demilitarise it, but she retains its territorial sovereignty. She has lost the northern part of Schleswig to Denmark. By articles 109-14 it was provided that there should be a plebiscite in two zones. Of these, the northern voted for incorporation with Denmark and the southern, or Flensburg, zone elected for Germany. Denmark thus received that plebiscite which Bismarck had promised her but which he never gave (Art. III., Treaty of Nikolsburg July 26 1866).

(c) *Eastern Frontier.*—By articles 87-93 it was provided that there should be a plebiscite in Upper Silesia. This has resulted (1921) in a decision in which the southern half of the area—including valuable mines—passed to Poland, the upper half returning to Germany. Two other such plebiscites were provided for in East Prussia in the Allenstein and Marienwerder districts respectively, both of which went in favour of Germany. By the boundaries as drawn, a large part of the Posen and Bromberg area goes to the new Polish Republic. In addition, a Polish corridor is run to the sea between East Prussia and Brandenburg ending in the free city of Danzig. The latter is administered by the League but its foreign relations are controlled by Poland. Finally, the city and hinterland of Memel, ceded to the Principal Allies in the treaty, was handed over to Lithuania in 1924. About 3,500,000 former inhabitants of Germany are ceded to Poland or Lithuania in the east, of which rather less than one-third are German. Altogether, the total number of inhabitants ceded to the various Powers under the German Treaty falls not far short of 6,000,000. And this loss is probably a good deal less serious than the economic injury suffered by Germany in the loss of most of her iron and other minerals.

*Part IV. German Rights and Interests outside Germany.*—By articles 119-27, Germany ceded all her overseas colonies to the Principal Allied Powers. She thus lost in Africa the Cameroons (divided between France and the British Empire as mandatories); Togoland (to Great Britain as mandatory); Southwest Africa (to the Union of South Africa as mandatory); East Africa (to Great Britain and to Belgium as mandatories). These territories included some 18,000 Germans and between 12,000,000 and 13,000,000 natives. In the Pacific she lost the Marshall Isles (ceded to Japan as mandatory); Samoa (to New Zealand as mandatory); New Guinea (to Australia as mandatory); Nauru Island (to the British Empire as mandatory). She also renounced outright to Japan (art. 156-8) the peninsula of Shantung, a province Japan returned to China in 1921. In addition to all these cessions of territory, Germany lost all her state property, movable and immovable, in her colonies. She was further obliged to cancel all her valuable treaty rights, capitulations and concessions with countries like China, Liberia, Siam, Egypt and Morocco. An absolutely clean sweep was made of her transmarine possessions, properties, powers and rights. By article 438 even the property and stations of German missionaries are to be handed over to trustees, and the individual missionaries controlled or expelled from the mandated territories, at the will of the mandatory. The course of time will show how far the general disabilities inflicted on German overseas undertakings will cripple the transmarine state enterprise of Germany in future, and hamper her private traders and steamship lines, as well as her missionaries.

*Part V. Military, Naval and Air Clauses.*—The aim of these clauses was similar in all cases, to destroy the existing German fortifications and the *matériel* of war, and to maintain Germany permanently in an absolutely weak and crippled condition, so far as armaments went. The maximum of the German Army in future was to be 100,000 men, with stores of ammunition, guns, etc., in strict proportion. Beyond this figure all existing munitions, etc., were to be surrendered and destroyed and munition

manufacture henceforth restricted. Germany consented to abolish conscription and to adopt a system of long-period voluntary enlistment of at least 12 years for the men, and of 25 for the officers. Military training outside the army was forbidden, and the existence of a large general staff prohibited.

The naval clauses were almost equally drastic, and the German fleet was henceforth restricted to six battleships of the "Deutschland" type, six light cruisers, 12 destroyers, 12 torpedo boats (art. 181), in short, to a flotilla for coast defence, with the important proviso that submarines were absolutely forbidden. No new ships above 10,000 tons are to be built for replacement purposes. A voluntary long-period recruitment for the navy, on the lines of that of the army was provided. A complete demolition of naval works and fortifications within 50 km. of the coast was insisted on. The air clauses (art. 198-202) were the most drastic of all, for they absolutely prohibited naval or military air forces, and arranged for the total destruction of all military or naval air matériel. Inter-Allied commissions of control were provided for all these arms of the service, and their work was finally concluded in 1925. But the German armaments are still subject to supervision and inspection by the League.

*Part VI. Prisoners of War and Graves.*—This section is common to all the treaties and provides for the return of prisoners of war and for the upkeep and maintenance of graves. It calls for no special remark.

*Part VII. Penalties.*—This is the most disputable of all parts of the German Treaty, as it is the only one that has remained wholly a dead letter. It provides (art. 227) for the trial of William II. "formerly German Emperor, for a supreme offence against international morality and the sanctity of treaties." An international tribunal of five, with one member nominated by each of the Principal Allies, was to try this high-placed offender. The statement of the procedure to be adopted, and of the punishment to be inflicted, was judiciously vague. The project never came to anything because the Netherlands Govt., in whose territory the ex-Kaiser had taken refuge, refused to surrender him in accordance with the Allied request.

Articles 228-30 provided for the punishment before military tribunals of the allies of Germans "accused of having committed acts in violation of the laws and customs of war." Eventually a list of over 100 such criminals was drawn up, and their extradition demanded from Germany. Finally, about a dozen of them were tried in Germany itself by Germans and, though only a few were convicted, the Allied Governments decided to drop the matter, for extradition was impossible without fighting. In 1925 Field-Marshal Hindenburg, himself a "war criminal," was elected President of the Republic without any formal Allied protest.

*Part VIII. Reparation.*—This is among the most celebrated and important of the sections of the Treaty, and it was affected more than any other by outside and popular influences. The payments demanded were called "reparation" rather than indemnity, in deference to the principles of President Wilson, but it is hard to see how more money could have been demanded under any name. "The reparation chapter," as it is called, opens with the famous article 231, which is here given in full:—

The Allied and Associated Governments affirm and Germany accepts the responsibility of Germany and her allies for causing all the loss and damage to which the Allied and Associated Governments and their nationals have been subjected as a consequence of the War imposed upon them by the aggression of Germany and her allies.

Standing by itself, this article might be construed to mean no more than that Germany is rendered liable to pay by a *pro forma* admission of her guilt. But the *reply* of the Allies to Germany of June 16 must be considered an authoritative interpretation of their views. They admitted in it the binding character of the Wilsonian principles and interpreted the treaty as a whole, and therefore article 231 in particular, as fixing the War guilt on Germany. Article 232 defined (in connection with an annex) the categories of loss and damage under which Germany was liable. Among these was included pensions to civilians. This

seems clearly contrary to the definition given in the memo. of Nov. 5 1918, which has been quoted above. It would appear from the doubtful manner in which this question is handled in the covering letter and *reply* of June 16 that the Allies themselves were uneasy upon this point, and most impartial observers would now agree that this uneasiness was justified.

The remainder of Part VIII. is concerned with the ways and means of paying reparation, and a body, known as the Reparation Commission, was set up with very extensive powers. It appears that Mr. Lloyd George intended these powers to be used for the purpose of greatly reducing the ultimate liabilities of Germany, but the absence of the United States from the commission and the French influence upon it, together with English popular opinion, defeated this idea. The later course of reparation cannot detain us here, but the original proposals were greatly modified in execution. Mr. Keynes estimated at the time that about £2,000,000,000 was all that could be got out of Germany, and it is pretty certain that £3,000,000,000, or at most £4,000,000,000, represented the utmost they could have paid. The institution of the Dawes Scheme in 1924 put an end to the original reparation clauses and to the Reparation Commission.

The payments in kind provided for in article 236, and in various annexes, were based on sounder ground. They included, among other things, "the ton for ton, and class for class" replacement of Allied merchant shipping by German vessels. Great Britain benefited most under this head; France most by deliveries of coal and coal derivatives; Belgium by livestock.

*Part IX. The Financial Clauses.*—This section is largely technical, dealing with order of priority, with the meeting of special debts from special assets, currency questions, etc. It is closely connected with the "Reparation Chapter."

*Part X. Economic Clauses.*—The first section of this consists of articles 264-75, which deals with commercial relations, shipping and unfair competition, commercial treaties, etc. Much was attempted at the conference in the way of promoting internationalisation of rivers and canals and transport. It was even proposed to make raw materials free of tariffs throughout the world. But in the end the only practical gain was that the Allied Powers secured a "most favoured nation treatment" from Germany for five years, and adjusted various commercial treaties for this purpose.

Sections III.-VIII. (articles 296-311) provide for the regulation of enemy property, debts, contracts, etc. In the liquidation of German property in foreign countries the principle was adopted of giving the Allies power to confiscate the private property of German individuals in an allied country, and of crediting the sums obtained to the amount paid as reparation by the German National Government. In other words, the private property of German individuals held anywhere abroad was as liable to confiscation for reparation purposes, as if it had been German state property confiscated in a ceded colony. The German *Observations* to the Allies seem to admit that German private property held abroad could not be expected to escape altogether.

The Allies, in their *reply* of June 17, pointed out that they had had, as a result of the War, to take over foreign investments from their nationals, thus infringing on their private rights. They added: "the time has arrived when Germany must do what she has forced her opponents to do." It is quite true that, though private property was invariably respected in former wars, the advance of socialistic ideas and the conditions of modern warfare cause difficulty in applying strictly the doctrine of total immunity of private property. None the less, it appears that the demands of the Allies in this particular went much too far, as is evidenced by the fact that the powers thus given to the Allies have been exercised *in toto* nowhere except in France, that they have been only partially applied in Great Britain, and that they have been abandoned altogether in some countries, e.g., the Union of South Africa. Anyhow it constitutes a dangerous precedent for the future. It is notable as being one of the very few parts of the treaty with which "The Big Four" did not interfere.

*Part XI. Aerial Navigation.*—This merely arranges for full liberty of passage and facilities for Allied airships flying over Germany up till Jan. 1 1923.

*Part XII. Ports, Waterways and Railways.*—This is an important section, though a highly technical one. The aim was to secure international control over rivers which flowed through more than one country. This was a very extraordinary development from the doctrine laid down as to international rivers at Vienna in 1815. It was, however, affected by the desire to provide access to the sea for countries like Switzerland and Czechoslovakia. These were land-locked, though they are the source of rivers which end in the sea. International commissions were set up to control the Rhine,

Oder, Elbe, Niemen and Danube. The result is that Germany is in a minority in the control of three rivers regarded as typically German, the Rhine, Oder and Elbe. The Kiel canal is in effect internationalised to give freedom of access to all vessels of whatever country in peace and in war but, subject to this condition, is under German administration. Access to the sea is secured by providing free zones for Czechoslovakia in the harbours of Hamburg and Stettin. As regards international transport by rail, the clauses were mostly of a temporary nature; and were subsequently more defined by an international transport conference held at Barcelona in 1921 under the auspices of the League.

**Part XIII. Labour.**—This section marks the beginning of an attempt to build up an elaborate fabric of international Labour machinery, to provide for periodic international discussion, and to arrange for the representation both of employers and of working men. Three of the most distinguished of Labour representatives took part in its construction, Samuel Gompers of the United States, George N. Barnes of Great Britain, and Albert Thomas of France, the last-named becoming the permanent head of the International Labour Office. This is established at Geneva side by side, but not identical, with the League Secretariat. It is, in fact, the instrument set up to carry out article 23a of the Covenant by which the members undertook "to endeavour to secure and maintain fair and humane conditions for men, women and children, both in their own countries and in all countries to which their commercial and industrial relations extend." Though an integral part of the League, its character and organs are autonomous, which is not the case with the machinery set up to deal with health and transit questions. In the allocation of its finance the League has control, but not over the organs, of international Labour. The Labour office is controlled by the governing body of 24 persons, of whom 12 represent Governments; six are elected by employers' delegates to the conference and six by workers' delegates to the conference.

The general conference, or Labour Parliament, which has to meet once every year, consists of over 200 members, and is constituted as follows: Every member of the League is entitled to four representatives, of whom the state government nominates two, while a third is elected by the employers and a fourth by the workers of the state concerned. The conference has met annually, but has met with grave difficulties in the application of universal rules and standards. It is largely due to the conference, however, that the hours of labour in the West have been recognised as 48 per week, while most Eastern countries have been induced to adopt a 60-hour week standard, which represents a great advance upon anything previously done in this direction. The care with which questions of injury to workers, e.g., lead poisoning, are investigated and the publicity given to the deliberations is, however, a matter of the greatest importance (see INTERNATIONAL LABOUR OFFICE).

**Part XIV. Guarantees.**—Provision was made in the military clauses (see above) for the demilitarisation of the left bank of the Rhine. But a military occupation of Allied troops is also provided for. By article 428 the whole of this area, together with bridgeheads across the Rhine, is to be occupied for 15 years from the coming into force of the treaty (Jan. 10 1920). But it is provided in article 429 that there shall be a successive Allied evacuation of the three zones and bridgeheads into which the area is divided. That of Cologne is to be evacuated in five years, that of Coblenz in 10 and of Mainz in 15. These evacuations are not, however, to take place unless Germany faithfully carries out the provisions of the treaty as a whole. The Cologne evacuation was delayed from Jan. to Dec. 1925 on this account.

But the meaning of articles 429 and 430 appears to be that the Allies are only permitted to continue occupation if German conduct proves unsatisfactory. There does not seem any justification under the treaty for the action taken by the Allies as a whole, including Great Britain, in 1921, when areas in Germany beyond the bridgeheads were occupied. Still less would there appear to be any justification for the occupation of the German district of the Ruhr by the French and Belgians in Jan. 1923. This was not approved of at the time by the British Govt., and was subsequently declared by them to be in their opinion illegal in a note to the French Govt. (Aug. 1923). As a guarantee for the settlement of the Eastern frontier of Germany, as fixed at the peace, article 433 abrogates the Brest-Litovsk treaties between Germany and Soviet Russia and binds all German troops to evacuate territory beyond their new frontier.

**Part XV. Miscellaneous Provisions.**—This consists of a number of miscellaneous and technical matters which were accidentally omitted elsewhere. In so far as they are of any importance they are mentioned in connection with their appropriate subject above.

### III. SUMMARY

The German Treaty appears, when its various items are assembled together, to have been crushing and severe to a high degree. This result was partly due to the fact that the separate parts of the treaty were worked out by the different committees, and its cumulative effect not recognised when they were assembled together. It is due, however, more particularly to the fact that popular pressure was very great both on President Wilson, Mr. Lloyd George and M. Clemenceau not to make a lenient peace. Indeed, the scheme prepared by Mr. Lloyd George on March 25 (published as Cmd. 1614) shows sufficiently what his ideas were. And he only modified them when he received on April 8 the famous "round-robin" telegram of 370 M.P.'s, whereupon he abandoned his ideas of leniency.

At the beginning of June he again showed a tendency to moderation, but by this time President Wilson had made up his mind and all efforts were useless. M. Clemenceau was considered by some French organs not to have sufficiently supported the interests of France, and he could hardly have been more moderate, even had he so desired. The representatives of the British Dominions were generally in favour of severity, with the conspicuous exceptions of Generals Botha and Smuts, who strongly urged moderation. The chief defects of the peace, the procedure against the Kaiser and the War criminals and the inclusion of pensions to civilians in reparation, must be considered concessions to popular feeling rather than due to the deliberate judgment of the peace negotiators. The first two have been abandoned and the last greatly modified. The territorial concessions were carefully considered and may, with some effort, be brought within the bounds of "the Fourteen Points" and of the Wilsonian principles. As regards permanent maintenance of the new frontiers, the British Govt. has guaranteed these in the West by the Locarno Treaty, but they are evidently not prepared to give any special guarantees for the existing Eastern frontiers of Germany, though France has promised to support Poland and Czechoslovakia against Germany, if need arise.

The "guarantees" section of the Peace Treaty was carried out by the evacuation of the Cologne area and by the tacit abandonment of policies like the invasion and occupation of the Ruhr. The Property section of the treaty has been, in great part, modified or abandoned. No great diplomatic instrument has ever been so speedily modified, revised or altered, whether by tacit consent or by deliberate design. Two parts of the treaty alone have expanded and developed, the institutions set up by the international Labour organisation and by the League. President Wilson is known to have thought that other parts of the treaty were, to a large extent, temporary but that the League would be permanent and eventually prove the corrective and solvent of such difficulties as other sections had created. His prediction is now in a fair way to become verified.

**VERWEY, ALBERT** (1865— ), Dutch man of letters, was one of the leading figures of the revival of Dutch literature, called "The movement of 1880." He helped to found and from 1884-9 was one of the editors of the *Nieuwe Gids*; from 1894-1904 of the *Tweemaandelijksch Tijdschrift* and *De XXe Eeuw*, and from 1905-19 of *De Beweging*. In 1924 Verwey was appointed professor of Dutch literature in the university of Leyden. His anthology with commentaries of *Nederlandsche Dichters behalve Vondel* (1893, etc.) and his essay on *Poëtieter* and his circle *Het Testament van Poëtieter* (1908) are works of lasting value. Verwey, who held an honorary doctor's degree from the

University of Geroningen, translated into Dutch Shelley's *A Defence of Poetry* and Sidney's *An Apology for Poetry* (1891). In 1885 he issued an article on *The Sonnet and the Sonnets of Shakespeare*. See M. Uylert, *Albert Verwey* (1908).

**VESNIĆ, MILENKO** (1862–1921), Serbian diplomatist, was born as a Turkish subject in what was then the Sanjak of Novi Pazar, but made his way to Belgrade, where he was educated. After studying law he took his doctorate in Munich. He entered the Serbian diplomatic service in 1891, but soon left it to edit the Serbian law journal and became professor of international law at the High School (soon to become the university) of Belgrade. In 1893 he entered Parliament and was for a short time Minister of Education in the Grujić Cabinet. In 1899 he and other Radical leaders were charged with complicity in the attempt on King Milan's life, and though entirely innocent, he was sentenced to two years' imprisonment. After a year he was pardoned, resumed his professorship, and in 1901 became Minister in Rome. In 1904 he was appointed Minister in Paris, a post which he held, with short intervals of political work, until his death. He was one of the delegates sent by King Peter to negotiate the peace of London in 1913, and in 1919 was delegate of the new Yugoslav State at the Peace Conference. In 1920 Vesnić, who remained a staunch though level-headed Radical, was selected to fill the office of premier and remained in office for 12 months with a coalition cabinet. He died on May 15 1921.

**VETERINARY SCIENCE** (see 28.2).—There is no single cause to which the rapid development of veterinary science since 1910 can be attributed. Powerful influences have been at work, such as increasing national appreciation of the importance of agriculture as a whole, and recognition of the facts that animal husbandry forms one of the greatest divisions of agriculture, and that disease is intercommunicable between other animals and man.

**Public Health Service.**—The evolution of a public health service has been the means of allocating to animal disease an important position in schemes of preventive medicine. The indebtedness of veterinary science to some of the pioneers in public health is indeed great. The bearing which the animal food products, especially milk and meat, have upon the welfare of man has, during this period, become fully appreciated. In some countries, as North and South America and South Africa, animal by-products have become an extremely valuable national asset. In South America it is commonly said that when dealing with an animal body "nothing is lost but the breath."

The purity of meat and milk supplies has assumed a considerable importance. Inspection, carrying with it a guarantee of purity, has proceeded very rapidly in some countries. For example, in meat inspection alone Germany employed 1,180 qualified veterinary surgeons before the World War. In U.S.A. 800 were employed, and in the French Department of the Seine alone 67 were exclusively thus engaged in 1913. At this time the number engaged in Britain in the whole public health service, meat inspection included, was under 50.

In 1914 an investigation was made into the annual output of qualified veterinary surgeons in several countries in proportion to the population, with the following result: Denmark, 1 in 133,000; Germany, 1 in 210,000; France, 1 in 300,000; Sweden 1 in 275,000 (making provision for 1 in 183,000); United Kingdom 1 in 500,000.<sup>1</sup>

In 1921 Dr. Gerald Leighton, chief inspector (foods) for Scotland, instituted a searching enquiry into the question of meat inspection in Scotland. As a direct result, Scotland has secured by law a complete and uniform system of meat inspection in which it is definitely laid down that the only persons who are entitled to act as inspectors of meat with the power of passing judgment are: the medical officer of health (M.O.H.) of the district; a veterinary surgeon; a person who, not being the M.O.H. or a veterinary surgeon, has had not less than seven years' practical experience of the subject and has received a special certificate from the Board of Health. It was thus left to a medical colleague to secure this clear definition of the veterinary surgeon in relation to this important work.

<sup>1</sup> J. Share Jones, *Higher Agricultural Education in Wales*.

**University Developments.**—The rise of animal husbandry, animal industry and zootechny as divisions of veterinary science in countries such as North and South America, Switzerland and Rumania, led to the establishment of chairs in the universities of the countries mentioned, so that "in view of the constantly increasing importance of the production and conservation of food and clothing for mankind, especial consideration will be given to problems in breeds and breeding, feeds and feeding, care, management, exhibition, marketing and utilisation of all classes of livestock and their products" (University of the State of New York, 1920).

The isolation of one particular branch of education is now generally condemned. In those countries which were the pioneers in veterinary education there still exist huge veterinary institutions. But where a new veterinary institution has been established within recent years it has usually been founded in a university centre and as an integral part of the university. At present the movement towards the universities has become general. It is recognised that to be in the university as part of a national scheme gives education stability. In the United States, where veterinary schools of various kinds were very numerous, every school, with two exceptions, outside the universities or state colleges collapsed during the War. The utilisation of existing endowments in the universities for the advancement of veterinary education has proved of immense benefit, especially in such subjects as physiology, where complete departments with endowments already existed.

The universities have recognised veterinary science by granting veterinary degrees, which in some countries entitle the holders to practise, e.g., South Africa, Australia, Brazil and Japan. In other countries, as in England, the degrees are simply evidences of academic achievement and are not licences to practise. Although degrees of B.Sc., in which certain veterinary subjects could be taken, were already granted by the universities of London and Edinburgh, the University of Liverpool was the first British university to grant a full veterinary degree. This university has instituted degrees of bachelor, master and doctor of veterinary science (B.V.Sc., M.V.Sc. and D.V.Sc.).

**Research Institutes.**—Under the auspices of the Development Commissioners and their advisory committees, research institutes have been founded at London and Cambridge in England, and in Scotland, for the Animal Diseases Research Association. Scores of thousands of pounds have been disbursed, and in 1925 the commissioners enlarged their field of support by making a grant of £15,000 on a pound for pound basis to the University of Liverpool to provide more adequate buildings and equipment for teaching and research in the purely veterinary subjects of the university veterinary school, which is the only intramural school in a British university providing a full course of instruction for a veterinary qualification. The commissioners state that they "were impressed by the opportunities available at Liverpool for the scientific training of veterinary students . . . , that an increase in the supply of highly trained veterinary practitioners and research workers should justify itself by a diminution in the national losses from animal diseases, and that Liverpool could specially meet the needs of students from western English counties and from Wales." Sir A. D. Hall and Sir Thomas Middleton took a leading part in this movement.

**Outbreaks of Diseases.**—Foot-and-mouth disease has appeared periodically in Britain since 1910 and has been very prevalent on the European continent. The rapid spread of the disease in Britain during 1922–34 created consternation. The most severe outbreak in the history of the United States occurred in 1914–5. The cost to eliminate the disease was \$9,000,000, and 172,000 animals were affected. In 1914 Britain experienced the highest number of outbreaks of swine fever since 1896. In 1903 England was free from rabies and continued free until Sept. 1918. Between this date and 1922, 304 cases were reported. Western Europe was free from rinderpest from 1870 until 1920, when the disease was introduced into Belgium by zebus from America. The eradication of glanders in Britain was slowly but surely progressing until the year 1917. In 1918, however, 34

outbreaks were reported; but since that year the number of outbreaks again diminished, the figures in each successive year being 25, 15, 11, 4, 9, 3. On April 1 1923 it was decided to allow the importation of Canadian cattle into Britain. The decision of the royal commission was that Canadian cattle were free from foot-and-mouth disease, pleuro-pneumonia and cattle plague.

During the World War "horrible epizootics were disseminated throughout Russia by marching and retreating armies . . . Anthrax, glanders, rinderpest, contagious pleuro-pneumonia of cattle, foot-and-mouth disease, hog cholera, swine erysipelas, rabies, mange—each of them contributed to the disappearance of the comparatively dense animal population of Russia" (Podgalez). The result was that in 1922 Russia had slightly over one-third the number of horses it had in 1914, one-third the number of cattle, half the number of sheep and a quarter the number of pigs. In Sept. 1924 contagious bovine pleuro-pneumonia appeared in Japan, being imported with cattle from China. In 1925 the disease broke out again in Osaka and spread rapidly to the five neighbouring prefectures.

*Research.*—Strenuous efforts have been made to bring about a closer relationship between the workers in human and veterinary medicine. In Great Britain the Royal Society of Medicine has instituted a section for comparative medicine. The outstanding result achieved is the universal recognition of the bearing disease in the lower animals has upon disease in man. This is evident in most of the important researches of the period.

At the ninth international veterinary congress held at the Hague it was resolved: 1. That swine plague and hog cholera are different diseases. 2. That an active serum against foot-and-mouth disease is possible. 3. That the presence of negri bodies is the best diagnostic of rabies.

Amongst researches carried on over a prolonged period the following are deserving of mention: McFadyean and Stockman (England) on abortion in cattle; Buxton, Brown, Tocher and others (Scotland) on grass disease (they claimed to have demonstrated that grass disease in horses in Scotland was botulism); Jensen (Copenhagen) on bradspot; Gaiger (Scotland) on lamb dysentery; Thielér (South Africa) on protozoan diseases; Watson (Canada) on dourine (he utilised the complement-fixation method of diagnosis, through which it is claimed that the disease will be eliminated in a few years); Lignières (Brazil) on Pasteurellosis; Vallée (Paris) on foot-and-mouth disease; Magnusson (Sweden) on joint ill; Hall (U.S.A.) on the treatment of hookworms by carbon tetrachloride (which has since been applied to more than 12,000 human cases in the Fiji Islands with success). In 1909 Nuttall and Hadwen reported the successful use of trypan blue in canine piroplasmiasis and later suggested its use in piroplasmiasis of cattle.

Bruce and others concluded in 1910 that cattle may act as reservoirs of the virus of sleeping sickness. The final report of the Royal Commission on Tuberculosis (1911) claimed: (1) that there were three types of tubercle bacilli, (2) that animals and man can be reciprocally infected, (3) that a considerable amount of tuberculosis in children must be ascribed to milk infection, (4) that milk may be infective when there is no evidence, even on post-mortem examination, of tuberculosis of the udder. The intimate relationship existing between the disease in man and in animals is thus clearly established. At this time Siegel (Germany) claimed to have found the causal organism (a coccus) of foot-and-mouth disease; and McGowan (Edinburgh) and Ferry (Detroit) individually to have found the causal organism of canine distemper. The work of Twort and Ingram on the diagnosis of John's disease in 1912 was an outstanding merit. Leptospiiral jaundice was recognised in dogs probably for the first time by Courmont and Durand in 1917. A special committee was formed to investigate grass disease in 1918. In the following year the South African Govt's. select committee recognised the dipping scheme introduced by Watkins-Pitchford as an effective antidote for East Coast fever.

In 1922 Mellanby issued important results of his work on rickets in puppies carried out for the Medical Research Committee (London). In the same year *The Field* inaugurated a fund to assist research in canine distemper, and the Animal Diseases Research Association of Scotland received official recognition. The claim of Dahmen and Frosch (Berlin) to have discovered in 1924 the virus of foot-and-mouth disease has not been recognised. Interesting work on leptospiiral jaundice was done in England by Okell, Dalling and Pugh in 1925.

At the congress on the prevention of tuberculosis in London 1925, Professor Mølgaard, of the Royal Veterinary College, Copenhagen, gave an account of his experiments on animals leading to his discovery of the treatment of tuberculosis with

sanocrysin, and Professor Faber, of Copenhagen University, gave the results of the application of Mølgaard's method to a number of his human patients.

Remarkable progress has been made in veterinary science in Japan, and *The Journal of the Japanese Society of Veterinary Science*, edited by Drs. J. Muto and N. Nitta, is an excellent specimen of a first-class scientific journal. The three reports of K. Muto, director of the army veterinary school, Tōkyō, on the "Toxic Action of Carbon Disulphide"; Konno's work on the diseases found in young chicks in the Nagoya region and commonly called "kufun" or "ohri" in which he isolated the anaerogenic strain of *B. pullorum*, one of the causal agents of bacillary white diarrhoea of young chicks in Europe and America; the "Resistance of Erythrocytes of Healthy Domestic Animals," by Kohanawa and Kadono, of the Veterinary Institute, Hokkaido Imperial University, Sapporo; Ono's work at the laboratory of the animal quarantine station, Yokohama, on contagious bovine pleuro-pneumonia; and the work of Kohanawa and Ogura on cattle diseases in the Sapporo district indicate a breadth of view as well as high scientific capacity.

*Progress in Surgery.*—Considerable progress has been made in veterinary surgery. With the general adoption of anaesthetics, major operations are now widely practised. The operation on the laryngeal ventricle in the treatment of roaring, originally performed by the brothers Gunther, was reintroduced by Williams of Cornell and subsequently practised and popularised by many operators on thousands of cases with, it is claimed, a considerable measure of success. The most comprehensive work on roaring as a result of researches in the Argentine appeared in Spanish published at Buenos Aires. Imrie has done much to confirm the contention of Macqueen during the previous decade, that the abdominal cavity of the horse may be entered surgically almost with impunity, and Pugh has made an interesting contribution to thoracic surgery in the ox. In 1914 the first English work published on surgical anatomy of the horse was completed by Share Jones.

*Veterinary Science in War.*—In 1910 the strength of the British Army veterinary service was 160 officers and 218 others, or a total of 378. In 1917 there were over 1,200 officers and over 20,000 N.C.O.'s and men. Sixty-two men were killed in action and 358 died. Of the officers, 46 were killed in action or died of wounds or disease. Over 70 veterinary hospitals were established with accommodation for more than 100,000 animals. Much of the capital cost of hospitals in France was defrayed by the R.S.P.C.A. Most of the work in connection with the sale of horse-flesh for food was supervised by veterinary surgeons, and the funds thus realised were utilised to reduce the cost of the veterinary services in France.

During 1917 over 1,000,000 horses were on the strength at one time on all fronts, and of them 436,000 were in France. The average daily number of sick horses in that year rose to 110,000. The total dead wastage from Aug. 1914 to Nov. 1918 from all causes was over 500,000, of which 269,000 were in France. The weekly wastage in France was nearly 2% of the total strength. The total admissions to hospital in all theatres was 2,526,549, and of these 78% returned to duty. The mortality was worst in 1917, when the number lost was 145,475. The mortality in mules was only half of that in horses. During the War, the total number of camels admitted to hospital has been stated to exceed 60,000. One camel hospital averaged 1,103 camels daily, and the percentage discharged for duty was eight.

Cases of poll evil and quittor were common in horses and mules. It is stated that in one group of French hospitals 627 cases of quittor were dealt with in one day. Roarers were also numerous, and it is claimed that 80% were successfully treated. Specific ophthalmia appeared in 1916, and the number of cases rose to 1.4% of the strength. A point of great interest and importance is that glanders was not prevalent. This is due to the thorough manner in which the mallein test was applied. Mallein was ultimately produced at Aldershot at 2d. a dose.

In 1918 the corps was raised to the status of a Royal Corps. In 1917 Rainey claimed that the total wastage (from death, destruction, missing and casting) of horses and mules of the British forces at home and abroad during the year ending Dec. 1916 was 13% of the total. In peace time (1912) it was 14.8%, while the average annual mortality during the South African War, when there was no Army veterinary corps, was 55%. The names of Generals Sir Robert Pringle, Sir Frederick Smith, Sir Layton Blenkinsop and

Sir John Moore will be permanently associated with this extraordinary development.

**VICTOR EMMANUEL III.** (1869– ), King of Italy (see 28.28). When in 1915 Italy declared war on Austria, the King at once went to the war zone, remaining there until the Armistice, appointing his uncle Ferdinand, Duke of Genoa, regent of the kingdom to act in his stead. At the front he lived in a most unassuming manner at the "Villa Italia," near Udine, and after Caporetto near Padua, constantly visiting the trenches and the most exposed positions, as well as the military hospitals, and leading to a very large extent the life of the soldiers. His example was of great value as an encouragement, and he fully lived up to the tradition of his house that it has never known fear. He took the keenest interest in everything concerning the welfare of the men; but although nominally commander-in-chief he never interfered with the conduct of operations nor in the matter of appointments, and he allowed himself no more leave than was accorded to other combatants.

After Caporetto he multiplied his activities a thousandfold, and his proclamation of Nov. 19 1917 sounded like a trumpet call to the whole people. "As neither My House nor My People, one in spirit, have ever wavered in the face of danger, so even now we look adversity in the face without flinching. . . . Citizens and soldiers, be a single Army! All cowardice is treachery, all discord is treachery, all recrimination is treachery." After the Armistice King Victor Emmanuel returned to Rome on Nov. 14 1918, and had a triumphal reception. He visited Paris and the French front with the Crown Prince, and subsequently London.

At the time of the Fascist March on Rome (Oct. 28–30 1922), the Prime Minister, Sig. Facta, intended to proclaim martial law throughout Italy, and had actually prepared the decree and communicated it to the prefects and the Press; but the King, with that intuition that has never failed him on critical occasions, realised that its application would mean civil war, and refused to sign it and insisted on its immediate withdrawal. After the occupation of the capital the Fascist squadre before returning home marched past the Quirinal and paid homage to the King. The advent of the Fascist Govt. undoubtedly strengthened the prestige of the Crown, which the troubles of 1919–22 had seriously shaken. On May 26 1924 the King, accompanied by the Queen, the Crown Prince and Princess Mafalda, arrived in London to return the State visit to Rome of King George and Queen Mary. On June 7 he visited Madrid for a similar reason. In June 1925 the 25th year of his reign was celebrated throughout Italy with the greatest solemnity.

After the birth of his son and heir, Umberto, Prince of Piedmont (Sept. 15 1904), the King's family was increased by two

more daughters, Giovanna, born Nov. 13 1907, and Maria, born Dec. 26 1914. His eldest daughter, Princess Yolanda, was married on April 9 1923 to Captain Count Giorgio Calvi di Bergolo, and his second on Sept. 23 1925 to Prince Philip of Hessen. A keen scholar, and especially interested in numismatics, in 1910 and 1913 he published six volumes of his monumental work on the coins of Italy, the *Corpus nummorum italicorum*. After the War he made over to the nation a large number of royal residences in various parts of Italy, a heritage of the days when Italy was divided into a number of separate states, each with one or more royal or ducal palaces and villas. Among the most famous of these are the Pitti Palace in Florence, the villas of Castello, La Petraia and Poggio a Cajano in the neighbourhood of that city, the royal palaces of Milan, Venice, Genoa, Naples, the villa of Capodimonte near Naples and the "Neapolitan Versailles" at Caserta. Some of these buildings were turned into hospitals and homes for War victims, and others into museums.

(L. V.)\*

**VICTORIA** (see 28.37), a State of the Australian Commonwealth. Area 87,884 sq. miles. Its population increased from 1,339,102 in 1911 to 1,670,852 in 1925. Victoria is the most Conservative of the States of the Commonwealth, and up to the end of 1925 had had only one Labour Govt., which was appointed in June 1924 and defeated six months later. The farming interests (Country party) are well represented, and in the Coalition Govt. (Nationalists and Country party) which came into power in Nov. 1924, a representative of the Country party, Mr. J. Allan, was elected Premier. State-aided immigration was re-established in 1908 and a vigorous policy of close settlement adopted.

**Irrigation and Production.**—The Water Act 1905 practically nationalised every river and watercourse within the State, and between 1905 and 1925 over £13,000,000 was expended in works of irrigation and water supply. The area artificially supplied with water for domestic and stock use in 1923 was 13,440,000 ac. and the land under irrigation culture, chiefly along the valleys of the Goulburn and Murray rivers, was over 300,000 acres. After 1918, good progress was made in intensive fruit-growing at Mildura on the Murray. The total area under crops in 1924 was 4,682,144 ac., of which 2,705,323 ac. was under wheat. In the same year 86,888,000 lb. of butter was produced.

**Minerals and Manufactures.**—Deposits of brown coal and lignite of immense extent occur in various districts. In 1918 a commission was appointed by the Government to work the brown coal deposits at Morwell, to be utilised for the generation of electricity to serve Melbourne and other towns. The first generator was brought into operation in 1924 and is serving Melbourne. The manufacture of briquettes on a commercial scale is being undertaken. The State also operates the black coal deposits at Wonthaggi; the output of this field in 1923 was 418,394 tons, the total production for the State being 476,823 tons. The total value of the manufacturing output in 1924 was £113,921,000, of which factories connected with food and drink accounted for £33,760,000, and clothing and textile factories for £23,617,000. Great progress has been made in the manufacture of woollen goods, and in 1924 there were 27 woollen and tweed factories, the output being valued at £3,561,980. Melbourne, the capital, had a population of 885,700 on Dec. 31 1924. It is the second port in the Commonwealth. Of the other important towns, Ballarat and Bendigo owe their rise to the gold rush, and are now prosperous agricultural centres. Geelong is the next port to Melbourne and is also the centre of the woollen industry. (See AUSTRALIA.)

**VICTORY, ADVANCE TO.**—By the end of July 1918 the German offensive on the Marne and in Champagne, which had been intended by their high command to be decisive, had been brilliantly repulsed by an Allied counter-blow which had forced the enemy to evacuate the greater part of the ground gained and had almost cleared the Allied lateral railway communications from Paris eastwards. In the meantime, the British front about Amiens had not been idle. During May and June, the Australian Corps in Gen. Rawlinson's IV. Army had by constant raids and

minor operations obtained an almost complete moral mastery over the enemy, and had done much to encourage the harassed troops on other parts of the front. The following article describes the Allied advance, which began early in July 1918 and ended with the Armistice. It has been divided into six sections, namely: I. Battle of Amiens; II. Battle of Bapaume-Peronne; III. The Breaking of the Hindenburg Line; IV. Battle of Meuse-Argonne; V. The Offensive in Flanders; VI. The French Armies.

### I. THE BATTLE OF AMIENS

Towards the end of June, Rawlinson decided that an operation on rather a larger scale than the Australians had so far carried out had every chance of meeting with success. On July 4, six Australian battalions, working in close co-operation with some 60 tanks, together with four companies of the American 33rd Div., which was attached to the IV. Army for training, attacked on a front of nearly  $3\frac{1}{2}$  m., and with consummate ease and only small losses captured the ridge running from Villers-Bretonneux down to the Somme at Hamel. This operation gave greater depth and valuable positions for observation to the British line, while at the same time it denied to the enemy important observation over much of the Somme valley. It also showed that the German infantry was no longer the determined foe that it had been in 1916 and 1917, and that the enemy's defences were not formidable. The real significance of the operation was its evidence that on the IV. Army front a well organised attack, supported by tanks well trained beforehand to co-operate with infantry, would have every prospect of breaking through the enemy's defences, given the element of surprise.

On July 17 Rawlinson, to whose initiative the opening of the decisive Allied offensive was chiefly due, submitted proposals to Haig for an attack by the IV. Army on a front of approximately 16 m. from Moreuil to Morlancourt. The plan was at once approved by Haig, who, in response to a request from Gen. Foch that the British should take the offensive on the Lys front with a view to recovering the important position on Kemmel Hill, recommended that the venue for the British offensive should be changed to the Amiens front. To this proposal Foch assented with the modification that the French I. Army (Debeney) should attack on the southern portion of the front between Moreuil and the River Luce (about  $3\frac{1}{2}$  m.) shoulder to shoulder with the British IV. Army, both armies operating under the direct orders of the British commander-in-chief.

On July 28 Foch issued his orders. "The object of the operation," he said, "is to disengage Amiens and the Amiens-Paris railway, as well as to beat and push back the enemy between the Somme and the Avre. The offensive, covered on the north by the Somme, is to push forward as far as possible in the direction of Roye." The Amiens-Roye road was fixed as the dividing line between French and British, and Aug. 10 was to be the day of attack. This date was subsequently advanced to Aug. 8.

*Preparations for the British Attack.*—On July 26 orders were received that the preparations, which Rawlinson had already begun in anticipation of sanction being given to his proposed operation, were to be pressed forward with all speed. The essence of the whole plan was secrecy. Unless the existing conditions both as regards the state of the hostile defences and the absence of reserves could be maintained, success could not be guaranteed, and in consequence it was not until July 31 that divisional commanders even were told the true story of the operations, a false but adequate reason having been given for the preparations.

*Allied Forces.*—On Aug. 1 the strength of the IV. Army was seven divisions, one cavalry division, three tank battalions (about 110 tanks), 11 squadrons R.A.F. and 1,000 guns and howitzers. By zero hour on Aug. 8, this force had been increased to 13 divisions, three cavalry divisions, 12 tank battalions (about 456 tanks), 17 squadrons R.A.F., and over 2,000 guns and howitzers, of which 672 were "heavies." In addition, one division, retained in the hands of the commander-in-chief, was brought into the area, while two others arrived on the day of the battle. The cavalry, about 96 whippet tanks and part of the

artillery were moved by road, the remainder being brought up in some 290 special trains, 230 for personnel and guns and 60 for ammunition and material.

As the Canadian Corps, at the time in reserve near Arras, had not been involved in the desperate fighting earlier in the year, it was realised that wherever it was identified in the line by the enemy an early offensive would certainly be expected. The first problem, therefore, was to camouflage its move and to keep its presence secret up to the last possible moment. With this object a few Canadian units were moved into the line near Kemmel, whilst the remainder moved down to the Amiens front, though it was not allowed to take over its part of the front line until just before zero hour on Aug. 8. The task also of introducing and registering a very large number of guns without detection was no easy matter. All movements of artillery units and the formation of ammunition dumps had to be done at night. A strictly limited number of guns only were allowed to fire daily, nothing above the normal number of rounds being permitted.

*General Plan of Attack.*—The British front of attack was divided between the Canadian Corps (Currie, four divisions) from the Amiens-Roye road to the Amiens-Chaulnes Rly., 7,500 yd.; the Australian Corps (Monash, five divisions) thence to the Somme, 7,500 yd.; and the III. Corps (Butler, four divisions) thence to the river Ancre, 5,000 yd.; while to each corps a proportion of tanks was allotted. The task of the III. Corps was to form a defensive flank north of the Somme, whilst the French I. Army would carry out a similar task on the right of the Canadians. Three successive objectives were assigned at distances respectively of 2-2½, 3-5 and 6-8 m. from the original starting line.

Owing to the ample provision of tanks and the weakness of the enemy's defences a preliminary bombardment was unnecessary, the artillery, infantry and tank action commencing simultaneously at zero hour, up to which moment there was no divergence from the ordinary daily routine of trench warfare. With the French, however, the situation was different, as tanks were not available to assist them; and Debeney decided to bombard the enemy's defences for 40 min. prior to the infantry advance. The zero hour, 4.20 A.M., of the IV. Army advance synchronised with the opening of the French bombardment.

The hostile forces believed to be available to oppose the British were six divisions in first line with eight in reserve of the German II. Army (Marwitz), while in front of the attacking corps of the French I. Army were the two left divisions of the German II. Army and one division of the German XVIII. Army (Hutier). By the morning of Aug. 8 all preparations for the battle were complete, and the Allied forces, all unsuspected by the enemy, were about to enter upon the first stage of their continuous and victorious march to the Rhine.

*The British Attack, Aug. 8.*—At 4.20 A.M. (approximately one hour before sunrise) Rawlinson's IV. Army, under cover of a powerful barrage, debouched to the assault. Thick ground mist veiled the advance from the eyes of the Germans, who were completely surprised and overwhelmed with little resistance along nearly the whole front. The Canadian Corps attacked with three divisions in line, the 3rd, 1st and 2nd in order from the right. The Canadian 3rd Div., making light of the difficult task of debouching from a narrow bridgehead on the south bank of the River Luce, captured Hangard and Demuin, and by noon had carried its front forward to the second objective, between Mézières and Cayeux. The 3rd Cav. Div. then went through, followed by the Canadian 4th Div., but, after taking Beaucourt, was held up by machine-gun fire. The infantry on coming up succeeded in pushing forward, though they were unable that day to capture le Quesnel, the final objective.

The Canadian 1st Div. in the centre reached the first objective by 6.20 A.M.; but the Canadian 2nd Div. on its left only attained it an hour and a half later, having met with strong opposition at Marcelcave. At 8.20 A.M. the advance was resumed, the German machine-gunners putting up considerable resistance against the Canadian 2nd Division. The 1st Cav. Div. now sent forward

two brigades, one of which passed through the Canadian 2nd Div. and drove far into hostile territory, attaining the final objective in conjunction with the infantry, which followed up, clearing the ground in rear of the cavalry. By the end of the day's fighting the Canadian Corps had, with the exception already noted on the extreme right, carried out its appointed task, and captured over 5,000 prisoners and 161 guns.

*Progress in the Centre.*—The Australian Corps in the centre of the British attack had their 2nd and 3rd Divs. in the front line with the 5th and 4th in support, the 1st Div. being in reserve. The leading line, assisted effectively by the tanks, reached the first objective with little opposition. The 5th and 4th Divs. then continued the advance, pushing on beyond Bayonvillers and Morecourt, and occupied the second objective by about 10.30 A.M., when a brigade of the 1st Cav. Div. passed through towards Harbonnières and armoured cars raced forward down the Brie road, penetrating far into the enemy's back areas. Behind them, the Australians, throwing back their left to face the enemy on the north bank of the Somme, pushed forward their centre and right to the final objective just west of Vauvillers and Proyart, where they found the cavalry held up. During the day the Australians took nearly 8,000 prisoners and 173 guns.

North of the Somme the III. Corps had not met with the same measure of success. The plan had been disarranged by a local German attack near Morlancourt on Aug. 6, which forced back a part of the Allied line some 800 yards. In addition the terrain was not so suitable for tank manoeuvres as south of the river. The attack opened with the 58th, 18th and 12th Divs. from right to left. After the first objective had been gained, the further advance broke down against the resistance of the enemy holding the Chipilly spur, while further north the enemy counter-attacked and drove back the advanced attacking troops. Nevertheless, the III. Corps captured during the day nearly 2,400 prisoners and 40 guns.

The results of this most successful day's battle were the complete defeat and rout of 11 German divisions, a gain of ground to an average depth of six to seven miles on a front of eight miles, the capture of over 16,000 prisoners, 373 guns, several thousand machine-guns and quantities of ammunition and stores. Most important of all, the battle destroyed the last hope of German victory. "It was," says Ludendorff, "the black day of the German Army in the War. . . To continue would be a gamble. The War would have to be ended."

*The French Attack, Aug. 8.*—At 4.20 A.M., simultaneous with the British assault, the French bombardment of the enemy's position on the commanding ground in the angle between the rivers Avre and Luce opened, and at 5.05 A.M. the French infantry debouched to the attack. For this operation Debeney allotted three divisions of the XXXI. Corps, of which one division was given the task of capturing Moreuil. Despite a stubborn defence, the enemy was gradually driven back and Moreuil wood taken. This feature was of great importance, as its capture secured the flank of the British advance. At 9 A.M. the IX. Corps crossed the Avre, south of Moreuil, and extended the front of attack, which by the end of the day's fighting reached the general line Plessier-Fresnoy (excl.). Although the French attack did not quite reach its final objective for the day, its main task of securing the British flank was carried out, while some 3,000 prisoners and many guns were captured. The result also enabled General Fayolles, commanding the French reserve group of armies, to carry out his plan of extending the battle front further to the south on Aug. 9.

*Continuation of British Advance, Aug. 9-11.*—It was decided by Rawlinson that the IV. Army should on Aug. 9 continue its advance to the line Roye-Chaulnes-Bray-Dernancourt. The main attack was entrusted to the Canadian Corps which was to push southeast to the line Roye-Hallu, whilst the Australian Corps was to secure its left between the latter place and Méricourt, and the III. Corps to advance to Etinehem and form a defensive flank north of the Somme.

Early in the morning the Canadians captured the village of Le Quesnel, thus completing the capture of all the objectives

allotted to the main British attack for the 8th. During the day, assisted by cavalry, they advanced the line an average of five miles and halted for the night on a general line east of Rouvroy and Méharicourt. To the north the Australians reached Lihons Hill and captured Framerville after stubborn fighting. The III. Corps, north of the Somme, cleared the Chipilly spur and occupied Morlancourt. During the day six German divisions reinforced the front from neighbouring armies. On Aug. 10 and 11 the advance continued against ever stiffening resistance and hostile counter-attacks, eventually reaching the general line Le Quesnoy-Lihons-Raincourt, whilst north of the river the Etinehem spur was completely cleared.

*Pause in the Advance.*—It was now clear that to push the offensive further would lead to disproportionate loss with little corresponding gain. The enemy had reformed his front, shattered on the 8th, by fresh troops from other portions of the line, and had settled down on the edge of the area devastated in the Somme battles of 1916, where a maze of old trenches, wire and shell holes rendered defence easy and rapid advance impracticable. Rawlinson had engaged all his 13 divisions, units were tired and in need of a breathing space. He therefore decided to allow his troops a few days' rest while preparing for a renewal of the attack on Aug. 15. Units in the line were relieved and tired infantry and cavalry withdrawn into reserve.

*French Operations, Aug. 9-11.*—On Aug. 9, Debeney made an encircling attack, southeast and northeast with his X. and XXXV. Corps, his objective being Montdidier. The operation was completely successful, and though the garrison of the town managed to slip out the town was occupied and the rearguard captured on the morning of Aug. 10. In the meantime the XXXI. Corps to the north reached the line Pierrepont-Arvillers. By the night of the 11th it gained the western outskirts of Roye. On Aug. 10 Fayolles brought in the French III. Army (Humbert) on the right. Attacking on the front Courcelles-Gournay in the direction of Lassigny, it made an advance of an average depth of three to four miles. Next day the front was extended still further southwards, but, owing to the enemy's resistance becoming stronger, progress was thenceforward slow.

*British Operations, Aug. 12-21.*—Owing to the difficulty of reorganising the front of attack and of bringing up the guns, the attack arranged for Aug. 15 did not materialise and up to the 21st only local actions took place on the IV. Army front. British attacks alternated with hostile counter-attacks, the line after hard fighting reaching Damery-Lihons-Proyart-Dernancourt. On Aug. 17, Haig decided to transfer temporarily the centre of gravity of the British offensive to the III. and I. Army areas. The Canadian Corps was taken out of the line and the French I. Army took over the British front as far north as Lihons. During the period Aug. 8-21 the IV. Army had forced back the Germans to a depth of 12 m., had defeated or engaged with its own 13 divisions no less than 27 of the enemy's, had taken over 23,000 prisoners and 400 guns and had killed and wounded more than an equivalent number, at a cost to itself of some 27,000 casualties.

*French Operations, Aug. 12-21.*—During this period the French I. Army, which remained under Haig's command until the 16th, continued its advance in touch with the British right, while the French III. Army, whose advance was assisted by the French X. Army's attack east of the Oise, after a hard and determined defence succeeded in occupying Lassigny on Aug. 21. In the 12 days' fighting Humbert's army of seven divisions had driven eight hostile divisions from their strong vantage ground and had taken 5,000 prisoners and 100 guns.

*General Results of the Battle.*—The course and results of the fortnight's fighting may be summed up as follows: The three Allied Armies (British IV., French I. and III.), with 32 divisions, had attacked and defeated the German II. and XVIII. Armies of 42 divisions. The Allies had advanced to a depth of 6-13 m. on a front of 47 m. taking 40,000 prisoners and 600 guns. Most important of all, the Allied lateral communications between Paris and the north had been cleared, and a wide breach had been made in the German front, susceptible, as events were

to show, of being rapidly widened to either flank by further Allied attacks. A shattering blow had been dealt to the morale of the German Army and their high command, from the effects of which neither was destined to recover. The battle of Amiens was the first page in the story of the Allied victory of 1918.

## II. THE BATTLE OF BAPAUME-PÉRONNE

On Aug. 10 at the moment when Rawlinson's IV. Army was carrying all before it, Foch issued a directive to Haig in which it was enjoined that "enterprises by the British III. Army in the general direction of Bapaume and Péronne should be prepared as soon as possible." At the time the front of Byng's III. Army was held as follows: V. Corps (Shute, with three divisions) from the left of the IV. Army just north of Albert to Beaucourt, IV. Corps (Harper, with five divisions) thence as far as opposite Ablainzeville, VI. Corps (Haldane, with four divisions) thence to the army boundary south of Arras. Preparations were at once put in hand, the operations being timed to begin on Aug. 21, by which date the rapid advance of the IV. Army had been checked on the western edge of the old Somme battlefields of 1916.

**Attack by III. Army.**—On Aug. 21 a preliminary operation was carried out by the IV. and VI. Corps together with the left division of the V. Corps, in order to get within striking distance of the enemy's main defensive position along the Arras-Albert railway. This attack, which was entirely successful and resulted in the capture of some 2,000 prisoners, enabled Byng to spend the 22nd in bringing up his guns preparatory to the main attack on the 23rd, on which date a general advance on the whole army front, together with that portion of the IV. Army which was north of the Somme, was timed to take place.

On the 23rd, Byng attacked on a front of 16 m. from just north of Albert to the Cojeul. Though stubborn resistance was encountered, considerable progress was made, the objective being reached all along the line. The IV. Corps, in the centre, pushed forward to Bihucourt and Loupart Wood, while the VI. Corps captured Ervillers and established itself east of the Arras-Bapaume road in the vicinity of Boyelles. On the right the V. Corps, in conjunction with the III. Corps (IV. Army), pushed out its right and established itself on the hills overlooking the town of Albert just west of La Boisselle. During the day 5,000 prisoners and a number of guns were taken.

The advance was continued on the 24th and 25th, by the evening of which the IV. Corps had pushed forward as far as the line Favreuil-Mory, thus threatening the enemy's line of retreat from Bapaume. To the south the V. Corps, after capturing the Thiepval stronghold on the 24th, attained a general line west of Contalmaison and Courcellette. On the left the VI. Corps occupied St. Léger and Henin-sur-Cojeul but was held up in front of Croisilles.

**IV. Army Operations.**—The operations of the III. Army were closely supported by the IV. Army troops north of the Somme. On the 22nd, the III. Corps and left Australian Div. attacked on a front of 7,000 yd., reaching all its objectives to a depth of from 2,000 to 3,000 yards. In the afternoon a strong counter-attack developed against the III. Corps right division and much of the ground won earlier in the day was lost. During the next three days the advance continued in conjunction with the III. Army, and on the evening of the 25th the front had reached a general line along the high ground west of Suzanne-Mametz. South of the Somme the Australian Corps on the 23rd advanced up to the edge of the old Somme battlefield, capturing 3,000 prisoners and 23 guns.

**British Advance Continued.**—As a result of the critical situation caused by these operations, the German Higher Command ordered Von Boehm, commanding the group of armies between the Ancre and the Aisne to fall back to the general line Quéant-east of Bapaume-Péronne-Ham. This movement was carried out on the 26th and 27th.

On the 26th the V. Corps made a rapid advance, whilst the IV. Corps continued to swing round to the northeast of Bapaume, occupying Beugnâtre. On the evening of the 25th, the XVII. Corps (Ferguson) relieved the VI. and undertook the difficult task of dispossessing the enemy of his strong position in the vicinity of Croisilles. During the next week a stubborn defence was shown all along the front, which by the evening of Sept. 2 had reached the enemy's position on the line Morval-Haplincourt-Noreuil. During the 13 days' fighting the 14 divisions of the III. Army had engaged 23 hostile divisions, had taken from them 11,000 prisoners and many guns and had driven them back a depth of 8-13 m. on a front of 20 m., besides inflicting heavy losses in killed and wounded.

On the IV. Army front north of the Somme, the III. Corps together with the 3rd. Aus. Div. continued the advance in touch with the III. Army. South of the Somme the advance had been rapid, and on the evening of the 29th the river had been reached between Cizaucourt and Biaches, whence the line continued northwards to Combles. In view of the small prospect of success afforded by an attempt to force the strongly held river line south of Péronne, Rawlinson decided that the next operation must be a strong advance by the centre and left towards Nurlu in order to turn the river line. Before that could be done, however, the key to it, the dominating height of Mont St. Quentin, which commanded all the country to the north and west including all the river passages by which it could be approached, had to be captured.

**Capture of Mont St. Quentin.**—Although the operation which resulted in its capture by the Australians extended over only a few miles of front, they were of such importance to the general advance and so brilliantly executed that a description will be given in rather greater detail. On the 30th, a bridge head on the north bank of the river near Cléry was seized and by 4 A.M. on the 31st, the 5th Bde. (2nd Aus. Div.) had crossed over and by 7 A.M. had captured Mt. St. Quentin village, the right being held up in front of Anvil Wood. Shortly afterwards, a strong counter-attack developed and drove the British line back to the road on the southwest side of the village. As a result of the day's fighting the 5th Bde. of some 1,200 rifles had penetrated to a depth of 2,000 yd. and though reduced to only 600 rifles had held out on a wide front of 4,000 yd. against repeated and desperate counter-blows.

Next morning the 6th Bde. which had crossed the river the evening before, passed through the 5th Bde. and after a short bombardment stormed the village and wood and established itself on the height. Meanwhile the 14th Bde. (5th Aus. Div.) also passed through south of the 6th Bde. and brushing aside all opposition entered and occupied Péronne, only a small portion of the suburbs on the northeast remaining in the enemy's hands. Next day, the Australians occupied Allaines and the III. Corps St. Pierre Vaast and Vaux Woods. The line of the Somme had been turned, due, as a detailed account would show, to the brilliant initiative of every commander from the Army Commander to the section leader and to the magnificent fighting qualities of the Australian soldier. Between Aug. 22 and Sept. 2 the IV. Army of 9 divisions had engaged 23 of the enemy's divisions and taken 23,000 prisoners and many guns.

**Results of the Battle.**—Byng and Rawlinson's armies totalling together 23 divisions had defeated 46 German divisions. On a front of 28 m. they had advanced to a depth of 6 to 13 m., capturing 34,250 prisoners and 270 guns. The whole area of the Somme battlefields, which had cost the British five months of bitter fighting in 1916, had been reconquered in less than a fortnight; more than half the ground gained by the German spring advance had been recovered, the only good natural line of defence west of the Hindenburg system had been broken, and the shifting of the moral and material balance, in favour of the British and against the Germans, had become patent to the world.

## III. THE BREAKING OF THE HINDENBURG LINE

On Aug. 26 began the third stage of the series of offensive operations which formed the British share of the Allied advance to victory. This stage culminated on Oct. 5 in the capture of the last and strongest system of German defence, known as the Hindenburg Line. The first stage had been the attack by Rawlinson's IV. Army, assisted by the French I. Army under Debeney, eastwards and southeastwards from Amiens with the object of freeing the Paris-Amiens railway. In the second phase the British III. Army under Byng had extended the front of the attack northwards by a successful thrust towards Bapaume. The British I. Army under Horne was now to broaden the front of attack by driving eastwards from Arras with the object of turning the German positions on the Somme battlefields.

*Hindenburg Line Described.*—The Hindenburg Line consisted of a heavily wired system of trenches which ran northwards from St. Quentin to the village of Bantouzelle approximately parallel to the Schelde Canal. This portion was known to the Germans as the Siegfried Line. From Bantouzelle the main line of trenches ran northwest to Havrincourt, whence it turned north and followed the line of the Canal du Nord to Moeuvres. From Moeuvres it ran northwest past Quéant and Bullecourt to the original German front line east of Arras. Within this northern bend in the system, and covering the approaches to Cambrai lay several switch lines and defensive positions, the most formidable of which were the Drocourt-Quéant Line which ran in a northerly direction from the Hindenburg Line at Quéant and the Canal du Nord which passed by Moeuvres to the Sensée.

On the night of Aug. 25-6 the British line extended from a point northwest of Chaulnes where the right of the British IV. Army joined the left of the French I. Army, east of Bray, west of Bapaume to Croisilles, and thence northwest to the old British line, southeast of Arras. The IV. Army had the Australian and III. Corps in line; the III. Army, which extended northwards from a point east of Albert, had the V., IV., VI. and XVII. Corps. The I. Army front was held by the Canadian Corps and the VIII. and I. Corps, of which only the Canadian Corps, astride the Scarpe, was involved in the operations to be described. The German troops who were to bear the brunt of the impending blow were the left wing of Below's XVII. Army, the II. Army under Marwitz and the right wing of Hutier's XVIII. Army.

*The Offensive Launched.*—At 3:00 A.M. on Aug. 26 the Canadian Corps under Sir A. Currie attacked the German positions astride the Scarpe on a front of  $5\frac{1}{2}$  miles. The attack was carried out by the 2nd and 3rd Canadian Divs. and the 51st Highland Div. supported by 45 tanks and some 600 guns. The XVII. Corps of the III. Army co-operated on the right. The attack was a complete success. The Bavarian II. Corps and Bavarian I. Res. Corps were driven back through Wancourt, Guémappe, Monchy and Roeux, and by evening, in spite of strong counter-attacks, the Canadian Corps had established itself well to the east of those villages. On Aug. 27 the attack was continued by the same divisions, and Chérisy, Vis-en-Artois and Gavrelle fell into their hands. On the following day the Canadian 3rd Div. made further progress, and that night both divisions were relieved, the Canadian 2nd Div. by the Canadian 1st while the British 4th Div. relieved the Canadian 3rd. During the next few days considerable progress was made. This advance brought the British to within assaulting distance of the formidable trench system known to the Allies as the Drocourt-Quéant Line, and to the Germans as the Wotan Line. The capture of this system, would, it was anticipated, turn the whole of the German organised positions for some distance southwards. Preparations were put in hand to launch the attack on Sept. 2. The XXII. Corps took over the front north of the Scarpe held by the 51st Div. and relieved that division by the 11th.

*The Drocourt-Quéant Line Attacked.*—By the evening of Sept. 1 all preparations for the attack of the Drocourt-Quéant Line were complete. The main attack was to be carried out by the Canadian Corps, whose principal task was to break through the defences between Hendecourt and Saily. The XXII. Corps, also of the I. Army astride the Scarpe, was to secure the Canadian left, while the XVII. Corps of the III. Army, advancing on the right of the Canadians, was to capture the maze of trenches at the junction of the Drocourt-Quéant and Hindenburg lines, and turn the last named defensive position from the north. The XVII. and Canadian Corps were then to push on up to and if possible beyond the Canal du Nord.

The attack of the Canadian Corps was launched at 5:00 A.M. by the Canadian 1st and 4th and the British 4th Divs., supported by some 500 guns and 40 tanks, on a front of  $4\frac{1}{2}$  miles. All resistance on the first objective was speedily overcome, and by 9:15 A.M. the whole system of trenches on the front of the Canadian Corps was in the hands of the assaulting troops. On the XVII. Corps front, the attack was launched at the same hour and met with equal success. The 52nd Div. stormed the network of trenches at the junction of the two systems, and after heavy fighting succeeded in overcoming all resistance. The 57th Div., attacking north of the 52nd, pressed forward south of the Canadians, and by nightfall had swung round to the right and were threatening the villages of Quéant and Pronville from the north. The 63rd Div., which passed through to exploit the success, had heavy fighting during the afternoon, but by dark had reached the railway east of Quéant.

During the afternoon the Canadian Corps met with increased opposition, particularly from machine-guns on the British 4th Div. front, but by the evening an advance of some 3 m. had been made and British troops had captured Cagnicourt, Villers and Dury, and were approaching the outskirts of Buissy. Eight

thousand prisoners and many guns were captured, bringing the total captures on the I. Army front alone since Aug. 26 to 16,000 prisoners and 200 guns. In eight days the 10 British and Canadian divisions employed by the I. Army had defeated 13 German divisions and driven them back 10 m., out of all their organised positions in front of Cambrai. Troops of the III. and IV. Armies prolonged the attack southward on Sept. 2, and substantial progress was made, though the fighting was severe.

The results of this most successful operation became obvious at once, as on the night of Sept. 2-3 the Germans fell back to the line of the Canal du Nord from Péronne to Hermies. The following day they commenced to withdraw from the Somme, south of Péronne, and by the night of Sept. 8 they were back on a line Vermand (6 m. west of St. Quentin)-Epehy-Havrincourt and thence along the east bank of the Canal du Nord to the Sensée.

*Preparatory Operations Continued.*—The Canal du Nord, behind which the German forces facing the I. Army and left of the III. Army had now established themselves, was far too strong a natural position to warrant attack without very careful preparation. The next three weeks were therefore devoted by the British forces on this front to the organisation of an operation which eventually took place on Sept. 27. South of Havrincourt the German main line of resistance was the Hindenburg Line, but strong forces were still occupying advanced positions in the trenches which formed the old British and German lines prior to the German offensive in March 1918. These had to be captured before the Hindenburg Line itself could be assaulted, and to this end operations were undertaken by the British III. and IV. Armies.

On Sept. 12 the III. Army attacked with the IV. Corps and the VI. Corps on a 5 m. front in the neighbourhood of Havrincourt Wood. A considerable advance was made and the villages of Trescault and Havrincourt were captured. Meantime the IV. Army had continued to press the German withdrawal, and between Sept. 11 and 17 the line had been pushed forward at several points. On Sept. 18 a much more extensive operation was undertaken, in which the IV. Army in conjunction with the III. Army attacked the German forces on a 17 m. front from Holnon to Gouzeaucourt. The French I. Army co-operated on the right. The final objective of the main attack was the old British outpost line running past Pont Ruet, west of Bellicourt, Bony and Vendhuile. It was not intended that this final objective must necessarily be reached on the first day—and in fact it was not reached until after several days of very severe fighting.

At 7:00 A.M. on Sept. 18 the IV. and III. Armies attacked in heavy rain. The attack was supported by 23 tanks and 978 guns, and in some sectors dummy tanks were used with considerable success. The IX. Corps advanced on the right with the 6th and 1st Divisions. The first objectives were taken at 9:00 A.M., but the 6th Div. was checked at Holnon and west of Fresnoy. The 1st Div. was more successful, but was unable to reach Pont Ruet, and both divisions suffered severe casualties. The Australian Corps had very heavy fighting, particularly in and about Le Verguier, and was held up in front of its final objective till dusk. During the night a successful attack was made which completed the operation on the Australian front.

North of the Australians the III. Corps attacked with the 74th, 18th, 12th and 58th Divs., and met with very stubborn resistance. Ronssoy was captured by the 18th Div. and Epehy by the 12th and 58th Divs., but little progress was made beyond these places. The V. Corps of the III. Army continued the front of attack to the north and all divisions made considerable progress, though it was not found possible to take Gouzeaucourt on this day. Minor operations were undertaken during the succeeding week, which resulted in the capture of Gricourt and Pont Ruet by the IX. Corps, and by Sept. 26 the British line had been advanced to a position from which the attack on the main Hindenburg system could be launched. In this last series of operations 15 divisions of the British III. and IV. Armies had driven back 29 divisions of the German II. and XVII. Armies into the Hindenburg defences, and inflicted on them a loss of 12,000 prisoners and 100 guns.

*The Storming of the Hindenburg Line.*—All was now ready for the great effort to break through the Hindenburg Line. The strategic plan decided on by Marshal Foch and the Allied Commanders-in-Chief involved the launching of four convergent and practically simultaneous offensive operations. The Americans were to attack west of the Meuse in the direction of Mézières. The French offensive, also against Mézières, was to be launched west of the Argonne. The British were to break through the Hindenburg Line between St. Quentin and the river Sensée and advance on Maubeuge, while an Allied force (British, French and Belgian) under the King of the Belgians, was to attack in Flanders in the direction of Ghent. The results to be obtained from these offensive operations depended in no small degree on the success of the British attack in the centre, where a threat to the German vital systems of lateral communication would re-act on their defences elsewhere. It was here, too, that the German system of defence was most highly organised, and here success or failure might be expected to produce the greatest moral effect, both from the military and political points of view.

In accordance with the above general strategic plan the French and Americans attacked on Sept. 26; the British offensive commenced on the 27th, and the Allied attack in Flanders was launched on the 28th. Haig's plan was to strike first with his left wing in the direction of Cambrai, while the right wing, which was faced by the more formidable defences, was to attack later after a very heavy preliminary bombardment. It was hoped that any success obtained by the left wing would draw off the German reserves, and deceive their higher command as to the point where the main blow was to fall.

A very heavy bombardment was opened on the night of Sept. 26-27 on the front of the British I., III. and IV. Armies, and at 5:20 A.M. on the 27th four corps attacked on a front of 13 m. from Gouzeaucourt to the neighbourhood of Sauchy Lestrée. On the northern flank the Canal du Nord was too formidable an obstacle to be carried in face of opposition, and consequently the plan was conceived of crossing on a comparatively narrow front, and then of turning the line of the canal further north by a divergent attack from the point of crossing. This difficult manoeuvre was most successfully carried out. On the right the 5th and 42nd Divs. of the IV. Corps established and held a strong flank between Beaucamp and Ribecourt. On their left the VI. Corps advanced with the 3rd and Guards Divs., and captured Ribecourt and Flesquières, while the 62nd and 2nd Divs., passing through, continued the advance in the direction of Marcoing. Further north the 52nd and 63rd Divs. of the XVII. Corps forced the passage of the canal and, after heavy fighting, established themselves in Graincourt, and the 57th Div., in close co-operation with the Canadians, reached Anneux.

On the I. Army front the Canadian Corps attacked with the Canadian 4th and 1st Divs., and in the half light of dawn stormed the canal on the line Moeuvres-Sains-Marquion. With irresistible impetus the Canadian 4th Div. pushed on to Bourlon village and wood where the Canadian 3rd Div., taking up the attack, advanced towards Fontaine Notre Dame and Saily. On the left the Canadian 1st Div. was equally successful, and having captured Sains and Marquion, advanced rapidly towards Haynecourt and Sauchy Lestrée, while the British 11th Div. passed through and captured Epinoy and Oisy-le-Verger. Meanwhile the 56th Div. of the XXII. Corps crossed the canal, west of Sauchy Lestrée, cleared that village and advanced on Palleul. By the evening of Sept. 27 over 10,000 prisoners and 200 guns had been taken. As soon as the crossings of the canal were secured the British and Canadian engineers began to construct the necessary bridges, and in spite of heavy artillery fire completed their task with remarkable speed, and contributed in no small degree to the success of the operation.

On Sept. 28 the advance was continued and Gouzeaucourt, Marcoing, Noyelles, Fontaine Notre Dame, Saily and Palleul were taken, and a footing was obtained on the east bank of the Schelde Canal at Marcoing. At 5:50 A.M. on the morning of Sept. 29, after a preliminary bombardment lasting over two days, in which some 1,600 guns were employed, the British IV.

Army advanced to the attack, covered by an intense artillery barrage. The front of attack extended from Holnon to Vendhuile, a distance of about 12 miles. On the right the IX. Corps met with complete success. The 1st Div., advancing south of the bend in the Canal at Bellenglise, established a flank facing southeast from Gricourt to the Le Tronquoy tunnel. The 46th Div., which was faced by a most formidable task, advanced with the greatest gallantry, and with the assistance of rafts, mats and even life-belts, stormed the canal at and north of Bellenglise and rushed the German trench system west of the canal. The German defences here faced south, and the British troops swung to the right and took them in flank and rear, capturing many prisoners and guns. By 3:00 P.M. the 46th Div. had broken through the Hindenburg Line to a depth of 3 miles, routed four German divisions, and taken over 4,000 prisoners and 70 guns at the small cost of 800 casualties. The 32nd Div., passing through, completed the capture of the Hindenburg Reserve Line, and by nightfall had taken 800 more prisoners and 20 guns.

*Work of the American Corps.*—On the left of the IX. Corps the American II. Corps had been superimposed on the Australian Corps. The task of the American troops was to break through the Hindenburg Line at and north of Bellicourt, where the St. Quentin Canal passes through a tunnel. The Australian 5th and 3rd Divs. were then to take up the attack and advance on more distant objectives. The Americans advanced with the greatest gallantry, but owing to inexperience and impetuosity they omitted to secure the captured ground as they advanced. The German troops, swarming up out of their dug-outs and shelters in the tunnel were consequently in position to oppose the supporting Australian divisions as they came up and it was only after very heavy fighting that the Australian 5th Div. on the right finally succeeded in reaching the Hindenburg Reserve Line about Nauroy. The Australian 3rd Div. following up the Americans could make but little headway and was finally checked in front of Bony.

On the left the III. Corps carried out their task of securing the left flank of the IV. Army. On the same day the III. Army achieved an important success by securing the canal crossings at Masnières and northward as far as Cambrai, while the I. Army front was advanced northwest of that town. On Sept. 30 the break in the Hindenburg system was widened by the capture by the IX. Corps of Thorigny and Le Tronquoy, and on the same day the Germans abandoned Villers Guislain and Gonnelleu. On Oct. 1, in co-operation with the French I. Army who occupied St. Quentin, the IX. Corps took Levergies and the Australians captured Joncourt, Estrées and Bony. The III. and I. Armies also achieved important successes. During the first week in Oct. the XIII. Corps relieved the III. Corps north of the Australians and a series of successful minor operations were carried out on the fronts of all three armies, and by Oct. 5 the whole of the rearward lines of the Hindenburg system were in British hands.

*Results of the Offensive.*—During this nine days' battle 30 British and two American divisions had broken through the last and most powerfully organised system of German defences, had overwhelmed 39 German divisions and captured 36,000 prisoners and 380 guns. The effect of the British victory was decisive on the subsequent course of the campaign, and though there was still to be hard and bitter fighting before the termination of hostilities on Nov. 11, only natural obstacles such as woods, rivers and villages now lay between the British Armies and their objective at Maubeuge.

#### IV. THE BATTLE OF THE MEUSE-ARGONNE

In its main outlines the plan of the Meuse-Argonne attack was agreed upon in a conference between Marshal Foch, General Pétain, and General Pershing at Bombon, on Sept. 2 1918. The decisions of this conference were embodied in a general directive

issued by Foch and elaborated by Pétain into precise orders for the two armies concerned—of Pershing and Gouraud.

**Allied Plans.**—The general objective named for the combined attack on the front was Mézières. The American I. Army was to attack on the front from the Meuse to the Argonne and the French IV. Army to attack from the Argonne to Suippe. The direction for the attack of the two armies was Buzancy-Mézières, but the first objectives named were the Hindenburg Line on the front Briulles-sur-Meuse-Romagne-sous-Montfaucun-Grandpré. The American attacking troops consisted of three army corps of three divisions each in the front line and three divisions in reserve. This force was strengthened by the addition of 180 French aeroplanes, 239 French tanks, and 1,712

passing through the woods in its front, and was unable to take Montfaucun although the III. Corps had passed beyond it on the right. On the second day Montfaucun was gained and the attack went forward, but not so far as had been planned. On the third day, Sept. 28, still less advance was made in the centre and not what was hoped for on the left.

By this time the German reserves from outside the sector began to pour in and by the fourth day, having nine divisions in the line, the Germans made strong counter-attacks, which were partially successful in regaining lost ground. The German artillery was also greatly increased and from the favourable flanking artillery position on the heights east of the Meuse and in the Argonne forest hampered the advance of the American troops, in what had now become an advanced salient in the American line between the Meuse and the Aire rivers. The weather for the first three days had been favourable, but on the 28th drizzling rain set in, which added to the difficulties both of the tactical handling of troops and of their supplies. The reconstruction of roads across no-man's land has been found especially difficult on the front of the centre corps, on account of the depth of the shell-battered zone created by years of intensive fighting.

**Offensive Renewed, Oct. 4.**—West of the Argonne the attack of the French IV. Army had not been successful in making any appreciable advance and American reserves were called for to reinforce the French IV. Army, as well as to replace tired divisions in the I. Army for a general renewal of the offensive on Oct. 4. This renewal of the attack was successful on both flanks of the Argonne. On the west the French IV. Army captured Blanc Mont, while east of the Argonne the right of the I. Corps gained an advance of 10 km. on the right bank of the Aire, an advance exploited three days later by bringing a flank attack on the upper Argonne from the east, which resulted in the capture by Oct. 10 of the entire forest, and enabled the French and American Armies to connect their flanks through the pass of Grandpré.

The failure of the I. Army to gain its objectives on the western half of the Meuse-Aire plateau in its attacks of Oct. 4 made it clear that a broader base was required to push the attack beyond the main Hindenburg Line, and that the possession by the Germans of the heights east of the Meuse afforded them too favourable artillery positions and observation posts to make possible an extended advance west of the Meuse. Accordingly on Oct. 5 Pétain placed at the tactical disposal of the I. Army the French XVII. Corps, at the time passively holding the line east of the Meuse, and directed that, reinforced by some American divisions, it should be called upon to gain the line Dun-sur-Meuse-Damvillers. This attack was made on Oct. 7, coincident with a renewal of the attack on the west. By Oct. 10 the I. Army was, in general, up to the rearmost carefully prepared German positions in this region, known as the Kriemhilde Stellung. On Oct. 11 Pétain called for a renewal of the attack on both banks of the Meuse with the same objectives as before on the east bank, but with the breaking of the Kriemhilde Line and the capture of Buzancy as the objectives on the west bank. This attack was carried out on Oct. 14 and resulted in small material gains, including the Côte Dame Marie, Cunel and Romagne-sous-Montfaucun.

**Preparations for Final Attack.**—The troops by this time were well worn and for the remainder of the month the I. Army had of necessity to limit itself to local operations and to preparations for a systematic renewal of the offensive. On Oct. 12 the I. Army front, which had hitherto extended to the east to the Moselle, was divided into two army sectors, and on the 16th General Pershing transferred the immediate command of the I. Army to Lieutenant-General Liggett, and exercised supervision, as group commander, of both armies.

On the German side there was no lack of appreciation at either Army or General Headquarters of the threat which the American attack constituted. Von der Marwitz declared to his army, on Oct. 1, "It is on the firm resistance of the Verdun front that depends the fate of the great part of the Western Front, perhaps even of our nation." Hindenburg wrote in his memoirs:

French guns and mortars. Of the American troops in the front line only one division was regular, and six of the remaining eight divisions lacked any previous battle experience.

**German Forces Engaged.**—The German positions between the Meuse and the Argonne were naturally strong and had been strengthened by every possible artifice. Vauquois, a fortified hill east of and overlooking the Aire valley, was regarded as an impregnable fortress, and Montfaucun, dominating the whole plateau, afforded not only a strong defensive position, but observation and command posts which greatly aided in controlling the defence of the entire sector. German troops in the line on the front of attack consisted of only five divisions, four of them of inferior quality and the fifth, a Guard division, much worn from intensive fighting further north and sent to this supposedly quiet sector for rest. Among the German divisions immediately in reserve only one was rated first-class. Thus the German infantry actually in line was out-numbered about four to one, since the American divisions had twice the infantry strength of the German divisions, and a decisive artillery and air superiority.

Prior to the attack General Pershing caused various feints and ruses suggestive of coming American attacks to be employed in the Luneville sector east of the Moselle as well as in and south of the Vosges Mountains. This had served to distract the attention of the German General Staff and led it to expect an attack to the east or south rather than west of the Meuse. The real attack, consequently, had the advantage of being almost a complete surprise.

**First Attack: Sept. 26.**—Following an artillery preparation of three hours, the attack was begun at dawn on Sept. 26. On the first day the attack progressed well. The I. Corps on the left stormed Vauquois, reached its objectives in the Aire valley, and even made sensible progress in the Argonne forest. On the right the III. Corps crossed the difficult Forges brook, and also gained its objectives, but in the centre the V. Corps was held up in

"It was plain that the situation could not last. Our armies were too weak and too tired. Moreover the pressure the American masses were putting upon our most sensitive point in the region of the Meuse was too strong."

During the month of Oct. the German Army, pressed at all points, had used up nearly all its available reserves of fresh divisions, and no longer had means of replacement of depleted or exhausted units on the front line. The result was that the carefully prepared general attack on Nov. 1 broke through the enemy's line at all points and henceforth it was a case of rapid pursuit, with occasional rear-guard actions until the Armistice on Nov. 11. The chief preoccupation on the Allied side during this pursuit was holding the troops in leash in their sectors and determining who should have the honour of first entering important towns such as Sedan. The main line of the Carignan-Sedan railway, the real objective of the Meuse-Argonne attack, was brought under artillery fire on Nov. 3, and reached by the I. and V. Corps on Nov. 7, while the III. Corps had by the same date forced the crossing of the Meuse and advanced 10 km. to the north and east.

The I. Army during the Meuse-Argonne operation had employed 22 American and four French divisions. Of the American divisions 12 were engaged on other fronts during part of the

time. On the German side in addition to the five divisions originally in the sector 38 divisions had in the course of the battle been put into the line. The maximum strength of the American troops engaged at one time was 896,000, their losses were 117,000 killed and wounded, their captures 26,000 prisoners and 846 guns.

## V. THE OFFENSIVE IN FLANDERS

By the end of Aug. 1918 the initiative in operations had been definitely lost by the Germans. Strengthened by American co-operation, Marshal Foch planned a triple attack in which Franco-American forces were to attack on both sides of the Argonne: the main British forces to break through the Hindenburg Line; the Belgian Army with some British and French troops to operate in Flanders. The three échelons were to move off on Aug. 26, 27 and 28, respectively, at intervals of 24 hours.

**Allied and German Forces.**—The Flanders Army Group, created Sept. 11, and placed under the command of King Albert, included the Belgian Army of 12 infantry divisions and one cavalry division; the British II. Army of 10 infantry

divisions; and, later, the French VII. Corps and II. Cav. Corps, with a considerable reinforcement of artillery. The Commander-in-Chief of the Allied armies decided that the first operation should have as its object the occupation of the Clercken hills heights, the forest of Houthulst and the Passchendaele-Wytschaete-Comines ridge. From these points a second offensive delivered in the direction of Roulers-Courtrai might be expected to bring about the evacuation of the Belgian coast and the industrial region round Lille.

The German IV. Army (Gen. von Arnim), lying between the sea and Armentières, had 16 divisions: the Marine group (2nd Marine Div., 38th Landwehr Div. in line, 1st Marine Div. in reserve); the Guards Res. Group (13th Res. 11th and 12th Bav. Divs. in line, 23rd Div. in reserve); the X. Res. Group (236th and 8th Divs. in line, 187th in reserve); and the Guards Group (11th Res. and 56th Div.). The last two of these groups were facing the British, the first two the Belgians. Four divisions were resting: the 16th at Bruges, the 3rd at Thourout, the 16th Bavarian at Iseghem, the 52nd Res. at Courtrai. The marine divisions were fresh and at normal strength but the other divisions had only 60 to 70 men to a company. The disposition of the defence comprised three positions, the zone of the shell-holes and "pillboxes" of the 1917 battle; the *Flanders II Stellung*, marked on the crest by Zarren—Westroosebeke—Passchendaele; and the *Flanders I Stellung* between Handzaeme and the west of Roulers.

*Allied Attack: Sept. 28.*—At 2:30 A.M. on Sept. 28, 1,800 guns opened fire; and after a bombardment lasting three hours, nine Belgian divisions—of whom two were in the second line—proceeded to the attack on a front of 7 m., extending from Lake Blanckaart to St. Jean, near Ypres. Twenty minutes later, four British divisions (the 9th, 29th, 35th and 14th) attacked between this point and St. Eloi without any artillery preparation. In two hours the zone of the shell-holes had been crossed under a heavy downpour of rain, and by evening the Allied troops had advanced some 5 m. over a sea of mud. The Belgians had carried all before them, taking the Houthulst forest and Passchendaele, and the British had taken Becelaer, Kruiseik and Zandvoorde. On Aug. 29, in spite of counter-attacks by the resting German divisions which had been thrown into the battle, the Belgians had carried Dixmude, Clercken, Stadenberg and Westroosebeke, the latter points being severely contested. Fighting side by side in the best spirit of camaraderie, the Belgian 8th Div. and the British 9th took possession of Moorslede and Dadizele. Success became complete through some minor engagements on Aug. 30. The total advance was one of eight miles. The whole of the Flanders crest was taken and 9,000 prisoners and 300 guns were captured.

*Second Advance Oct. 14.*—After a respite of a fortnight in which to organise the roads and transports over the zone of the craters; the Flanders Army Group commenced a second battle, on Oct. 14, to force the *Flanders I Stellung*. On the German side, six new divisions were holding the line (the 3rd, 16th, 32nd, 36th Res. Ersatz Guard, and the 1st Bavarian Res.). Three other divisions (the 3rd Landwehr, 6th dismounted Cav., and 207th) were held in reserve. On the Allied side, four French divisions, with two Belgian divisions to the north and three Belgian divisions to the south, went forward to the attack at 5:00 A.M. on a front of 11 m., without artillery preparation. The French took possession of Hooglede and Roulers, the Belgians of Cortemarck and Winkel St. Eloi. On the following day the Belgian 3rd Div., having cut the Ersatz Guard Div. to pieces, gained another 3 m. to the east, reaching Bavichove, northeast of Courtrai, while the British II., V. and XIX. Corps, who were flanking the movement, facing south, threw the Germans back to the Lys after hard fighting, advanced 6 km. and approached Courtrai.

*German Retreat to Ghent.*—On the morning of Oct. 16 the enemy began to retreat on the front from the sea to the Lys, being completely exhausted. The Allies followed in hot pursuit. On the 17th, the Belgians entered Ostend, the British entered Courtrai and Lille and the French drew near to Thielt. As had

been foreseen, Von Arnim, once his centre was broken, abandoned both the coast and Lille, and retired behind the canal that connects Maldegheem and Deynze and is prolonged by the Lys and, further south by the Schelde between Avelghem and Tournai. The Allies got in touch with this new position on the 20th. Ten days later, after a new French division and two American divisions had arrived to reinforce the Flanders Group, King Albert attacked the position, directing the principal effort between the Lys and the Schelde. Complete success crowned this enterprise. Overthrown at Anseghem and Kerkhove by the British II. and XIX. Corps, and at Cruyshautem by the American 37th Div., the enemy was forced to retire behind the Schelde and make his way up stream to Ghent and beyond the Terneuzen canal to the north of that city.

In conformity with Foch's orders an attack against this line was prepared for Nov. 11; the Armistice, however, rendered this fourth battle unnecessary. Since Sept. 8 the Flanders group of armies had advanced 65 km. and had captured 20,000 prisoners and 500 guns. The Belgian Army had fought with distinction. Their casualties amounted to 1,000 officers and 29,000 men.

## VI. THE FRENCH ARMIES

In the course of the general offensive extending from Sept. 28 to Nov. 11 1918, all the Allied forces were included in a combination of convergent actions, controlled by the High Command and designed to turn the enemy out of his positions or outflank him.

*Disposition of Forces.*—Speaking generally, the centre group of French armies (Gen. Maistre) operated from south to north in liaison with the American forces through its right (IV. Army), while the reserve group (Gen. Fayolle) operated from west to east, being in touch with the British forces through its left (I. Army). But in the centre of the French disposition Gen. Pétain specially combined the action of the two groups to fight the battle of the Serre. The V. and X. Armies attacked the "Hunding" position from the front while the right of the I. Army outflanked it from the north. At the extremities of the battle line of the Allied armies French forces were again to be found: on the one hand, in Belgium; on the other, in Lorraine, where the eastern group, under Gen. Castelnau, was preparing the offensive arranged for Nov. 14.

Between July 1 and Sept. 15 the French had lost 7,000 officers and 272,000 men. Their divisions showed an average deficit of about 2,000 men and all available reinforcements had been embodied. But Marshal Foch was opposed to any reduction in the number of divisions. He recommended them to make good their weakness by internal reorganisation of units. There were not enough horses for all the gun teams. Lastly, the re-establishment of communications had involved an allocation of 100,000 men for railway service. Nevertheless these troops were about to go into battle again with a very high morale, prepared for hard fighting and heavy losses, in spite of their reduced strength, great physical fatigue and the prospect of carrying on without rest until the winter.

*French Front Extended.*—On the left wing of the French line the I. Army (Debeney), which was to support the British right throughout, remaining in close touch, attacked and captured the strong point of Cérisy, south of St. Quentin, on Sept. 27–29. On Oct. 3 it extended its front of attack and, on Oct. 6, occupied Lesdin and progressed towards Fontaine Uterte while lending effective support to the brilliant offensive of the British. On the right and in the centre Pétain decided to lengthen the front of attack by an operation carried out by the V. Army, in order to exploit the early successes to be obtained by the IV. in the offensive it was to launch in conjunction with the American Army. By this means he hoped to reduce the value of the forts of Reims and the Champagne heights. To exploit the possible success of this V. Army he further ordered the X. to "prepare an action by its right wing in the direction of Chavignon and la

Malmaison." On Sept. 30 the V. Army made a surprise attack between the Vesle and the Aisne, following upon the IV. Army's success of the previous day on the Py. It pushed back the enemy on the east bank of the Aisne-Marne canal from Berry-au-Bac to the Neuville, taking 2,500 prisoners and 30 guns. This victory, added to that of the French IV. Army, forced the enemy to withdraw to the northeast of Reims, behind the Suippe and the line of the Arnes. On Oct. 8 the combined attacks began afresh. While the French IV. Army established itself on the right bank of the Arnes, the V. on its left forced the passage of the Suippe and the X. crossing the Ailette, gained the heights of Cerney en Laonnois and Jumigny.

*Allies' Combined Offensive.*—These advances, in conjunction with the progress of the American I. Army, constrained the enemy to execute a wide retreating movement on to the strong position of Fère—Crécy-sur-Serre—Sissonne—Château-Porcien and the Aisne below Grand Pré ("Hunding" and "Brunhilde" positions). By Oct. 15 the French armies were in contact with this position. From Oct. 15 onward operations on the French front consisted of carrying into execution the commander-in-chief's plan of Oct. 11, of which the dominant idea was that of combining in one and the same manoeuvre the push by the reserve group's left wing (French I. Army) and the Franco-American offensive, which were to sweep away the defences of the Serre and the Aisne. Between these two manoeuvring wings liaison was to be maintained by the interior armies (French X. and V.). The operations began on the wings, from Oct. 15, and the enemy succeeded in holding his ground with the aid of forces taken from his centre. Thereafter set in the battle of the Serre, in the course of which the French X. and I. Armies wore out the enemy to such a degree as to place him at the mercy of a new offensive by the wings, which was to be successively renewed against each of the water lines held by the enemy.

*Hunding Position Captured.*—The French I. Army, charged with the difficult task of simultaneously supporting the attack of the British armies and manoeuvring by the right to turn the enemy resistance on the line Serre-Soissons, carried the Hunding position between the Oise at Mont d'Origny and the Serre below Assis. At the same time the X. Army, attacking on its right, took Verneuil-sur-Serre, Notre-Dame de Liesse and crossed the drainage canal between Vesles and Pierrepont. Under this double menace the enemy, on Oct. 27, evacuated a large stretch of ground between Guise and Crécy-sur-Serre. The French V. Army, attacking west of Chaumont Porcien, had on Oct. 25 wrested from the enemy the last portion of the Hunding position between St. Quentin and the Aisne. The manoeuvre of the left wing, by which Foch intended to break down the line of the Aisne, was thus well under way at the end of October. Operations on the right wing had opened disappointingly for the American I. Army, but a successful attack was launched on Nov. 21; and in the first days of Nov. the enemy, shaken by the assaults of the British and threatened on both wings, began his general retreat from the Dutch frontier to the foot of the Meuse banks. By his capitulation on Nov. 11 he was to escape from the decisive attack that was being prepared in Lorraine for the 14th.

*French Offensive in Lorraine.*—As soon as the first successes of Gen. Fayolle's and Gen. Maistre's groups of armies between Amiens and Reims had been achieved, the commander-in-chief had instructed the eastern group (de Castelnau) to begin to prepare for operations of the same nature. From Oct. 7 to 19 an initial scheme for a large scale offensive had been studied. On the 21st, Foch decided to attack east of the Moselle as soon as possible, "so as to profit by the favourable opportunity afforded by the enemy's weakness in that region and his general lack of reserves." Instructions were sent to de Castelnau to attack between Seille and Sanon by Mangin's X. Army, which was previously to be withdrawn from the reserve group of armies. The attack was to be covered towards Metz by the American II. Army, and towards the Région des Etangs by the French VIII. Army (Gerard). The offensive was to be exploited in the general direction of Morhange-Sarreguemines; and surprise was to be

obtained by the employment of a large number of tanks. These instructions were confirmed by an operation order of Nov. 6, which provided for the participation of the VIII. Army in the exploitation movement on Sarreguemines.

*Allied Plan for Nov. 14.*—On the same day, Gen. Mangin established himself with his general staff at Tantonville, while the concentration of the troops went forward in secrecy. But there was not another moment to lose. The general retreat of the enemy became more evident and Foch pointed out on Nov. 5 "the evident advantage of opening the Lorraine offensive as soon as possible, remembering that the importance of the means matters less than the *moment* of the attack." Without wasting further consideration on the transport crisis or the exact number of American divisions that would be available, therefore, the attack was to be made on a definite date with whatever forces had been assembled by that date. The offensive was to be launched on the morning of Nov. 14 with 28 divisions (six American), three cavalry divisions, powerful artillery and 600 tanks. To this mass attack the enemy would be able to oppose only six divisions (three Landwehr). The unequal distribution of his forces on either side of the Ardennes mass, which was difficult to penetrate, the loss of the Hiron-Mézières railway by means of which he had formerly been able to make play with his reserves, and above all the binding effects of the Allies' general offensive, put him at the mercy of an attack in Lorraine. Nothing but capitulation could save him from complete disaster.

Pursued by the Allies, fleeing in confusion, without supplies, with rebellion in its rear and revolution in Germany, the German Army, now incapable of serious resistance, signed that capitulation on Nov. 11.

VIENNA, Austria (see 28.50), with a population of 1,863,783 in 1923, is now the capital of the Austrian republic, 28.5% of whose population live in the city. Under the constitution of the Austrian Republic the city of Vienna became an autonomous federal province (*Land*); its municipal council receiving the status of a provincial diet. Although no longer the chief city of an empire, Vienna is still the commercial and intellectual centre of southeast Europe. During and immediately after the World War the distress in Vienna was greater than in any other great European city; but following the application of the League of Nations reconstruction scheme to Austria, the position improved. Foreign relief was no longer distributed; and the position, although the improvement was largely due to borrowed money, was not unpromising.

Less trade has been lost to the capitals of new States than was at one time expected: Vienna in particular has been for centuries a commercial centre, and the banks, personnel, offices, etc., are not easily transferred elsewhere. The export of luxury goods is important, and the transit trade with southeast Europe is increasing; the intermediary trade in foreign goods that do not even enter in transit is growing as Vienna remakes its former business connections. The International Fair, which has been restarted, has been successful; it is claimed that it is second only to Leipzig on the European Continent, and is more international in character. Film making is now one of the chief industries. Housing conditions, very bad before the War, were still a great source of difficulty in 1923, but a number of garden suburbs had been erected with the help of the Co-operative Land Settlement movement, by which houses are built co-operatively; and the municipality had also spent large sums on cottages and tenements. The municipality is wealthy, since so large a proportion of the people of Austria live in Vienna, and has spent largely on city improvements, social welfare, public health, education, etc. Several fine public parks have been made from gardens formerly in imperial possession. Parts of the Hofburg, the huge imperial palace, have been turned into offices and shops, and the larger halls are let out on hire. The Schönbrunn palace is now a popular resort. The city belt railway is in process

of electrification, and a new bridge over an arm of the Danube was opened in 1925. The bodies of Beethoven and Schubert have been transferred from the old Währing cemetery (reopened as Schubert Park) to tombs of honour in the central cemetery.

**VIGELAND, ADOLF GUSTAV** (1869— ), Norwegian sculptor, was born at Mandel in South Norway on April 11 1869. In early youth he received instruction in wood engraving and in 1889 at Christiania (Oslo), produced his first work as a sculptor, a relief depicting incidents from the *Iliad*. He afterwards travelled widely and studied technique under Skeibrok in Christiania and Bissen in Copenhagen. Vigeland's subsequent work deals almost entirely with the primitive emotion of men and women. As his genius developed he forsook his earlier semi-impressionistic form of art and adopted a more classic style. His chief work "The Fountain," which was commenced in 1915, is still unfinished (1926). It was intended, when complete, to consist of 26 large groups of stone and a multitude of minor figures in bronze; the whole depicting the history of mankind, through its vicissitudes from barbarism to civilisation. Vigeland also achieved a wide reputation as a portrait sculptor and was commissioned to execute busts of many prominent men. See M. G. Vidalene, *L'art norvégien contemporain* (Paris, 1921).

**VILDE, EDUARD** (1865— ), Estonian author, was born March 6 1865. He attended the German Revel district school and from his youth he devoted himself to publicist activities as a journalist and author. In 1905 he travelled extensively in Europe, and after the Russian revolution of that year, he emigrated to Copenhagen. In 1910 he visited America, on which he wrote some satires (*Muiged*, 1914). In 1917 he returned home and, three years later, was appointed first Ambassador of the Estonian Republic to Berlin. Vilde composed some 10 long prose works, including a series of voluminous and valuable novels, also two plays, *Pisuhänd* (Dragon) and *Tarmata ime* (The Unattained Miracle). His fiction is of a high order, and deals chiefly with Estonian social problems. His best novels are: *Mantra sõda*, dealing with economic unrest among the Estonian peasantry in the middle of the 19th century; *Prohvet Maltswet* (Prophet Maltswet); *Külmale maale* (The Cold Country of Siberia) and *Mäekula piimamees* (The Milkman of Mäekula).

**VILLARD, OSWALD GARRISON** (1872— ), American editor and publisher, was born at Wiesbaden, Germany, of American parentage, March 13 1872. After graduation from Harvard University (A.B., 1893) he was appointed assistant in U.S. history there, but resigned in 1896 to take up newspaper work. He was a reporter on the *Philadelphia Press*, 1896-7, in which year he joined the editorial staff of the *New York Evening Post*, becoming ultimately president of the company. He also became interested in the *New York Nation*. In July 1918 he sold the *Post*, retaining his connection with the *Nation*, of which he was editor. He also owned *The Nautical Gazette*, New York City.

He wrote *John Brown—A Biography Fifty Years After* (1910); *Germany Embattled* (1915); and *Newspapers and Newspaper Men* (1923).

**VILLARI, PASQUALE** (1827-1917), Italian historian and statesman (see 28.76), was invested in 1910 with the the order of the Annunziata. He died in Florence Dec. 5 1917.

**VILNA** or Wilno (see 28.88), a city, lying within a former province of the Russian Empire of the same name, on the main railway between Berlin and St. Petersburg (Leningrad). In nationality the population (214,600 in 1914), is very mixed, and almost all recent statistics are so tendentious as to be valueless. Greater reliance can be placed upon the percentages given in the Russian Imperial census of 1897.

From the political and cultural point of view, the affinities of Vilna were equally complicated. In the Middle Ages Vilna had been the capital of the little state of Lithuania. After the union of Lithuania with Poland, which brought all parts of the former Lithuanian kingdom under Polish influence, the city became a centre of Polish culture. It was at the same time one of the chief cultural centres of the East European Jews. The suc-

| Census of 1897                               | Russians | White Russians | Poles | Lithuanians | Jews  | Others |
|----------------------------------------------|----------|----------------|-------|-------------|-------|--------|
| For the Province of Vilna including the City | 5.00     | 56.05          | 8.18  | 17.59       | 12.72 | 0.46   |
| For the City of Vilna                        | 20.50    | 4.20           | 30.90 | 2.00        | 40.30 | 2.10   |

cessive partitions of Poland brought Vilna under Russian rule, together with the whole of Lithuania and a great part of Poland. The question of the political disposal of Vilna therefore did not arise until Poland and Lithuania re-emerged, this time as separate and mutually unfriendly States, after the World War of 1914-8. No definite frontier between the two states was laid down by the Treaty of Versailles. On Dec. 8 1919 the Supreme Council of the Allies in Paris laid down a provisional eastern frontier for Poland, the so-called "Curzon line," which assigned to Poland most territories where the Polish element was in a majority, but excluded mixed and doubtful districts, the principal among these being Vilna city and province.

Meanwhile, during and after the War, Vilna was occupied successively by the Germans, Lithuanians, Bolsheviks, Poles (who held it at the moment when the Curzon line was laid down), the Bolsheviks, who retook it during their invasion of Poland in 1920, and finally by the Lithuanians, to whom the Soviet Govt. ceded Vilna under a peace treaty signed at Moscow on July 12 1920. The subsequent retreat of the Russians brought Polish and Lithuanian troops into collision on the edge of the Vilna area; Poland appealed to the League of Nations; and the League persuaded the Lithuanians to withdraw to the east of the Curzon line, while obtaining a pledge from Poland to respect the neutrality of the Vilna territory east of the line, which was now occupied by the Lithuanians. On these terms a Polish-Lithuanian Armistice convention was signed on Oct. 7 1920 at Suwalki but on Oct. 9 the Lithuanians were driven out of the city of Vilna and the greater part of the province by an independent Polish commander, General Zeligovski. His action was nominally disowned by the Polish Govt., but Vilna has remained since then continuously in Polish hands.

The League of Nations made a number of fruitless attempts to secure a just and satisfactory settlement not based on force and incidentally to reassert its own authority, which had been flouted by General Zeligovski's action. The first abortive scheme was the taking of a plebiscite under the protection of a mixed international force, but in March 1921 this was abandoned in favour of direct negotiations between Poland and Lithuania under the presidency of M. Hymans, representing the League. M. Hymans proposed the incorporation of Vilna in Lithuania as an autonomous canton with special guarantees, on condition that Lithuania contracted with Poland a permanent military and economic alliance. These proposals pleased neither party, and in Jan. 1922 the Council of the League virtually abandoned the case in despair and withdrew its commissioners from the spot. Meanwhile, in the Peace Treaty of Riga, Soviet Russia had accepted a new Russo-Polish frontier running to the east of Vilna up to the river Dvina; and this line was endorsed by the Conference of Ambassadors in a decision published on March 15 1923. In the same decision the Ambassadors laid down a frontier between Poland and Lithuania which assigned to Poland Vilna and the whole district which had been forcibly seized by General Zeligovski. Lithuania refused to recognise this decision but failed to obtain any satisfaction either from the principal Allied Powers or from the Council of the League of Nations. On Dec. 14 1925 the Polish diet passed a bill unifying the Wilno province with the rest of Poland. (See also LITHUANIA; POLAND; LEAGUE OF NATIONS.)

**VINCENT, GEORGE EDGAR** (1864– ), American educationalist, was born at Rockford, Ill., March 21 1864. After graduating from Yale in 1885, he engaged in literary work and in 1886 was made literary editor of the Chautauqua Press. He was president of the Chautauqua Institution from 1907 to 1915 and thereafter honorary president. In 1892 he was appointed fellow at the University of Chicago, receiving his Ph.D. in 1896. He taught at Chicago as instructor, assistant professor, associate professor, and from 1904 to 1911 as professor of sociology. He was dean of the junior colleges from 1900 to 1907 and then for four years was dean of the faculties of arts, literature and sciences. From 1911 to 1917 he was president of the University of Minnesota. In 1917 he was chosen president of the Rockefeller Foundation in New York City; he had been a member of the General Education Board since 1914. Vincent was author with Albion W. Small of *An Introduction to the Study of Society* (1895) and *The Social Mind and Education* (1897).

**VINOGRADOFF, SIR PAUL GAVRILOVICH** (1854–1925), Anglo-Russian scholar, was born at Kostromo, near Moscow, and educated at the University of Moscow. As a young man he travelled widely, and obtained a working knowledge of at least seven modern languages, before being appointed a professor in his own university. He then interested himself in the Zemstvo movement, and was specially keen on improving the provision for the education of the Russian people. His activities, however, were displeasing to the authorities, consequently he resigned his professorship and in 1902 settled in England, where he had already made friends with many English scholars. In 1903 he was appointed Corpus professor of jurisprudence at Oxford, and there he remained until his death on Dec. 19 1925. In 1917 he was knighted, and his honours included a fellowship of the British Academy. In 1917, on the outbreak of the revolution, he again took part in Russian politics, but as the reformers became more extreme in their tendencies his sympathies vanished, and were finally changed into hostility tempered with grief.

Vinogradoff's first book was on *The Origin of Feudalism in Italy* (1887). This was written in Russian, but his later works were appropriately written in English, and he became recognised as probably the first authority on the early laws and customs of that country. His standard work is *Villeinage in England* (1892), in which he put forward the theory that the Anglo-Norman manor descended not from a condition of serfdom, but from a free village community. His article "Folkland," published in *The English Historical Review* in 1893, put forward an entirely new theory on this subject. His other works are *English Society in the Eleventh Century* (1908); *The Growth of the Manor* (1905); *Roman Law in Mediaeval Europe* (1909). He also wrote *Self-government in Russia* (1915) and *Outlines of Historical Jurisprudence* (1920–2). He wrote for *The Encyclopedia Britannica* and *The Cambridge Modern History*. At Oxford, Vinogradoff conducted a seminar which offered a suitable outlet for his immense store of knowledge. (See RUSSIA.)

**VINTON, FREDERIC PORTER** (1846–1911), American portrait painter (see 28.101), died in Boston, Mass., May 19 1911.

**VIRGINIA** (see 28.117).—The population in 1910 was 2,061,612; in 1920, 2,309,187, a decennial increase of 247,575 (12%) and an average annual addition of 24,757; in 1923, 2,398,441, an increase in three years of 89,254, and an average annual addition of 29,751. In 1920 negroes numbered 690,017 as compared with 671,096 in 1910. Urban population in places of more than 2,500 inhabitants was 23.1% of the whole in 1910 and 29.2% in 1920.

The population of the principal cities and its increase were:—

|                | 1920    | 1910    | Increase per cent |
|----------------|---------|---------|-------------------|
| Richmond . . . | 171,667 | 127,628 | 34.5              |
| Norfolk . . .  | 115,777 | 67,452  | 71.6              |
| Portsmouth . . | 54,387  | 33,190  | 63.9              |
| Roanoke . . .  | 50,842  | 34,874  | 45.8              |

*Agriculture and Industry.*—In 1900 the value of farm property—land, buildings, implements, machinery, livestock—was

\$323,515,977; in 1920 it was \$1,196,555,772, an increase in 20 years of 269%. In 1908 the value of agricultural products was \$100,531,000, in 1920 \$187,038,000 and in 1924 \$165,775,000.

The production of the staple crops was:—

|                     | 1920        | 1924        | 1925        |
|---------------------|-------------|-------------|-------------|
| Maize (bu.) . . .   |             |             | 36,058,000  |
| Corn (bu.) . . .    | 50,100,000  | 35,679,000  |             |
| Wheat (bu.) . . .   | 11,425,000  | 9,628,000   | 8,946,000   |
| Oats (bu.) . . .    | 4,818,000   | 4,019,000   | 5,826,000   |
| Rye (bu.) . . .     | 864,000     | 537,000     |             |
| Barley (bu.) . . .  | 405,000     | 324,000     |             |
| Buckwheat (bu.) .   | 540,000     | 348,000     |             |
| Tobacco (lb.) . . . | 177,390,000 | 141,240,000 | 129,542,000 |
| Hay (tons) . . .    | 1,235,000   | 1,545,000   |             |
| Peanuts (bu.) . . . | 4,416,000   | 3,700,000   |             |
| Potatoes (bu.) . .  | 13,608,000  | 19,200,000  | 11,340,000  |
| Cotton (bales) . .  | 19,000      | 30,000      | 52,000      |
| Apples (bu.) . . .  |             |             | 8,844,000   |

The mining and quarrying industry in the decade 1909–19 showed an increase of 34.7% in the number of enterprises, 1.9% in capital and 233.8 in the value of the product, and a loss of 11.5% in mines and quarries, 2.7 in persons engaged and 4.7% in wage-earners.

|                        | 1919         | 1922         |
|------------------------|--------------|--------------|
| Enterprises . . .      | 202          | 139          |
| Mines and Quarries . . | 216          | 140          |
| Persons engaged . . .  | 15,537       |              |
| Wage-earners . . .     | 14,547       | 13,675       |
| Capital . . .          | \$57,035,775 | \$59,730,376 |
| Value of product . . . | 29,363,449   | 26,953,329   |

Virginia in 1920 led in the production of iron, pyrites and soapstone, was third in the production of lime and manganese and sixth in mineral waters. The latest available report lists the pyrites plants as idle. The following figures are from the report of Virginia Bureau of Labour and Industrial statistics:—

|                               | Establishments | Capital      | Value of Product |
|-------------------------------|----------------|--------------|------------------|
| Coal . . .                    | 92             | \$54,106,000 | \$23,106,994     |
| Iron ore . . .                | 6              | 621,338      | 901,203          |
| Mineral waters . . .          | 4              | 43,800       | 29,098           |
| Pyrites . . .                 | Plants idle    |              |                  |
| Soapstone . . .               | 3              | 342,905      | 796,287          |
| Millstones, sand and gravel . | 15             | 460,600      | 429,938          |
| Slate . . .                   | 4              | 275,000      | 327,604          |
| Miscellaneous ores . . .      | 7              | 3,103,596    | 858,554          |
| Lime . . .                    | 39             | 5,799,337    | 5,406,907        |

Statistics of manufactures show great variations in the decade 1909–20 and after, due to the war prices. In 1909 the value of products manufactured by 5,685 establishments was \$219,794,000; in 1919 by 5,603 establishments it was \$641,810,000, and in 1923 by 2,010 establishments was \$547,927,531. The following figures for 1920 are from the 14th census and for 1923 from the report of the Virginia Bureau of Labour and Industrial Statistics:—

|                                | 1920                 | 1923                     |
|--------------------------------|----------------------|--------------------------|
| Establishments reporting . . . | 2,159                | 2,010                    |
| Capital invested . . .         | \$362,328,506        | \$446,678,544            |
| Materials . . .                |                      | 268,940,460 <sup>1</sup> |
| Value of products . . .        | 638,936,186          | \$47,927,531             |
| Value added by manufacture . . |                      | 185,321,001 <sup>1</sup> |
| Wage earners (average) . . .   | 129,251 <sup>1</sup> | 121,416                  |

<sup>1</sup> Figures are for 1921; no record in 1920.

*Property Values.*—The valuation of property assessed for taxation in 1910 was \$756,194,480; in 1920, \$1,459,762,653. In 1900 the estimated true value of all property was \$1,102,310,000; in 1922 \$4,891,570,000, distributed as follows: Real property and improvements \$2,772,373,000; live stock, \$92,653,000; farm implements and machinery, \$35,576,000; manufacturing machinery, tools and implements, \$164,146,000; railroads and their equipment, \$501,972,000; motor vehicles, \$63,113,000; street railways, shipping, etc., \$178,308,000; all others, \$1,083,429,000. The estimated true value of wealth added in 1912–22

was \$2,601,656,214. In 1909 the public debt was \$24,956,959, in 1919 it was \$23,561,823, and in 1923 it was \$21,173,703. In 1910 the state's income was \$11,333,490, in 1920, \$18,442,324, in 1923, \$27,992,317, and the disbursements (1923) were \$26,562,012. Between 1910-20 notable reforms were made in taxation and financial administration. The tax laws were in 1915 revised as follows: the state levy on real estate and tangible property was restricted to educational purposes, and state and local levies on intangible property were apportioned at 65 cents and 30 cents per \$100 respectively.

**Constitution.**—In 1910 the state constitution was amended to permit the re-election of county treasurers and commissioners of revenue, and in 1912 another amendment permitted the re-election of city treasurers and commissioners of revenue. In 1912 the Legislature was empowered to classify cities according to population and to provide forms of city and town government, but cities with over 50,000 population were permitted to have special forms of government. Under this amendment the Legislature provided for general charters under the commission, or manager, form, but in 1920 another amendment was ratified which permitted the Legislature to provide special forms of government for any city on condition that the sections of the constitution regarding franchises, changes in city boundaries, public debts and the assessment of property were not violated. In 1920 another amendment removed the requirement of residence within the municipality as qualification for appointment to office in a city Government when technical training was requisite. In 1920, also, the construction of roads was made a proper subject for state debt.

**Education.**—The cost of public education is borne by the State. In 1922-3 there were 6,563 buildings for elementary schools with 13,606 teachers and an enrolment of 562,998 pupils. For secondary education there were 408 high schools, 49,450 pupils and 2,725 teachers. Separate schools are provided for white and coloured pupils. There is a school at Staunton for deaf and blind white children and one at Newport News for deaf and blind coloured children. Institutions for higher education receiving state support are the University of Virginia, the Virginia Polytechnic Institute, Virginia Military Institute, the College of William and Mary and five Normal Schools, one each at Fredericksburg, Farmville, East Radford, Harrisonburg and Petersburg, the last for coloured students. Other institutions of higher education are: For men—Washington and Lee University, University of Richmond, Roanoke College, Emory and Henry College, Hampden-Sidney College, Randolph-Macon College and Virginia Christian College; for women—Hollins College, Martha Washington College, Randolph-Macon Woman's College, Sweet Briar College and West Hampton College. The school revenue was \$4,407,853 in 1910 and \$13,791,864 in 1920. In the school year ending in 1923 the aggregate of state, city and county revenue expended for elementary and secondary education was \$22,109,791. In 1918 a general property tax was added to the existing sources of school revenue which yielded approximately \$660,000. In 1918 school attendance of all children between the ages of 8 and 12 for 16 weeks was required.

In 1920 the legislature submitted for ratification the following amendments to the constitution: legalising the membership of women on school boards, removing the limitation on county and district school tax rates and all limitation on the legislature in enacting compulsory attendance laws, and giving the legislature the power to fix the duties of the state Board of Education. Among statutes enacted in 1920 looking to the improvement of the school system were laws encouraging a nine months' term in rural communities, making the school age 7 to 20 years, provision for a school census, encouragement of rural high schools, conferring on the state superintendent the right to nominate candidates for positions as teachers, provision for physical education and medical inspection and placing the state institutions of higher education on an all-year basis of operation. The railroad mileage in 1922 was 4,668; the electric-railway mileage, 447.27 and the telephone-wire mileage, 379,973. The number of telephones was 155,490.

**Legislation.**—In 1912 the work of children under 12 years of age in coal mines was prohibited and the 10-hour day for children in factories was extended to workshops and mercantile establishments, with the exception of packing and fruit industries between July 1 and Nov. 1, mercantile establishments in towns of less than 2,000 population and Saturday work in mercantile establishments. In 1918 the minimum age for employment was raised to 16 years. In 1922 the legislature changed the name of the state Board of Charities and Correction to the State Board of Public Welfare, and conferred on it much larger powers, namely supervision of state institutions, licensing of all child-caring institutions, organising of juvenile and domestic relations courts, local boards of public welfare, administration of child welfare legislation, direct handling of all delinquent children and of many dependent and neglected children. The charitable organisations under this board handled 135,000 cases at a cost of \$4,279,873, and the correctional institutions 165,399 cases at a cost of \$5,526,781. In 1918 a Mothers' Pension Law was enacted which allowed city and county Governments to make payments to widows with children under 16 years of age. In the same year the principle of the uniform Family Desertion Acts was adopted, and an industrial commission was provided to administer a workmen's compensation system.

Three sanatoria for the treatment of tuberculosis have been established. In 1918 a state orthopaedic hospital was established at Richmond. In 1914 the Virginia Home and Industrial School for Girls, a private institution, became the property of the State, and subsequently three other reformatories were taken over. In 1919 the state Prison Board was reorganised, and reforms in prison management were adopted. In 1914 a state forestry commission was established.

**Political History.**—In every state and national election after 1910 the Democratic party had a majority. In 1909 William Hodges Mann (Dem.) was elected governor, his term being from 1910-4; he was succeeded by Henry Carter Stuart (Dem.), 1914-8; Westmoreland Davis (Dem.), 1918-22; and E. Lee Trinkle (Dem.), 1922-6. (J. S. P.)

**VIRGIN ISLANDS** (see 28.126).—This group, located in the Lesser Antilles, just east of Porto Rico, includes the former Danish West Indies (St. Thomas, St. Croix and St. John), purchased by the United States from Denmark in 1917 for \$25,000,000, and the islands of Vieques and Culebra, acquired by cession from Spain in 1898. The popular language of the Danish islands was at first a Dutch *patois*, later English, though Danish was always the official language during the 242-year period of Danish rule.

**Area and Population.**—The combined area of the three principal islands is 132.47 sq. m., and their population in 1917 was 26,051. St. Croix had 14,901 inhabitants; St. Thomas, 10,191; and St. John, 959. Only 7.4% were white; the rest negro and mixed blood. Charlotte Amalie, now St. Thomas, on the south side of the island of St. Thomas, is the largest town (population 7,747 in 1917) in the islands, is the seat of government, and has one of the finest harbours in the West Indies. St. Croix has two towns, Christiansted and Fredericksted. St. Thomas is 1,400 m. from New York and 1,020 m. from the Panama Canal. The chief products of St. Croix are sugar and molasses. From the *pimenta acris* on St. John and St. Thomas is produced the finest bay oil and bay rum in the world. The islands have been administered by the U.S. Navy Department since 1917.

**BIBLIOGRAPHY.**—W. Westergaard, *The Danish West Indies Under Company Rule, 1671-1754* (1917) is the only history based on original sources. For general descriptions see Brock, Smith and Tucker, *The Danish West Indies, Their Resources and Commercial Importance* (1917); L. Zabriskie, *The Virgin Islands of the U.S.A.* (1918); T. De Booy and J. T. Faris, *The Virgin Islands, Our New Possessions, and the British Islands* (1918). (W. We.)

**VISCONTI-VENOSTA, EMILIO**, MARQUIS (1829-1914), Italian statesman and diplomat (see 28.129). After representing Italy at the Algeiras Conference the Marquis Visconti-Venosta retired into private life, but on account of his great experience,

profound legal and political culture and sound judgment, he was often consulted by his Government, especially on questions of foreign affairs. He explicitly approved of Italy's declaration of neutrality on the outbreak of the World War. He died in Rome Nov. 28 1914.

**VISSERING, GERARD** (1865— ), Dutch banker and economist, was from 1906–11 president of the Java Bank in Batavia. In 1911 he was appointed adviser on currency and banking affairs to the Chinese Govt., and in the following year became president of the Netherlands Bank. Dr. Vissering was one of the vice-presidents of the Brussels Financial Conference held in 1920 and after the World War his advice was repeatedly sought on matters concerning the stabilisation of the financial position of various countries.

Among his numerous works are *De Javasche Bank; On Chinese Currency* (1912); *The Netherlands Bank and the War* (1917); *De goudquestie* (The Problem of Gold, 1918); *Muntwezen en Circulatie-Banken in Ned. Indië* (currency and circulation banks in the Netherlands East Indies, 1920) *International Economic and Financial Problems* (1920).

**VISTULA** (German Weichsel, Polish Wisla: see 28.146).—Rising in Czechoslovakia, the Vistula runs through Poland, along the frontier of E. Prussia, and debouches through the territory of the Free City of Danzig. Its situation fits it to be a waterway of the first importance, although it is liable to floods and frozen over for three months in the year. It must be made navigable for river-craft at their full capacity during a sufficiently long period of the year; and must be open to international shipping on a footing of equality. At present it is navigable up to Przemsza, but there is not regular traffic above Warsaw, although it is largely used for timber-floating.

Before the War conservancy works had only been carried out on the German part of the river, some 222 km. in length; spur and longitudinal dykes were built to maintain the water level, thereby facilitating the flow of water at flood-time and also improving navigability. Since the War Poland had been too occupied to carry out improvement works, or even much in the way of upkeep. Traffic has greatly decreased, mainly owing to the general economic crisis.

The Vistula requires conservancy works throughout its whole course. The mean water-level should be maintained by the construction of spur and longitudinal dykes to narrow the normal river-bed; the river should be regulated at low-water level in the interests of its navigability, which might also be improved by the construction of reservoirs on the upper courses of some of the tributaries.

Under Article 18 of the Treaty concluded at Versailles on June 28 1919, between Poland and the Allied and Associated Powers (the so-called "Minorities Treaty") Poland undertook to apply to the river system of the Vistula (including the Bug and the Narew), pending the conclusion of a general convention on the international régime of waterways, the régime set out in Articles 332–337 of the Treaty of Versailles, that is to say, the régime applicable to International Waterways.

Serious differences of opinion arose as to the interpretation of the legal status of the Vistula. It has been asserted that Article 18 should be held to provide for the possibility of the Vistula being subject to the régime of the Barcelona Convention (see INLAND WATER TRANSPORT), once that Convention has been ratified by Poland, and should the Vistula come under the general definition contained in the said Convention. But those who urge this theory do not consider that the Vistula comes under this definition, since the criterion therein accepted is that the part of the river which is naturally navigable should traverse or separate several States.<sup>1</sup> As the right bank of the Vistula in Eastern Prussia has been given to Poland to a depth of 50 metres in land, Germany is not a riparian State; and the Free City of Danzig should not in law be considered as a State.

On the other hand it has been urged that the words "pending the conclusion" mean that the régime of Articles 332 to 337 will be automatically superseded by the régime of the General

Convention as soon as the latter has been concluded, and this regardless of the fact whether the Vistula will, or will not, eventually come under whatever general definition is established by the General Convention given in the said Convention. Those who put forward this second argument assert that the Minorities Treaty certainly did not contemplate a temporary international régime for the Vistula, since such an arrangement would have been contrary to all ideas of an international régime. They maintain that, if it is to the interest of international shipping to have certain guarantees of freedom of navigation and equality of treatment, that interest does not cease with the conclusion of an international convention. Further, they are of opinion that the Vistula is included in the category of navigable waterways referred to in paragraph 2 of Article 1 of the Barcelona Statute. A solution to this acute legal controversy will hardly be found unless the dispute becomes an inter-State one and comes before the Permanent Court of International Justice. Navigation cannot be fully developed without equality of treatment for all flags. The acceptance of this principle by the States concerned, particularly Poland, would be in their own true economic interest.

See *Vistula: Traité des Minorités entre les principales Puissances alliées et associées et la Pologne du 28 juin, 1919* (Great Britain, Treaty Series, 1919, No. 8). (R. RN.)

**VISTULA-SAN, BATTLES OF THE.**—The middle of Sept. 1914 marked a distinct stage in the World War, both in the Western and Eastern theatres. The first clashes of the main armies on either side had ended. The general staffs of the contending Powers had to take stock of the results and to make new plans accordingly (see EASTERN EUROPEAN FRONT and map).

*German Position.*—To Falkenhayn, who had succeeded Moltke as the arbiter of German strategy, the problem of the Eastern Front must have presented itself somewhat as follows: The battle of the Marne had shaken, if not shattered, the whole foundation of the ambitious German plan, built up through long years of preparation, tested till failure seemed impossible. The immediate overthrow of France could not now be achieved; but the West remained still the decisive theatre and no further reinforcements could yet be spared for the East. Something, however, must be done to rally the beaten Austrians and to save the important industrial area of Silesia from invasion. The victories over Samsonov and Rennenkampf in East Prussia (see MASURIA, BATTLES IN) had rendered that province secure from invasion for some time, but these battlefields were too far distant from Galicia for success to bring relief to the Austrians. Direct assistance was required. Accordingly 5½ corps, the bulk of the forces in East Prussia, were transferred by rail to the Cracow-Częstochowa area in the latter half of September.

This move required some 750 trains and was completed between the night of Sept. 16–17, when the troops began to entrain about Königsberg and Lötzen, and Sept. 28, when they were deployed on the frontier of south Poland ready to advance. They were formed into the IX. Army under Hindenburg, with Ludendorff as his chief of staff. The VIII. Army was left in East Prussia with much reduced forces. The plan was for Hindenburg's army to advance against the stretch of the Vistula between Zwikhost and Deblin (Iwangród), with the intention of turning the northern flank of the main Russian forces, which were at this time concentrated in Eastern Galicia. A part of the Austrian I. Army (Dankl) was to advance on the north bank of the Vistula to the right of the Germans, while the main-Austrian forces moved to the attack south of the Vistula, the IV. Army (Grand Duke Josef Ferdinand) and III. Army (Boroevich) towards the lower San and Przemyśl, while the II. Army (Bohm-Ermolli) from the Carpathians moved in the direction of Chyrow and Sambor, south of Przemyśl.

*Russian Problems.*—On the Russian side, at the same period of mid-Sept., the most urgent tasks of the commander-in-chief were to reconstitute his northwestern front, shattered by the defeats of the I. and II. Armies in East Prussia, and to build up a central force in Poland about Warsaw. First-line troops from

<sup>1</sup> See Article 1 of the Barcelona Statute.

Siberia and Turkestan, which had not been available for the opening engagements, had now arrived, and a large number of additional reserve divisions were in the field. The IX. Army, which was originally to have formed the nucleus of the central force, had been despatched south in the early days of Sept. to the rescue of the hard pressed IV. Army (see LEMBERG, BATTLES OF), and was now with four other Russian armies (IV., V., III., VIII.) in Eastern Galicia, on the line of the San and Dniester. The supply of these five armies, comprising some 18 or 19 corps, crowded on a comparatively narrow front, was extremely difficult.

As early as Sept. 22 three corps were ordered to move north to relieve the congestion. Shortly afterwards, information was received of the enemy concentration and advance, and a rapid change in the disposition of the armies became necessary to meet this threat. The question arose whether a line could be built up in Poland west of the Vistula with sufficient speed to render it safe to accept battle in advance of the river, or whether the change of front should be carried out behind the shelter of the river barrier. The safer course was chosen; and the principal masses moved to the north in rear of the Vistula, only cavalry forces being left to oppose the hostile advance in trans-Vistula Poland.

The decision was undoubtedly wise, but it involved certain grave disadvantages. It meant the surrender of the whole of southwest Poland to the enemy, severe hardships to the troops in traversing the almost roadless region south of Lublin, and the eventual forcing of passages over the Vistula. Three armies, the IV., IX. and V., moved north, while the III. Army took over the line of the San. The great wheel was completed by the third week in Oct., by which time the V., IV. and IX. Armies, in that order from north to south, lined the Vistula from about Gura Kalwary (south of Warsaw) to Zawichost. Meanwhile a new II. Army had been formed round Warsaw.

*Austro-German Offensive Fails.*—The Austro-German advance, which began at the end of Sept., met only slight opposition till the lines of the Vistula and the San were reached. During the advance, however, the regrouping of the Russian forces became evident and showed that the original German plan was no longer applicable. The main weight of the offensive of Hindenburg's army was therefore shifted northwards against Warsaw, the whole of the Austrian I. Army being moved to the left bank of the Vistula and extended from Sandomierz to below Deblin. By Oct. 12 fighting was general on the whole front. Hindenburg's army was within a few miles of Warsaw, but had greatly superior Russian forces against it; while all along the river from Warsaw to Zawichost the Russian counter-offensive was battling for passages to the left bank.

South of the Vistula, the Austrian IV. and III. Armies had driven in light Russian forces and reached the line of the San by Oct. 10, causing Radko-Dimitriev's III. Army to raise the siege of Przemyśl. But they could make no headway in their efforts to force the line of the San. Nor did the II. Army, advancing from the Carpathians towards Sambor and Chyrow, meet with any greater success.

By Oct. 17 it was obvious to Hindenburg that his offensive could not succeed. North of the Vistula, the German IX. Army and Austrian I. Army were now assailed from Warsaw, from Deblin and from Zawichost by four Russian armies; while south of the Vistula the three Austrian armies could make no progress against the Russian III. and VIII. Armies. The Austro-German attacks were, however, continued till the 21st. They were succeeded by violent Russian counter-attacks, which lasted till the 27th. Hindenburg then broke off the battle and led his IX. Army rapidly back to the frontier, destroying all communications as he retired. Dankl's Austrian I. Army withdrew in more leisurely fashion. Between Oct. 31 and Nov. 2 it held the Russian pursuit at arm's length in the Kielce-Opatów region; and then retired behind the Nida. On the San, fighting continued till the end of Oct., without marked advantage to either side. But early in Nov. the Austrian armies broke off the battle and withdrew, the IV. and III. towards Cracow, the II. to the Carpathians.

Hindenburg's first invasion of Poland had only relieved the pressure on Austria for a time. Its failure left Germany's ally still further exhausted. It was a bold move, typical of Ludendorff's strategy. But he seems to have under-rated the Russian leadership and to have over-rated the fighting powers of the Austrians. The skill with which the Russians changed front and the complete failure of the Austrians to make any impression on the weakened forces behind the San placed the German IX. Army in a perilous position. It was perhaps fortunate for it that the numerous Russian cavalry showed little aptitude for pursuit.

**VITAMINS.**—There are several vitamins recognised. Fat-soluble A vitamin is present in certain fats, particularly in cod-liver oil, fish roe, liver, egg yolk and in green vegetable leaves. This is necessary for growth, fertility and resistance to infective diseases. Water-soluble B vitamin, present in the seeds of plants, egg yolk, yeast and in many fruits and vegetables, also is necessary for health, fertility and resistance to infective disease. Want of this vitamin produces in particular beri-beri, a disease commonly caused by the polishing of rice. The rice berry is thus deprived of this vitamin and becomes a deficient food for natives who live largely on rice. There ought to be a sufficiency of this vitamin in the food eaten in order to ensure proper digestion and utilisation of the food and to keep up appetite. Water-soluble C vitamin is present in most juicy fruits and vegetables; its absence produces scurvy. There is also the antirachitic principle or vitamin D, which prevents rickets and is richly present in cod-liver oil, and can be obtained by irradiating cholesterol or phytosterol with ultra-violet rays.

Cholesterol is a constituent of animal cells and phytosterol of plant cells. An animal, or child, can be prevented from becoming rickety when fed on a deficient ricket-producing diet, by being irradiated or by being given cod-liver oil or irradiated cholesterol. A very small daily dose of the last suffices.

Irradiation with ultra-violet rays appears to endow the atoms of cholesterol with energy. Probably when the skin is irradiated the cholesterol in the skin becomes activated and absorbed. With its help a sufficiency of the salts of calcium and phosphorus required for bone formation are absorbed from the alimentary canal in place of being excreted in the faeces, and thus the deficiency of the diet as far as the bone formation goes is made good. It has not proved possible to separate vitamin D from irradiated cholesterol as a chemical substance, and the activity of irradiated cholesterol is found to be very easily destroyed, e.g., by over-irradiation or by recrystallisation. Vitamins may be concentrated by certain means, but no vitamin has yet been isolated and its nature determined. Their presence is detected by feeding experiments.

In addition to the above four vitamins there is a vitamin E necessary for breeding power, which is most richly contained in the germ of wheat and red meat. Want of this vitamin in animals leads to the death and absorption of the embryos while within the womb of the mother, and so to sterility. A, D and E vitamins are soluble in fats, while B is soluble in water and appears to be a basic substance containing nitrogen. C is water-soluble and very easily destroyed by cooking or canning foods. Fresh, young, green vegetables, eaten as salads or lightly cooked are a most important source of the vitamins. So too are fish, which derive them from the plankton of the sea.

The miller takes away the germ and outer layer of the wheat berry and these valuable parts are given to rabbits, pigs and fowls as bran and middlings. We get white flour robbed of its vitamins and of some of the protein and most of the very important salts of phosphorus which whole wheatmeal contains. Rice, cornflour, sago, tapioca, pearl barley, pea flour, oatmeal, split peas and lentils are similarly impoverished by the miller. What are needed are wholemeal, with the germ ground very fine so as to be digestible, whole peas, beans and lentils, salads, fruits and vegetables, milk and butter of cows fed on green grass and so rich in vitamin A. Stall-fed cows' milk is deficient. (L. E. H.)

**VITTORIO VENETO, BATTLE OF.**—Diaz's plan for the bigger offensive finally decided for Oct. 1918 (see ITALIAN CAMPAIGNS) was to concentrate on the Piave front between Pederobba and Fagaré (east of Treviso), to cross the river and break through by way of Conegliano to Vittorio Veneto, dividing the Austrian V. and VI. Armies which held the river line from the sea to Valdobbiadene. The attack was fixed for Oct. 16, but bad weather and a rise of the Piave caused a delay which was used to extend the plan of operations.

*Italian Plans.*—It was decided to open the action with an attack by the IV. Army (nine divisions) in the Grappa sector, with the double object of drawing the enemy reserves from the Feltre sector and of breaking through in this direction. The attack on the Piave was to be carried out by three armies, the XII., VIII. and X., of which the first and last had been formed

Already a very fine piece of work had been carried out by British troops of the X. Army, who in the early hours of the same day occupied the northern part of the long shoal island of the Grave di Popodopoli, crossing the main channel in small flat-bottomed boats punted by Italian specialist troops (*pontieri*), and driving back or capturing the enemy outposts. The general attack should have followed the next night, but a sudden rise in the river, which was coming down in heavy flood at seven miles an hour, counselled delay. It was not until the night of Oct. 26, when the southern part of the Grave di Popodopoli had also been occupied by Italian troops of the X. Army, that the bridges began to be thrown across the river for the main attack.

*The Crossing of the Piave.*—Eleven crossing points were selected, one at Pederobba for the right wing of the XII. Army, seven on the VIII. Army front, and three for the X. Army, at the Grave di Popodopoli. The XII. and X. Armies threw their bridges successfully, but on the VIII. Army front only two of the seven sets of bridges could be established, both on the north of the Montello. Next day three bridgeheads were established: opposite Pederobba, north of the Montello, and opposite the Grave di Popodopoli. The most important advance was made in the latter sector, where the X. Army succeeded in advancing to a depth of over two miles, on a front of about four miles. The British XIV. Corps took 3,500 prisoners, and 2,100 were captured by the Italian VI. Corps.

This was the most successful advance of the day. The bridges of the VIII. and XII. Armies were all destroyed during the day. At Pederobba some headway was made, and the troops of the VIII. Army, who attacked towards Sernaglia, gained about a mile. But the right wing of the Army (VIII. Corps) was unable to throw its bridges, and only a detachment of storm-troops reached the left bank. There was a gap of some six miles between the left wing of the VIII. Army and the British XIV. Corps, which formed the left wing of the X. Army, and the chief move in the general manoeuvre was checked. The VIII. Corps had been detailed to push straight for Vittorio Veneto, and the fact that it had been unable even to start its advance threatened to throw the whole battle out of gear.

No better fortune attended the efforts made on the following night to bridge the river east of the Montello. The swift current and the enemy guns defied all attempts to establish the bridges, and the engineers suffered very heavy casualties. In spite of the initial successes, the situation was unsatisfactory, but after the first failure to cross the river east of the Montello, Gen. Cavaglia, who commanded the VIII. Army and had the general direction of the attack, had detached the XVIII. Corps from his reserves, to pass under the command of Lord Cavan, cross by the X. Army bridges, push north and clear the front of the troops who were held up. The move was entirely successful. The XVIII. Corps under Gen. Basso crossed the river in the early hours of Oct. 28 and attacked northward, while the rest of the X. Army continued its advance.

*Position on Oct. 29.*—At the close of Oct. 28 the XVIII. Corps had gained nearly four miles and had crossed the railway north of the Priula bridges. The British XIV. Corps had gone right through the Austrian positions and had patrols out on the Monticane, while the Italian XI. Corps was threatening the enemy troops on the Lower Piave. The bridgehead was 10 miles wide and four miles deep. The XII. Army and the left wing of the VIII. had also made good progress, and at last the VIII. Corps was crossing the river, between Nervesa and Ponte di Priula. The prospects of the following day were bright, for the separation of the Austrian V. and VI. Armies was effected; and the VI. Army, heavily attacked in front, was threatened on its left by Basso's XVIII. Corps.

On the evening of Oct. 29 an Italian flying column entered the town of Vittorio Veneto. The attacking armies had already taken 33,000 prisoners, and the situation of the Austrian troops on the Piave was hopeless. Next day resistance broke down, and the general retirement ordered on the 29th became a complete rout. The troops on Monte Grappa had hitherto held firm against the repeated attacks of the IV. Army, and had made

specially for this offensive. The XII. Army (one French division and three Italian) was commanded by Gen. Graziani, the commander of the French troops in Italy; and the X. Army (two British divisions and two Italian) by Lord Cavan.

The main drive was to be made by the VIII. Army (14 divisions), attacking from below Pederobba to Ponte della Priula. The XII. Army was to advance northward outside the Piave, while the X. Army was to attack the right wing of the Austrian V. Army and form "a defensive flank to cover and protect the principal manoeuvre of the VIII. Army" (Gen. Diaz's report). On the battle front from the Brenta to Fagaré were massed 41 divisions, 22 in line and 19 in reserve. Against this force the Austrians had 23 divisions in line and immediate reserve, and 10 more divisions within reach. The Piave-Grappa front was divided between two army groups: Boroevič's Piave Group (V. and VI. Armies), from the sea to Valdobbiadene, and the newly formed Belluno Group, under Gen. Goglia, from Valdobbiadene to the Brenta.

*Austrian Forces.*—The disposition of the Austrian troops and guns showed a fear for the Grappa positions and a failure to divine the direction of the main Italian attack. In the Grappa sector the Belluno Group had eight divisions in line and three in immediate reserve, while the infantry was backed by some 1,200 guns. The Austrian VI. Army, on the other hand, with seven divisions in line and two in support, had only about 500 guns against a mass of over 2,000. Opposite Lord Cavan's X. Army the right wing of the Austrian V. Army had three divisions in line and one in support.

*Allied Attack Opens.*—The Italian IV. Army, under Gen. Giardino, attacked at dawn on Oct. 24, and though some headway was made the enemy put up a very stubborn resistance.

many counter-attacks. But here too, on the night of Oct. 30, a retreat began that was to turn into a flight.

**Austrian Collapse and Armistice.**—Late on the evening of Oct. 30 the Austrian command announced that in view of the discussions regarding an armistice which were being conducted between Germany and the United States, "our troops fighting on Italian soil will evacuate the occupied region." On the same day the order for a general retreat was given, and that evening, in the Val Lagarina, Gen. Weber von Webernau, commander of the Austrian VI. Corps, made a formal demand for an armistice. Next day he and his staff were taken to the Villa Giusti, near Padua, and discussions were begun. It was, of course, necessary to communicate with Versailles, where the Allied War Council was discussing the question of a reply to Germany's demand for an armistice.

Meanwhile the fighting continued, and the armies of the Monarchy crumbled away. The Italian VI. and I. Armies attacked in the Trentino, and the III. Army, which had crossed the Piave two days before, was already taking part in the pursuit of Borojevič's broken divisions. On the night of Nov. 2-3, although the Armistice was not yet signed, the Austrian command issued an order for the cessation of hostilities. It was at first revoked by the Emperor Charles, but was reissued and reached the front on the morning of Nov. 3. In point of fact, the terms of the Armistice were only agreed on verbally on the afternoon of Nov. 3, and signed at 6:30 P.M. Hostilities were to end at 3 P.M. on Nov. 4.

The Austrian surrender was complete. The troops of the Monarchy were to retire beyond the Treaty of London line, leaving all war material and railway equipment. The army was to be demobilised except for 20 divisions at pre-War peace strength, and the Allies were to have the right to occupy any strategic points in Austria-Hungary which they might deem necessary, and were to have free right of passage and use of Austro-Hungarian means of transport "over all road and rail and water-ways in Austro-Hungarian territory."

**Conclusion.**—When hostilities ceased, Italian troops were far up the Trentino and into Cadore, and to the east the line of the old frontier was passed and the middle waters of the Isonzo were reached. On Nov. 3 Trieste had been occupied from the sea, and half an hour before the expiration of the term fixed by the Armistice an Italian force was landed at Zara. More than 300,000 prisoners had already been counted by the Italians, and the total figure was in the region of 500,000. A number of troops who had been cut off were allowed to pass the frontier after being disarmed, but not much more than half of the Austro-Hungarian troops on the Italian front reached the territory of the crumbling empire. All material was left behind, including some 7,000 guns.

The Austro-Hungarian armies, in spite of bad food and growing depression, began by putting up a stout resistance. The troops in the Grappa sector in particular not only resisted firmly but counter-attacked with great vigour, and punished the Italian IV. Army very heavily. Giardino lost over 23,000 men, more than three-fifths of the total casualty list, which exceeded 35,000. The fighting on the river front was stiff at first, but the defenders were heavily out-gunned (their main artillery concentration was in the Grappa sector), and they were out-maneuvred and out-fought by the attacking infantry. They were already soundly beaten when the order to retreat was given. Some of the reserve units had shown a disinclination to move up to the front, and two brigades had previously been sent to the rear because they could not be trusted. The troops in reserve had been more affected than those in line by the news of the general breakdown in Austria-Hungary, and they had no stomach for what must have seemed to them a useless fight. But, on the whole, the Austrian soldiers showed a good spirit until obviously beaten.

**VIVIANI, RENE** (1863-1925), French politician, was born at Sidi-bel-Abbès, Algeria, Nov. 8 1863. While still a young man, he made a considerable reputation as a lawyer, and in 1893 was elected Socialist deputy for Paris. It was not until the close of his life that he left the Chamber to enter the Senate. In Oct. 1906 he was placed by M. Clemenceau at the head of the recently-created ministry of labour. In the following month he made a famous speech in the Chamber, in which he affirmed his atheistic belief. For these views he was often severely criticised subsequently. "We have put out the lights of heaven," he said, "and they will never be lit again." It was M. Viviani who was responsible for the law with regard to workmen's pensions. In July 1909 when M. Briand succeeded M. Clemenceau as Premier, M. Viviani continued to be Minister of Labour. In Oct. 1910, in consequence of the attitude adopted by the Government in regard to the threatened railway strike, he tendered his resignation, with the result that the Briand Cabinet was broken up and had to be re-formed. In Dec. 1913 he became Minister of Public Instruction in the Doumergue Cabinet.

In June 1914 M. Viviani became Premier and Minister for Foreign Affairs. He was on his way back from Russia with M. Poincaré when the Austrian ultimatum was issued against Serbia on July 23rd; this formed the prelude to the World War. On his return he immediately took affairs into his own hands; and it was he who decided to withdraw the French troops 10 km. behind the frontier in order to give proof of France's pacific attitude. When Germany declared war he made a magnificent speech in the Chamber which had an electrifying effect on his audience. On Oct. 29 1915 he was succeeded as Premier by M. Briand, in whose Government he became minister of justice. After the fall of the Briand Cabinet in March 1917 he no longer took any important part in public affairs. M. Viviani died at Clamart (Seine) on Sept. 7 1925 after a long and painful illness. His gifts as a speaker were remarkable; his eloquence, with its wealth of imagery and brilliant metaphor, has probably never been equalled in the French Parliament. But it was, above all, the rôle he played during the tragic events of July and Aug. 1914 which caused his name to go down to history. (P. B.)

**VLADIVOSTOK**, Russia (see 28.169), capital of Primorsk, a province of Union of Soviet Socialist Republics, now governed by a Soviet, had a population before the World War of 91,000, about one-third Chinese and the majority of European extraction. The closing of the Russian free customs zone in the Far East in 1909 and the subsequent disturbed conditions have had a most detrimental effect on trade; in 1925 a free port zone for transit traffic was opened in the hope of bringing improvement. (See JAPAN.)

**VOCATIONAL TRAINING.**—Logically, the term vocational training should include preparation for the practice of medicine, law and other professions; but it is convenient to restrict it to courses of regular instruction intended to fit boys and girls for commerce, domestic life or some branch of industry. The rapidly growing complexity of industry and commerce and the intensity of international competition compelled all the progressive nations to consider the provision of vocational training, in this sense, to replace or to supplement the methods of apprenticeship (*q.v.*) which sufficed in simpler times. It is, moreover, widely held that under the conditions of modern life, especially in great cities, some form of education, continued through the critical years of adolescence, is needed to preserve the physical, intellectual and moral health of the masses of the people; and vocational training, with its appeal to the practical interests of young wage-earners, is regarded as a particularly effective form for this purpose.

**Administration.**—In some countries vocational schools are administered as part of the general educational system. In England, for instance, they are provided by the ordinary local authorities for education and subsidised through the National Board of Education. In other countries vocational training is treated rather as a distinct educational function. Thus in the United States the Smith-Hughes Act of 1917 set up a Federal Board for Vocational Education, independent of the Bureau of

Education and charged with the duty of encouraging vocational training in the several states. In Wisconsin there have been, since 1911, distinct boards for general and industrial education with separate taxing powers; but so complete a division within a state is exceptional.

*Types of Courses.*—In the chief countries many large cities provide vocational schools offering "all-day" courses lasting from two to four years, sometimes in combination with a modified form of trade apprenticeship. These prepare pupils for office business and other commercial activities, or serve industries such as agriculture, engineering, furniture-making, upholstery, dressmaking, which offer scope for highly trained skill or taste, scientific or technical knowledge and capacity for leadership. But by far the greatest amount of vocational training is given everywhere in part-time continuation classes: *i.e.*, classes which provide a few hours of instruction per week for boys and girls who have left the elementary schools and have already entered upon some occupation. In parts of Germany and Czechoslovakia attendance at continuation classes, generally in the evening and on Sundays, was long ago imposed upon elementary school leavers; but the modern tendency, largely influenced by the pioneer work of Kerschesteiner at Munich is to require employers to release their young employees for instruction during working hours. In England and Germany laws making this system universal and compulsory have been adopted since the War, but financial difficulties in both countries prevented their coming into immediate effective operation. In the United States the effect of the Smith-Hughes Act has been to multiply part-time and especially evening continuation schools much more rapidly than all-day schools and in some states attendance is required by law.

In some countries "works schools," maintained by employers for the training of their employees, are an important supplement to the public provision for vocational education. They are especially numerous and well-organised in Germany, but in England and the United States met with some disfavour on political and educational grounds.

Finally, it should be noted that programmes of vocational training almost always include some teaching intended to continue and widen the student's general education. Instruction in the duties of citizenship is common, and in many cases attention is given to physical training and simple hygienic teaching.

Vocational training involves many matters that are still debated. These include the questions whether vocational schools should be organised for single trades or should offer a general industrial training, how far they should aim at technical training for its own sake or use it rather as a general educational instrument, and what mode and amount of co-operation is desirable with bodies representing commerce and the trades. As regards the age of training there is a strong disposition to postpone specific vocational teaching as long as possible, and to prepare for it by "pre-vocational" courses, practical in bias and outlook and having general cultural value. (T. P. N.)

**VOGAN, BORIS ANDREEVICH:** *see* PILNYAK.

**VOGT, HANS** (1890- ), German inventor, was born Sept. 25 1890 at Würnitz, Bavaria, Germany. He began his career as an inventor in the sphere of high frequency technology, telephone research and earth current telegraphy. In 1918 he began to collaborate with Joseph Massolle and Dr. Engl, and this led to the formation of the Triergon-Arbeitsgemeinschaft, which aimed at the creation of the speaking film. On Sept. 17 1922 the first public exhibition of the speaking film was held at the Alhambra in Berlin. The voice is photographed directly on to the film band after conversion of the acoustic oscillations, which are taken with an inertialess microphone (kathodophone), and are changed by a photoelectric cell into light pulsations. Reproduction is effected by an electrostatic telephone with mica membrane (statophone). An essential feature of the experiments was the effort to work as far as possible with inertialess elements, so as to secure the absolute coincidence of the mouth movement with the sound. From the speaking film, Vögt further developed a new process for the production of very loud gramophone records by first taking the photograph photoelectrically with

his apparatus and then engraving the gramophone plates while the film band was running off quite slowly. He found that with this arrangement the inertia of the gramophone needle did no harm, and could engrave deeply without any detriment to purity of tone.

**VOGÜÉ, EUGÈNE MELCHIOR,** COMTE DE (1848-1910), French author (*see* 28.172), died in Paris March 24 1910.

**VOICE SOUNDS** (*see* VOICE 28.172; PHILOLOGY 21.416; PHONETICS 21.462; RESPIRATORY SYSTEM 23.185; PHARYNX 21.359).—The human voice—as used in English and other European speech—can be produced in two different forms, namely (1) unvoiced, *i.e.*, breathed or whispered speech, and (2) voiced speech.

In unvoiced speech the vocal chords are more or less separated so that the air from the lungs passes continuously between them. In voiced speech the vocal chords are brought closely together so that the forcible passage of the air between them sets up a rhythmical vibration of the chords which causes the air to enter the vocal cavities in corresponding rhythmical puffs.

*Vowel Sounds.*—Until recently the accepted theory was that sounds like *i* as in *eat*, *e* as in *men*, *æ* as in *hat*, were each due to two separate resonances, that *a* as in *calm*, was produced in some voices by a single resonance, and in others by two resonances, and that *o* as in *all*, *ou* as in *no*, *u* as in *who*, were all due to single resonance (1). According to Helmholtz's theory (2) the lower series of double resonances is set up in the cavity behind the tongue, and the upper in a tubular neck formed by the tongue and lips, while in the case of the single resonant sounds, the whole oral cavity is supposed to act as a single resonator. Graham Bell, the inventor of the telephone, and K. J. Lloyd both held that all vowel sounds were due to double resonance (3).

Recent observations (4) have confirmed the views of Graham Bell and Lloyd, and shown that all the English vowel sounds depend primarily on two characteristic resonances—the one formed in the cavity in front of the tongue—*i.e.*, between the point of nearest approach of the tongue to the palate and the lips—and the other in the cavity behind the tongue—*i.e.*, between the same point and the vocal chords. Both cavities behave as Helmholtz resonators connected in series. Each can be independently tuned, by varying its capacity or by varying the size of its orifice to air and (or) to the adjoining resonator. Increase of capacity lowers the resonant pitch; of orifice raises it.

The following table shows typical resonances observed by ear in the whispered vowel sounds of the writer's voice, using the Southern English "Public School" pronunciation:—

*Vowel Resonances*

| Vowel Symbol | As in | Upper Resonance | Lower Resonance | Vowel Symbol | As in | Upper Resonance | Lower Resonance |
|--------------|-------|-----------------|-----------------|--------------|-------|-----------------|-----------------|
| i            | eat   | #d''' 2,434     | f' 342          | ä            | up    | #g''' 1,625     | #a'' 912        |
| ī            | it    | #c''' 2,169     | #f' 362         | a            | calm  | #d''' 1,217     | #g'' 812        |
| ei           | hay   | #c''' 2,169     | d'' 574         | e            | not   | #c''' 1,084     | #g'' 812        |
| ē            | men   | c''' 2,048      | #d'' 608        | o            | all   | b'' 966         | #f'' 724        |
| æ            | hat   | a''' 1,722      | #g'' 812        | ov           | know  | #a'' 912        | b' 483          |
| ə            | earth | #g''' 1,625     | e'' 645         | u            | who   | #f'' 724        | #f' 362         |
| ə            | sofa  | g''' 1,534      | e'' 645         | v            | put   | #a'' 912        | #d' 304         |

The resonances are given in musical notation and in number of complete vibrations per second (*c'* = middle *c* on the piano-forte, about 256 vibrations per second). In the series from *ə* to *v* inclusive, an additional high frequency component between 2,169 and 2,732 appears. The upper resonance of *i* to *ov* can be varied over a range of 5 to 8 semitones, and *u* and *v* by 10 semitones, while the lower resonances can all be similarly varied over a range of about 8 semitones (the other resonance, in each case, being kept nearly constant) without losing the vowel character. Comparable resonances have been found—using purely instrument methods—by Crandall and Sacia (5).

<sup>1</sup> The vowel symbols are those of the International Phonetic Association.

**Artificial Production of Vowel Sounds.**—Potter (6) experimentally reproduced the English vowel sounds by a reed attached to a spherical indiarubber resonator of suitable aperture which was appropriately compressed (while sounding the reed) so as to produce approximately the form of the human mouth cavity. All the English vowel sounds have recently been produced by combining two suitably tuned Helmholtz resonators in series and energising them by a continuous current of air, for unvoiced sounds, or by a pulsating current produced by a vibrating reed or equivalent for voiced sounds (7). The material of the resonators does not appreciably affect the vowel character. The additional high resonances are of secondary importance, since recognisable reproduction may be made without them. Artificial vowels have also been produced by J. Q. Stewart (8) and by Dr. Eccles (9), substituting electrical resonating circuits for acoustic resonators.

Diphthongs differ only from vowels in that their resonances change progressively from those of the initial to those of the terminal vowel which together form the diphthong. They can be reproduced by resonators of progressively variable pitch. Consonants also are produced in speech by resonance in the vocal cavities (10) (11). They differ from the vowel in that 1. they depend essentially on more than two resonances—due to the functioning of more than two cavities, 2. they depend (like the diphthongs) on characteristic movements of the vocal organs which produce corresponding changes of resonance and of amplitude (loudness), 3. the orifices of the resonators (or some of them) are more constricted than those in the case of the vowels, or are temporarily closed altogether and suddenly released as in forming the so-called plosives, p, b, t, d, k, g and the nasal consonants m, n and ŋ (ng), 4. the resonators are not always in series with the air current which energises them. Thus they may be in parallel—as when the air is passed simultaneously through both mouth and nose; or a resonator may be lateral to the air current, as when passage through the mouth is closed by the tongue or lips and the air passes behind the soft palate into the nasal cavity and out at the nostrils. In such cases the air current flows past the inner orifice of a lateral single-orificed resonator formed inside the mouth. Closure of the tongue against the back or the front of the palate produces a lateral resonator of high or medium pitch characteristic of the nasal consonant ŋ (ng as in hung); closure of the lips produces a lateral resonator of the maximum capacity and lowest pitch, characteristic of m.

The consonants can be artificially produced, like the vowels and diphthongs, by passing air (vibrating or not as the case may be) through resonators of variable number and capacity and/or orifice (10). In the cheirophone the variable multiple resonator is formed by the hands of the operator, so as to produce recognisable sentences (12). (See SOUND.) Certain consonants have also been reproduced by electrical resonance (8).

In the natural production of vowel sounds, the soft palate may be closed against the back of the throat so as to close the passage to the nasal cavity, or it may be drawn forward so as to open that passage more or less. The best quality of voice production appears to be obtained by avoiding nasal resonance, except in connection with the nasal consonants m, n, and ŋ (ng). In the French nasal vowels *ê* (pain) *â* (temps) *õ* (bon) *œ* (un) the nasal resonance is characteristic. The so-called nasal quality heard in English speech in parts of the North American continent appears mainly to depend on the formation of an additional resonator of high pitch by (unconscious) constriction of the pharynx (13). Broadly speaking, the voice sounds of human speech are due to characteristic postures (for vowel sounds) and gestures (for diphthongs and consonants) of the vocal organs—the tongue, lips and soft palate.

The function of the larynx, in voiced speech, is to increase the range of audibility (from about 10 to 20 times) by increasing the resonance of the cavities through or past which the air current flows. It also gives to speech the power of inflexion—i.e., of variation of the musical pitch of the voice, as in song. The unvoiced consonants s, f (sh), t, and θ (th as in thigh) and the

unvoiced aspirate, all of which carry no laryngeal energy and are incapable of emotional or musical inflexion, are inferior to all other voice sounds. (See SINGING.)

**VOLAPUK:** see UNIVERSAL LANGUAGE.

**VOLGA** (see 28.193). After many vicissitudes the waterborne traffic was (in 1926) beginning to regain its former importance. A great deal of dredging has been done, but many of the steamers and river ports are suffering severely from lack of adequate upkeep, though regular services are now maintained. Through the Mariinsky and Volga system, steamers now run from Leningrad to Astrakhan, and thence to Persian ports.

**VOLLENHOVEN, CORNELIS VAN** (1874- ), Dutch jurist was in 1901 appointed professor of colonial law in the University of Leyden. He achieved a wide reputation as an authority on the common law of the Dutch East Indies and in international law. His chief work is *Het adatrecht van Nederlandsch-Indië* (The Common Law of the Dutch East Indies; 1906-18). His other works include *Miskenningen van het adatrecht* (1909); *Drie treden van het volkenrecht* (1918); *De Indonesiër en zijn grond* (1919), and became president of the Royal Academy of Sciences at Amsterdam.

**VOLLMAR, GEORG HEINRICH VON** (1850-1922), German socialist (see 28.195), died on June 30 1922.

**VONDRAK, VACLAV** (1859-1925), Czech philologist, was educated at the University of Vienna, where he studied first romance philology and afterwards Slavonic languages. In 1893 he became lecturer on Slavonic languages and literature at the University of Vienna. He wrote a large number of works mainly dealing with Church Slavonic and its literature. Later he devoted himself largely to the study of comparative Slavonic philology.

His chief works are: *Allslovenische Studien* (Vienna, 1890); *Omluvě Jana Exarcha Bulharského* (Prague, 1896); *Studie Zoborní církevněslovanského písemnictví* (Prague, 1903); *Vergleichende Slavische Grammatik* (Göttingen, 1906-8).

**VOROSHILOV, KLEMENTIY** (1881- ), Russian soldier and politician, was the son of a workman. At the age of seven he began to work in the mines and only learned to read when he was 12 years old. He became a revolutionary in 1903, and in 1906 was a delegate to the Stockholm congress of the Bolsheviks. In the following year he was sentenced to banishment for organising strikes and similar activities, and in banishment, except for escapes and rearrests, he remained until 1914. His military career began in the Ukraine where he organised a detachment of partisans and carried on guerilla warfare against the German forces of occupation. Shortly afterwards he was commanding a small army and when it fought its way out, this army became the nucleus of the X. Red Army, the command of which was entrusted to Voroshilov. When the Germans left the Ukraine, Voroshilov became a member of the Ukrainian Soviet Government. He was later associated with Budenny as a member of the revolutionary military council of the I. Cavalry Army.

In March 1921, when the Kronstadt revolt broke out during the sitting of the tenth congress of the communist party, Voroshilov, together with other delegates to the Congress, went to Leningrad and took an active part in the suppression of the revolt. At the same congress he was elected a member of the central committee and in May 1921 was appointed to command the Northern Caucasian military district. In 1924 he was appointed commander of the troops in the Moscow district, and a member of the revolutionary military council of the Union. After the death

of Frunze in 1925, he became president of the revolutionary military council and commissar for military and naval affairs.

**VOSS, RICHARD** (1851-1918), German dramatist and novelist (*see* 28.215), died at Königsee, Thuringia, July 10 1918. The following works by him have been published since 1910:

*Erdenschönheit: ein Reisebuch* (1911); *Brutus auch Du!* (1917); *Das Haus der Grimani* (1917); *Aus meinem Reisebuch Skizzen und Stimmungen* (1918); *Erinnerungen* (1920); *Der Erlösung etc.* (1921); *Bergasyl* (1922); *Alpentragödie* (1923).

**VOTING:** *see* ELECTORAL LAWS.

**WAALS, JOHANNES DIDERIK VAN DER** (1837-1903), Dutch physicist, was born at Leyden Nov. 23 1837. He first attracted notice in 1873 with his treatise *Over de continuïteit van den gas-en vloeistoftoestand* (On the continuity of the gaseous and liquid state) by which he gained his doctor's degree. In 1877 he was appointed professor of physics in the University of Amsterdam, a post which he retained until 1907. In 1880 he discovered the "law of corresponding states" which aided Dewar in the liquefaction of hydrogen and Onnes in that of helium. His third important discovery was that of the law of mixtures. In 1910 he was awarded the Nobel Prize for physics. He died at Amsterdam March 9 1923.

**WACE, HENRY** (1836-1924), Anglican divine (see 28.224), died at Canterbury Jan. 9 1924.

**WAGES** (see 28.229).—In the following section, which should be read in connection with the articles on COST OF LIVING and PRICES, the movements of wages in the period 1914-26 are considered. During the 10 years preceding 1914 average money wages had risen about 10%, a rise which was completely neutralised by the synchronous rise of prices, and in 1914 there were agitations for increases of wages which were discontinued at the outbreak of war. (See also INSURANCE, SOCIAL.)

### I. IN GREAT BRITAIN

*Rates of Wages and Earnings.*—In the movement of wages it is specially important to distinguish between rates of wages and earnings. Rates of wages are time rates, sums payable for work in a definite time (an hour, a week consisting of a recognised number of hours or, rarely, a longer period), or piece-rates (sums payable for the performance of a definite task, or as additions to or in combination with time-rates, when the rate depends both on the quantity produced and the time taken in producing it). Earnings are the sums actually received by an employee, generally computed for a week or a year; the term is used specifically when the amount received on piece rates is in question, and is also used to include payments for overtime in the case of time workers. Time rates are generally stated for the normal week, or, if the rate is an hourly one, as in the building trades, both for the hour and for the normal week; to get a comparable statement for piece-rates it is necessary to compute the average earnings of a number of men who worked normal hours. In modern times a statement of time rates generally relates to rates agreed to by associations of employers and employees, often as the result of arbitration; these are frequently minimum rates, and the relation between minimum rates and the average of those actually paid to a group of workpeople can only be ascertained by special inquiries such as those undertaken by the Board of Trade in 1886 and 1906.

The assumption has to be made that between such inquiries average rates have kept the same proportion to minimum rates, which is only true over a short period and in the absence of disturbing causes.

For piece payments the assumption that earnings move by the same percentage as the rates can never yield more than an approximation to the facts, and during the War such an assumption would be completely invalid even if reference was only made to earnings in a normal week, since there were very important changes in facilities for production, in the effort put into the work and in the nature of the work. In the absence of any general information about earnings, statistics in the war period must be confined to statements of time and piece-rates, which do not give a true picture of the economic position of the working class in that time; in 1920, however, industry was more nearly normal and overtime was relatively uncommon, so that a comparison of rates between 1914 and 1920 or more recently is not altogether misleading. In making such a comparison the general reduction of hours in 1918 and 1919 must be borne in mind; usually at the dates of reduction piece-rates and hourly rates were raised so as to give approximately the same earnings for the reduced as for the longer week, and weekly rates were the same before and after the reduction, but in some industries an increase for the week was arranged at the same time.

*Movement of Wages.*—From early in 1921 till the end of 1925 unemployment was serious, especially in the engineering and shipbuilding industries, and after the middle of 1924 in coal-mining, and therefore average earnings of all workpeople had increased less than is shown by the index numbers given below. The movement of wages is shown in the following table, where it is illustrated by the changes in eleven important industrial groups. Up till 1919 the general average given is the simple average of the lines above; afterwards it is that stated from time to time in *The Ministry of Labour Gazette*, where it is roughly computed on the basis of all changes known to the Ministry.

It is important to realise that the table deals only with changes in rates, except in the case of miners, where the average earnings per shift of all employed is the basis, and these rates refer to whatever was the recognised normal week at the time of record. Rates rose very gradually in the first two years of the War, then more rapidly to the date of the Armistice. After a slight pause there was a great increase during the boom period of 1919-20; the maximum was attained at the end of 1920, after the general recession of prices had begun, and the subsequent fall only became marked at the date of the coal strike in April 1921. Reductions were very rapid for about 18 months, till at the end of 1922 stability was attained at about 70% above the pre-War

*Estimate of Movements of Time-rates or Piece-earnings (for the normal week at each date) in the United Kingdom, 1914 to 1926*  
(Expressed as percentages of rates in 1914 for each industry.)

<sup>1</sup> August. <sup>2</sup> Strike.

rates; the movements during the three years from 1923 to the end of 1925 were almost insignificant.

*Real Wages.*—Comparison with the cost of living index suggests at first sight that real wages (*i.e.*, wages measured by their purchasing power) fell in the years 1914–7 and rose from 1917 to 1920; actually it is probable that the effective rise in the cost of living was less than measured by the index number till perhaps 1921, and that the reduction of unemployment and prevalence of overtime maintained real earnings from soon after the beginning of the War till the Armistice, and that they were substantially increased during the subsequent boom. For a short period during and after the winter of 1920–1 wages maintained their advantage, but from the middle of 1922 onwards the wage index is practically identical with that of the cost of living. (*See COST OF LIVING: diagram.*)

The general gain during 10 years was a reduction of hours of work by about 10%, with no change in the real wages received. The average of the particular industries included in the table, however, shows a gain of 5% of weekly wage rates over prices. It is evident that there are important divergences from the average. These are due to two causes: the upward movement of unskilled relative to skilled wages, and the failure to maintain high rates in industries specially dependent on foreign markets. The bonuses granted during the War (especially in the earlier years) were generally in the form of flat increases to all operatives to meet the increased cost of food, which gave a greater relative increase to the unskilled man. Thus in 1914 the hourly wage of a bricklayer and his labourer was 11½d. and 8d. respectively, but in 1920 was 28d. and 25d., so that the bricklayer's hourly wage had increased 143% and the labourer's 212%; further, whereas before the War (and indeed during practically the whole of the 19th century) the labourer's wage had been two-thirds of the artisan's, it was for a short period in 1920 89/100 of it; subsequent reductions were greater in the labourer's wage, and at 21½d. and 16½d. in 1925 respectively the proportion four to three had been nearly reached. Meanwhile, summer weekly working hours were reduced from 50 in 1914 to 44 in 1920. This example is illuminating, because the nature of the work done has not changed. A similar contrast, originating in the same way, is found between the increases in the engineering artisan's and labourer's rate.

*Unskilled Labour.*—Rates for other unskilled labour, if naturally sheltered from foreign competition, such as work for local authorities, at docks and on railways, increased to about the same extent as those of builders' labourers. Part of the optimistic programme after the Armistice was to give a permanent lift to wages in industries which were regarded as underpaid before the War; notably to railwaymen, agricultural labourers and women in the less organised trades; and generally there was an attempt to determine wages according to needs as well as according to the market value of the work. Railway wages were fixed at the beginning of 1920 at a level well above that commensurate with the cost of living, and it was arranged that they should rise and fall in proportion to that cost on the basis of the higher standard established. In agriculture minimum wages were established in the summer of 1918, and raised step by step, till in Aug. 1920 they averaged at least 160% above the pre-War level. Subsequently, in face of the great fall in the world's prices of food, the legal minimum was abolished in Sept. 1921, and wages in 1923 and 1924 fell to a low level; in the summer of 1924 the Agricultural Wages Act re-established minima with a county organisation and wages rose early in 1925. Women's wages in 1926 appeared to be at about double the rates of 1914.

*Engineering, Textiles and Coal.*—The most conspicuous example of a fall in real wages is that of engineering artisans, whose weekly time-rates show a net rise from about 39s. in 1914 to 56s. or 57s. in 1923; the standard rates in all towns have been increased by 7s. or 8s. and by a bonus, reduced to 10s. in 1923, amounts which apply to labourers and machine-men as well as to fully skilled men. Piece-workers have done better. As a contrast to this the skilled men in the "sheltered" trade of printing have more than doubled their time-rates.

In the woollen industries the wage changes have been very complex, and it is doubtful what the exact average effect has been. Cotton wages afford an example of the changes in an industry where piece-rates are general. In July 1914 the piece-rates were 5% above the standard list; by May 1920 rates were 215% above the standard, 30 points of the rise being awarded to compensate the reduction of hours from 55½ to 48 weekly; by March 1923 they had fallen to 95 above standard. If the output per hour before and after the reduction of hours had been exactly the same, the earnings at the maximum date would have been  $\frac{315}{105} \times \frac{48}{55\frac{1}{2}} \times 100 = 259\%$  of those in 1914, and from March 1923 onwards  $\frac{195}{105} \times \frac{48}{55\frac{1}{2}} \times 100 = 160\%$ ; the numbers in the table are

calculated on this basis. In fact, the output per hour has probably increased and full time earnings increased by about 80%, but earnings have been very seriously affected by short time.

The history of coal wages is too complicated for treatment here, and must be studied in the various Royal Commissions that have recommended regulations and rates. Earnings per shift, as officially computed, have increased more than nominal piece-rates, owing to the existence of a minimum wage and other circumstances; but their change differs greatly from district to district, so that in 1925 in some districts the increase over 1914 in money earnings was somewhat greater than the rise in prices, and in others much less than that rise. (*See COAL.*)

*Standardisation of Rates.*—Alongside the wage changes now discussed there has been a movement towards standardisation of rates throughout Great Britain, in which wages in the worse paid districts have been raised the most—the effect of which is not completely shown in the table—and towards wage bargaining on a national basis in which the relative standards are nominally preserved; but with each flat change (*e.g.*, an increase of 3s. to compositors in all districts) the relative rates are disturbed. Further, there is a continual shifting of the relative numbers engaged in the various occupations and industries, and over the period a definite change in the proportions of men to women, boys and girls. The result of these movements, combined with alterations in piece-rate systems, is to make an accurate measurement of the change in average full time earnings of all workers impossible, at least until an adequate wage census has been taken.

## II. IN THE UNITED STATES

The beginning of the second decade of this century found the wages of working people lower, both in dollars and cents and in purchasing power, than they are in 1926. The wages of unorganised and unskilled workers were considerably lower than the wages of unionised and skilled workers and the wages of women workers were particularly low.

A study made in 1914 of women's wages in the United States concluded that 75% of the female wage-earners received less than \$8 weekly and 50% received less than \$6 and that these wages were further reduced some 20% by lost time and unemployment. The New York State Factory Investigating Committee examined the payrolls of over 2,000 stores and factories during 1913 and 1914 and found that out of 57,000 women and girls, 60% earned less than \$8 a week. Of 14,000 married men, 7,000 earned less than \$15 a week. The causes of these low wages were numerous: There were no strong labour organisations among this group of wage-earners; unmarried women wage-earners felt that their work was only temporary and married women usually had other sources of income; employers failed to recognise a relation between wages and productivity; the constant stream of immigrants furnished an abundant supply of labour willing to work for low wages and made unionisation of them difficult because of their divergent languages and customs.

During the World War wage rates and money earnings rose appreciably, but owing to the great rise in prices the real earnings

expressed in purchasing power did not materially gain and some studies show that it actually declined. During the period following the War and especially after 1920 a material improvement seems to have taken place in real earnings. During this post-War period the cost of living has been declining, while, in some industries, wages have advanced and in most industries they have not shown any marked decrease from their War-time level.

Mr. Ethelbert Stewart, U.S. Commissioner of Labor Statistics has recently prepared some figures which indicate this course of real earnings. Table I is adapted from his study.

TABLE I. *Union Wage Rates and Cost of Living*  
1910-25  
(1913 = 100)

| Year | Index number of union rates of wages per hr. | Index number of cost of living | Relative purchasing power of wages as measured in cost of living |
|------|----------------------------------------------|--------------------------------|------------------------------------------------------------------|
| 1910 | 94.4                                         | 93.0                           | 101.5                                                            |
| 1911 | 96.0                                         | 92.0                           | 104.3                                                            |
| 1912 | 97.6                                         | 97.6                           | 100.0                                                            |
| 1913 | 100.0                                        | 100.0                          | 100.0                                                            |
| 1914 | 101.9                                        | 103.0                          | 98.9                                                             |
| 1915 | 102.8                                        | 105.1                          | 97.8                                                             |
| 1916 | 107.2                                        | 118.3                          | 90.6                                                             |
| 1917 | 114.1                                        | 142.4                          | 80.1                                                             |
| 1918 | 132.7                                        | 174.4                          | 76.1                                                             |
| 1919 | 154.5                                        | 188.3                          | 82.0                                                             |
| 1920 | 199.0                                        | 208.5                          | 95.4                                                             |
| 1921 | 205.3                                        | 177.3                          | 115.8                                                            |
| 1922 | 193.1                                        | 167.3                          | 115.4                                                            |
| 1923 | 210.6                                        | 171.0                          | 123.2                                                            |
| 1924 | 228.1                                        | 170.7                          | 133.6                                                            |
| 1925 | 237.9                                        | 173.5                          | 137.1                                                            |

It will be noted that this table is based on hourly rates of wages in unionised industries. Since it is constructed on hourly rates it does not take unemployment into account. It indicates what workers would receive if their employment were constant. As yet no study of American wages has been made which takes into account unemployment. In 1918 a canvass of some 12,000 families living in 92 localities in the United States was made and a typical wage-earner's family budget was drawn up. The index number of cost of living in Table I shows the fluctuations in price of commodities included in this budget.

In order to have some idea of the trend of real earnings in unorganised industries, Mr. Stewart prepared similar figures for three unorganised or only partly organised industries. Table II. indicates the trend in these industries.

TABLE II. *Real Earnings in Three Unorganised Industries*  
1910-25  
(1913 = 100)

| Relative Purchasing Power of Wages Measured in Cost of Living |                         |               |              |
|---------------------------------------------------------------|-------------------------|---------------|--------------|
| Year                                                          | Boot and Shoe Factories | Woollen Mills | Cotton Mills |
| 1910                                                          | 98.9                    | 96.8          | 94.6         |
| 1911                                                          | 102.2                   | 98.9          | 97.8         |
| 1912                                                          | 95.3                    | 104.5         | 101.4        |
| 1913                                                          | 100.0                   | 100.0         | 100.0        |
| 1914                                                          | 98.1                    | 100.0         | 100.0        |
| 1915                                                          | ..                      | ..            | ..           |
| 1916                                                          | 91.3                    | 107.4         | 101.4        |
| 1917                                                          | ..                      | ..            | ..           |
| 1918                                                          | 80.3                    | 110.7         | 102.6        |
| 1919                                                          | ..                      | ..            | ..           |
| 1920                                                          | 111.3                   | 170.3         | 155.4        |
| 1921                                                          | ..                      | ..            | ..           |
| 1922                                                          | 124.3                   | 160.2         | 132.7        |
| 1923                                                          | ..                      | ..            | ..           |
| 1924                                                          | 125.4                   | 176.3         | 147.0        |

From these figures it appears that non-union wages have gained more proportionately than have union rates, but it must be remembered that they started from a considerably lower level, e.g., the average union wage rate in 1913 was 45.9c. per hour and \$1.09 in 1925; the average wage rate in cotton mills in 1913 was

14.8c. per hour and 37.2c. in 1924; the average rate in woollen mills in 1913 was 17.7c. and 53.3c. in 1924; the average wage rate in the boot and shoe industry was 24c. in 1913 and 51.6c. in 1924. It should also be noted that in the unionised occupations there are practically no women, while in these three industries both women and men are employed.

Mr. Stewart's calculations are based upon wage rates. Another method of approaching this problem of the trend of purchasing power of wages is to study annual earnings of employed workers. This has been done recently by Prof. Paul H. Douglas of the University of Chicago. Prof. Douglas has calculated the average yearly earnings of employed workers in several industries and deflated these figures by a cost of living index so as to get at the purchasing power of money wages. His study, like that of Mr. Stewart, does not take unemployment into account. Table III. summarises his findings:—

TABLE III. *Money Value and Purchasing Power of Average Annual Earnings of Employed Workers in Manufacturing and Transportation*  
(1914 = 100)

| Year | Index of Cost of Living | Average Annual Earnings of Employed Workers |         | Relative Purchasing Power of average annual earnings as measured in cost of living |         |
|------|-------------------------|---------------------------------------------|---------|------------------------------------------------------------------------------------|---------|
|      |                         | Manuf'g                                     | Transp. | Manuf'g                                                                            | Transp. |
| 1910 | 92.0                    | \$ 558                                      | \$ 678  | 104                                                                                | 93      |
| 1911 | 94.9                    | 537                                         | 702     | 97                                                                                 | 94      |
| 1912 | 95.6                    | 550                                         | 714     | 99                                                                                 | 95      |
| 1913 | 98.5                    | 578                                         | 752     | 101                                                                                | 97      |
| 1914 | 100                     | 580                                         | 787     | 100                                                                                | 100     |
| 1915 | 98                      | 568                                         | 806     | 100                                                                                | 104     |
| 1916 | 107                     | 651                                         | 858     | 105                                                                                | 102     |
| 1917 | 129                     | 774                                         | 972     | 104                                                                                | 96      |
| 1918 | 157                     | 980                                         | 1379    | 108                                                                                | 112     |
| 1919 | 179                     | 1158                                        | 1492    | 111                                                                                | 106     |
| 1920 | 205                     | 1358                                        | 1785    | 114                                                                                | 111     |
| 1921 | 176                     | 1180                                        | 1619    | 116                                                                                | 117     |
| 1922 | 166                     | 1149                                        | 1567    | 120                                                                                | 120     |
| 1923 | 169                     | 1254                                        | 1575    | 128                                                                                | 119     |
| 1924 | 169                     | 1256                                        | 1572    | 128                                                                                | 118     |

The wages of transportation workers have been higher than the wages of manufacturing workers throughout the entire period. But the lower paid manufacturing workers have made greater proportional gains than have the transportation workers. The transportation workers are still better off, but their differential over the manufacturing group is smaller than before the War. This is the same development which was observed above in the comparison of union and non-union rates. Neither the manufacturing nor the transportation workers gained in purchasing power during the War. The first gain came during the closing year of the War and considerable improvement has occurred during the post-War years.

A number of factors have probably contributed to this increase in purchasing power of wages. There has been a great increase in the total annual production of the country. Not only has the total production of the country increased, but the amount per wage-earner has increased. Technological improvements have been made, processes perfected and efficiency increased. In 1909 the index of output per wage-earner stood at 140 while in 1923 it had reached 152. This increased product has made the payment of higher money wages possible and has tended to lower the cost of living. In addition to this, there has been a marked decline in the value of farm products in recent years and this has made for a lower cost of living. In 1919 the purchasing power of farm products has been calculated at 102. By 1923 it had declined to 87. The lower farm products go in value the more of them the worker's wages will purchase and the greater the real earnings of the worker will be.

Another major factor which has increased the well-being of the working class is the decline in immigration. The immigrant has always underbid the American worker, depressed the wage level and been difficult to unionise. This leads one to ask if trade unionism has had anything to do with this recent increase in earnings.

The proportional gains have probably been greater in the unorganised than in the organised trades and in addition to this the membership and funds of trade unions have declined during the period of the wage increases. But this is not conclusive evidence that trade unionism has been of no value. In the first place, a rise in wages in the unionised industries is bound to increase the wages in non-union industries unless a great surplus of labour prevents it. Further, there is a growing practice among employers, in unorganised industries, of paying higher wages in an effort to keep the union out of their industries and we must not overlook, as was explained above, that the non-union wage increases began at a much lower level than union wages. In the second place, the decline of union membership and funds largely represents a partial contraction of the inflated War-time membership. If these developments are taken into consideration, it would seem more accurate to place trade unionism along with the other factors as one of the causes of the recent increase in real earnings.

(J. R. Co.)

**WAGNER, ADOLF** (1835-1917), German economist (see 28.235), died in Berlin Nov. 8 1917.

**WAHHABI** (see ARABIA 2.263).—In 1900 'Abdul 'Aziz, the son of 'Abdulrahman the exiled fourth son of Faisal, conceived the idea of re-establishing the dynasty of his ancestors. By a bold stroke he captured Riyadh. Slowly but steadily he recovered the lost provinces, and by 1914 he ruled the territories of Faisal except the Hasa province which by a surprise attack he captured from the Turks at the beginning of that year. Meanwhile he had begun to consider his plans for the future, and, being ambitious to extend his rule to the limits of the first Wahhabi Empire, he not unnaturally based his scheme on the project of an intensive revival of the Wahhabi creed. History taught him that the weakness of such a creed lay in the impossibility of keeping it at white heat among the shifting elements of a nomad society, easily wearied by ceaseless effort. It taught him at the same time—witness the experience of Ibn Rashid—that the naturally centrifugal character of Arabian society would defy any attempt at permanent empire-building without the impetus of religious emotion. To give permanence to such an emotion it was necessary to change the essential character of the nomad tribes with which he had to deal, and history again taught him that, if land was available to settle in, the nomad would naturally turn to a sedentary life of agriculture—witness the populations of Syria and 'Iraq recruited from time immemorial from the ranks of the Arabian Bedouin (Bedawin).

*Settlement of the Nomads.*—His scheme was no less than to tempt the nomads to settle in villages under the influence of religious fervour and to hold them in their new life by the ties of agriculture. His difficulty was to find cultivable land not already occupied and water to water it withal, but the success which has attended his efforts may be judged from the fact that in 15 years some 50 villages have been founded in Central Arabia with a population probably not far short of 50,000 souls in the aggregate. The first of such villages, 'Artawiya in Eastern Najd, was founded in 1912 and served as a model for others following in rapid succession. The nucleus in each case was a mosque provided for from state funds which also provided the inhabitants with rifles and the services of a religious teacher. For the rest they set themselves to build houses, dig wells and cultivate the land. As each community took root it became automatically a territorial contingent of Ibn Sa'ud's standing army. On these contingents, fearless and ferocious, Ibn Sa'ud has mainly relied in the furtherance of his imperial ambitions, while retaining in reserve the citizen contingents recruited from the towns on a conscription basis.

*Tenets of the Ikhwan.*—The *Ikhwan* (brothers), as these village communities are called, purport to follow in detail the practice of the Prophet, and regard as infidels all who do otherwise. Their enemies are the enemies of the true faith and their every campaign is therefore a *Jihad* (holy war), death in which is a sure passport to Paradise. Another feature of these communities is the complete elimination of all tribal distinctions. The old pastime of tribal raid and counter-raid is discountenanced. The

blood-feud is no more. And the Bedouin generally are rapidly becoming permeated by the *Ikhwan* spirit to such an extent that the nomad tribes of Central Arabia may be regarded as a single religious fraternity where natural *points d'appui* are the numerous *Ikhwan* settlements in their midst. The settled town communities of Nejd are Wahhabi in spirit and in practice, but cannot be regarded as forming part of the inner circle of the faith, which only comprises the Bedouin whether settled or nomad. In the matter of doctrine the Wahhabis (*Ikhwan*) differ from their fellow-Moslems in rejecting a large mass of tradition which they regard as un-authentic. Like all Moslems they regard the Koran (Quran) as the Word of God and therefore the foundation of their social code, but there is admittedly much in the Koran and much not in it which from the earliest days of Islam required explanation or consideration. Such matters were freely dealt with by the Prophet in conversation or in his practice, the records of which were subsequently collected in the form of "Traditions of the Prophet" which, being generally handed down by word of mouth, grew in volume as time progressed. And it was freely recognised that the authenticity of some traditions was less well established than that of others.

The various schools of Sunni Islam owed their existence to differences of opinion on such matters, but the basis of the Wahhabi faith is exclusive reliance on only two collections of Traditions (those of Al Bukhari and Al Muslim), whose authority is admitted by all schools, and the rejection of all else in respect of which there is doubt. Thus the Wahhabi interpretation of the creed of Islam is common ground to the whole of Sunni Islam (except for its specific denunciation of the use of tobacco), whose other schools differ from it in allowing a greater laxity of belief and practice on the strength of traditions whose authenticity is in dispute. The Wahhabi movement is therefore quite aptly recognised as a Puritan movement within Islam. For bibliography, see ARABIA. (H. St. J. B. P.)

**WALES, PRINCE OF:** see EDWARD, PRINCE OF WALES.

**WALES** (see 28.258), had in 1921 a population of 2,206,712. In the years immediately preceding the outbreak of War in 1914, Wales was deeply distracted by acute political divisions and widespread industrial unrest. Historical, physical and other conditions peculiar to Wales tended to aggravate anxieties and uncertainties prevalent throughout the United Kingdom. The prospect of the settlement of the grave constitutional crisis that had arisen between the two Houses of Parliament intensified interest in measures of a highly controversial character which directly concerned Wales as a national entity. Thus, the disestablishment and disendowment of the Church of England in Wales had been the most constant and, usually, the most prominent issue in Welsh elections since 1868. The demand for Welsh autonomy, either as an independent measure or as part of a general scheme of federal devolution, had been attracting interest and support. Such proposals found their strongest response in those parts of Wales—the North and West—where the great bulk of the population was Welsh in speech and tradition and nonconformist in creed.

*Urbanisation.*—But the centre of interest in the life of Wales had been establishing itself definitely in the northeastern and southeastern regions, with their growing concentration of population and productive wealth. These regions were becoming intensely industrialised, and the process was extending steadily up the valleys. Rural depopulation was proceeding at an accelerating rate, with a concomitant decay of agriculture and of rural life generally. In the first decade of the century the rural population of Wales declined by about 27%. Of the twelve counties in England and Wales, which in 1911 had the smallest number of inhabitants to the square mile, seven were Welsh "rural" counties. These showed an absolute decrease in the density of population found in two only of the five English counties included in the same list. Owing to the relatively unattractive conditions of agricultural labour, the proximity of the "Works," the decay of tillage and the consolidation of holdings to form large sheep runs, the manhood of the rural areas was steadily draining into the urban centres and mining valleys of industrial

Wales. South Wales with a population rapidly growing, largely through immigration from rural Wales, from all parts of the British Isles and even from foreign countries, was becoming a vast and closely knit industrial community. Men representing a variety of national and cultural traditions found in their economic condition the only basis of mutual understanding, of common action and, in short, of a growing class consciousness. The coal miners formed much the largest body of workers engaged in a single industry in Wales and Monmouthshire (251,400 in 1911). The steady advance in the cost of living, clearly marked for some years before the War and the fermenting of new ideas kept the community in a state of unrest which frequently issued in trade disputes concerning the remuneration and conditions of labour. Moreover industrial Wales was acquiring great influence in the world of British industry.

*National Consciousness.*—The national identity of the Welsh people received striking official recognition a month after the coronation of King George V., when the King's eldest son was formally invested with the title and insignia of Prince of Wales in a full representative Welsh Assembly in Carnarvon Castle. The ceremony of investiture, occasionally witnessed in the English Parliament in the Middle Ages, was then, for the first time, performed in Wales and in a Welsh assembly. The claim of Wales to separate treatment on the ground of special conditions resulting from her distinctive historical development has since received practical recognition in some of the great administrative measures passed by the Imperial Parliament. Thus, a Welsh Commission with headquarters in Cardiff, was made responsible for the administration in Wales of the National Health Insurance Act (1913). Under the same Act the campaign against tuberculosis was entrusted to the King Edward VII. (Welsh) National Memorial Association. Some of the measures of reconstruction and development passed in the post-War period are likewise administered in Wales on a national basis. That Welsh national consciousness, evidenced by the demand for administrative autonomy and by the claim for legislative autonomy in Welsh affairs (Welsh Home Rule Bill, April 1914) is not incompatible with the fundamental unity of the British Commonwealth was conclusively demonstrated in the World War, 1914-8.

*Welshmen in the War.*—In proportion to the population Wales sent the highest number of volunteers to the British fighting forces. Welsh troops, including considerable numbers of monoglot Welshmen, served on the fighting fronts of three continents. At home some of the gravest burdens of official life were borne by Welshmen. At the close of 1916 the supreme direction of affairs was entrusted to a Welsh speaking Welshman, Mr. D. Lloyd George. Lord Rhondda, long a leading figure in industrial organisation in Wales, subsequently undertook the control of the distribution of the food supplies of the country.

#### RELIGION AND EDUCATION

*Religion.*—In 1914 the Bill for the Disestablishment and Disendowment of the Church of England in Wales passed the Imperial Parliament. It provided that the secularised portion of the endowment of the Church should be applied to specified national purposes mainly educational. An amending Act (Sept. 1919), which revised the financial provisions of the original Act, definitely closed a long and embittered struggle. "The Church in Wales" faced the problem of reconstruction with energy and marked success. The task of framing a constitution, begun in 1917, was completed in 1922. Under this Constitution the supreme authority is vested in the Governing Body, an assembly fully representative of the Clergy and laity of "the Church in Wales." Diocesan, rural dean and parish assemblies, constituted on the same principle, exercise delegated powers within their respective areas. The representative body holds and, in general, administers all the property of the Church. In 1920 the Bishop of S. Asaph (Dr. A. G. Edwards) was elected the first Archbishop of Wales, it being laid down by the Constitution that "the Office of Archbishop shall be held by a Diocesan Bishop of the Church in Wales." The speedy creation of two

new dioceses (Monmouth, 1921; Brecon and Swansea, 1923) demonstrates the high measure of statesmanship in counsel and vigour in action possessed by the reconstituted Church.

Meanwhile the Nonconformist bodies were gradually drawing closer together under the general style of the Free Churches, which, after the Disestablishment of the Church, was replaced by that of the Evangelical Churches. The need of closer union was felt and emphasised on all sides, and the Evangelical Churches readily found in several directions opportunities for whole-hearted co-operation. But the attempt to maintain a national organisation representing all the Churches (the Welsh National Council of Evangelical Churches) has, so far, not proved conspicuously successful. Although the Welsh Baptists still maintain the Close Communion and, therefore, remain officially outside the movement for the union of the Churches, the deepening consciousness of the fundamental unity of spirit and aims is profoundly affecting the mutual relations of the Church in Wales and the various Evangelical Churches.

The Roman Catholic Church, represented in industrial Wales by large communities mainly recruited by immigration from Ireland and by scattered communities of native tradition in the border counties, steadily extended its organisation.

*Education and National Culture.*—The Intermediate Education Act (1889) had given to Wales a system of public secondary education and had led to the creation of a representative national body, the Central Welsh Board, charged with the inspection and examination of the schools. In 1894 the three colleges of Aberystwyth, Cardiff and Bangor were, by Royal Charter, constituted into a national University of Wales. To supervise the administration of the various Education Acts a Welsh Department of the Board of Education was set up in Whitehall in 1907. Thus for some years before the War the administration of education in Wales had been largely national. The National Library of Wales was founded in Aberystwyth in 1911 and the National Museum of Wales in Cardiff in 1912.

The final report of the royal commission on the universities under Lord Haldane's chairmanship was issued in 1918. While approving the continuance of a single national university for Wales, it contained recommendations of the greatest importance to the university and to Wales. A Supplemental Charter (1920) enabled the university to be reconstituted in accordance with the recommendations of the commission. The new Constitution is broadly based on national and popular support. In the university court which is the governing body, a majority is ensured to the representatives of the Welsh county and county borough councils. The local authorities contribute a penny rate to the support of the university, which receives an equal sum from the Imperial Exchequer. Through sub-committees of the court, e.g., the council of music, the board of Celtic studies and the extension board, the university directly fosters educational and cultural activities over the whole of Wales, etc. In 1925 the colleges were responsible for the work of 130 "extramural" classes (university tutorial and preparatory classes) engaged in the systematic study of a considerable variety of subjects both in the great industrial centres and in the remote country villages. The university College of Swansea was established in 1920 as a fourth Constituent College of the university. Local interest and support secured for the applied sciences a strong position among the studies prosecuted in the new college. The Representation of the People Act (1918) created the University of Wales a Parliamentary constituency represented by one member.

Meanwhile a departmental committee had been set up by the Board of Education to inquire into the organisation of secondary education in Wales. The most significant of the recommendations included in its *Report* (1920) was that there should be established a National Council of Education for Wales. This proposal gained considerable support. It is probably the most generally acceptable of the various schemes (Home Rule, Devolution, Secretary for Wales) advanced in recent years with a view to increasing Welsh autonomy. It is usually interpreted to mean the creation of a separate and autonomous authority in Wales for primary, secondary and university education.

*Language and Literature.*—In these years the demand for the fuller recognition of the language, literature and native culture of Wales in all branches of public education has been urged ever more insistently. The 1918 Education Act, which required local education authorities to prepare schemes of instruction adapted to suit the requirements of their respective areas, led to a considerable extension of the use of the Welsh language in the schools, notably in the industrial region of South Wales. A departmental committee of the Board of Education was set up in 1925 to inquire into the position of the Welsh language in the schools and colleges of Wales.

The movement in favour of the greater utilisation of the native language and traditional culture derives its strongest impulse from the Welsh Churches and from the Sunday schools, the Eisteddfod, the literary society and the Cymmrodion societies. More recently the Welsh Drama movement has powerfully reinforced the older organisations and has, in addition, provided a new interest of cultural value. Contemporary Welsh literature surpasses, in volume, breadth of outlook and quality, that of the 19th century. The influence of the scholars and writers trained in the national colleges is clearly discernible in this revival and development of the Welsh literary tradition.

#### RURAL AND INDUSTRIAL CONDITIONS

*Rural Life.*—A Welsh agricultural council was established before the War to keep the Board of Agriculture in touch with the particular needs and interests of the industry in Wales. There was, however, a growing conviction that the adequate treatment of the agricultural problems of Wales required the creation of a Department of Agriculture for Wales with resources and powers similar to those possessed by the Scottish and Irish Departments. In 1901 the Agricultural Co-operative Movement spread from Ireland into Wales. At the end of 10 years societies were to be found throughout the country with a membership of 6,000. The transactions of the societies represented a sum of over £200,000 in 1912. This rapid expansion was confined almost exclusively to the distributive phase of the movement. The average size of holding in Wales was 47 ac. and the smallholders were quick to grasp the advantage of co-operative purchasing of foodstuffs, implements, etc. The co-operative marketing by a few societies of dairy produce in West Wales and of wool in North Wales represented the productive side.

The prosperity of agriculture during the War strengthened the demand for improvement in the remuneration and working conditions of land labourers. Organisation spread rapidly among the farmers and farm labourers. The Agricultural Labourers' Union made great progress. Numerous branches of the Farmers' Union were formed, and in 1918 an independent Welsh Farmers' Union was established. Before the close of that year minimum wages for agricultural labourers had been fixed by law.

Social and economic changes have altered largely the structure and outlook of the life of the Welsh countryside since 1911. The breaking up of landed estates after the War enabled large numbers of Welsh farmers to acquire the freehold of their farms. The application of more scientific methods to all branches of farming and the extension of organisation and co-operation have helped to stabilise the condition of prosperity which dates from the war period.

In many ways the War served to draw rural Wales out of its isolation. Thousands of land workers who had served in foreign countries returned home with a new and broader outlook. The rapid development of road transport obliterated the formerly sharp distinction between town and country. Village institutes, women's institutes, tutorial classes, lecture courses and dramatic and musical societies are now firmly established in the rural areas. The social and intellectual advantages of urban life appear relatively much less conspicuous than they did formerly. The latest census returns suggest that rural depopulation is abating. Of the eight counties of England and Wales which showed a decrease in population in the inter-censal period (1911-21), two only were Welsh counties.

*Industrial Wales.*—Widespread industrial unrest, marked by frequent and protracted conflicts, characterised the years 1911-4. One fruitful source of trouble among the coal miners, namely, the remuneration for work done in "abnormal places," leading to the demand for a minimum wage, was removed by the passing of the Coalminers' Minimum Wage Act Nov. 27 1912. Trade depression was fairly general; there was much unemployment in the anthracite coal area, while the cost of living advanced steadily. The War induced a great outburst of activity and consequent prosperity in the coal-mining and metallurgical industries of South Wales. On the other hand the slate-quarrying industry in North Wales, which in 1911 gave employment to 12,800 men, was paralysed by the cessation of building operations. Hundreds of the workers migrated to the more favoured mining areas. Industrial peace was, however, of short duration, and by 1917 the position in the coal-field had become critical (see COAL). During and since the War the anthracite coal area in West Wales was greatly developed.

The slate quarrying industry in North Wales has recovered a considerable degree of prosperity through the general resumption of building operations and the industrial development of Snowdonia is proceeding steadily. Some of the industries started or greatly stimulated in Wales in the War period have become definitely established, notably oil refining in Swansea and various metallurgical industries in North East Wales (Flintshire). Copper smelting, which formerly ranked as one of the chief industries of South Wales, is decaying somewhat. In the period 1911-21 the most rapid increase of population occurred in the three Welsh counties, Flintshire, Monmouthshire and Glamorganshire. A satisfactory and lasting settlement of the coal question would almost certainly open a new era of industrial expansion and growing prosperity and progress in Wales.

*Conclusion.*—Whether or not the Welsh language and the traditions of native culture, which have withstood, with remarkable tenacity, successive processes of Romanisation, Normanisation and Anglicisation, will maintain themselves despite the advance of cosmopolitan industrialism, is becoming a question of deep interest and concern in Wales. It is, however, highly significant that the most vigorous manifestations of the vitality of native elements are, at present, found in the populous industrial areas.

*BIBLIOGRAPHY.*—E. L. Dobbins, *South Wales as the Chief Industrial Centre of the United Kingdom* (1922); Sir J. Rhys and Sir D. B. Jones, *The Welsh People* (1923); N. Edwards, *The Industrial Revolution in South Wales* (1924); Sir O. M. Edwards, *Wales* (1925). (E. E. H.\*)

**WALES, UNIVERSITY OF** (see 27.775).—A royal commission was appointed, in 1916, to enquire into the organisation of university and post-secondary education in Wales. In 1920, a supplemental charter, embodying, with certain exceptions, the recommendations of the royal commission, was granted. This added a fourth constituent college, University College, Swansea, to the university. The original three colleges are the University College of Wales, Aberystwyth; the University College of North Wales (Bangor); and the University College of South Wales and Monmouthshire (Cardiff). The university is now in receipt of the produce of a penny rate from each of the county and county borough councils in Wales and Monmouthshire, amounting, in the year 1924-5, to £54,498 7s. 10d.

The charter reconstituted and enlarged the university court as the supreme governing and legislative body of the university, and established as an executive body the university council. In both these bodies, the majority of the members are elected by the county and county borough councils of Wales and Monmouthshire. The university senate was replaced by a smaller elective body, the academic board. A larger measure of autonomy in academic matters was given to the colleges. By the new charter a board of Celtic studies, an extension board, a council of music, a Press board, and an appointments board were constituted by the authorities.

*New Chairs and Buildings.*—The University College of Wales, Aberystwyth, has, since 1910, established a chair of Welsh

literature, a chair of Colonial history, the Wilson chair of international politics, and a chair of music. The University College of North Wales established a chair of Welsh literature. In the Welsh National School of Medicine, at Cardiff, full-time professors of medicine and surgery and a part-time professor of obstetrics and gynaecology have been appointed. A tuberculous diseases diploma open to registered medical practitioners, has been instituted. The chairs founded at Swansea are classics, English, Welsh, modern languages, philosophy, education, mathematics, physics, chemistry, metallurgy and engineering. A faculty of technology has been established in the university, and the Cardiff Technical College, provided by the corporation of Cardiff, has been recognised as a technological institution.

The college at Bangor has completed its arts and administrative buildings. Its science buildings, now (1926) in the course of erection, are being provided by public subscriptions as the North Wales war memorial. The college at Aberystwyth has erected a college hall with accommodation for 2,500 persons, and the old students of the college have provided buildings for a college union. The permanent physical and chemical laboratories of the University College at Cardiff are (1926) in process of erection. Of the buildings given to the Welsh National School of Medicine by Sir William J. Thomas, the institute of physiology was completed and the department of public health well advanced in 1926. The University College of Swansea commenced in 1920, buildings on the site in Singleton Park given by the Swansea corporation. New buildings for the science departments and for some of the arts departments have been erected. The extramural work of the university has grown steadily during the last four years, and in the session 1924-5, 75 university tutorial and 31 preparatory classes were held, with a total enrolment of 2,389 students.

The majority of the county councils and county borough councils in Wales and Monmouthshire have agreed to contribute the produce of one-eighth of a penny rate in aid of the Welsh National School of Medicine, in addition to the penny rate contributed for general purposes. This contribution, added to subscriptions guaranteed for five years and donations, brings in an income of over £7,500 per annum for the school of medicine.

**Benefactions.**—Among the most important benefactions received since 1910 are the following:—

(a) An anonymous gift of £100,000 to the University College of Wales, Aberystwyth, for the endowment of chairs of international politics, Colonial history, geography, Welsh literature, music and for a directorship of extramural studies, as well as for other objects.

(b) A gift of £37,500, from Miss E. C. Talbot for the endowment of a Mansel-Talbot chair of preventive medicine in the Welsh National School of Medicine.

(c) A gift of £50,000 from Mr. Daniel Radcliffe for the benefit of the university.

(d) A gift, estimated at a total value of £90,000, from the corporation of Swansea in respect of the provision of land, buildings and equipment for the University College of Swansea.

(e) A gift of £10,000 from the Misses Davies, Llandinam, to the national council of music for the endowment of a university directorship of music for Wales.

(f) A grant of £14,000 from the Rockefeller fund trustees in aid of the medical unit of the Welsh national school of medicine.

(g) An anonymous gift of £10,000 for the purpose of enabling postgraduate students to prosecute research.

(h) A gift of £25,000 from Mr. David Davies and the Misses Davies, Llandinam, for the endowment of a David Davies professorship of tuberculosis.

(i) A bequest by Mr. Lloyd Roberts to the University College of North Wales, Bangor, of the capital value of about £34,000.

(j) A gift of £10,000 from Sir Thomas D. Owen for the establishment of a department of hydroelectricity at the University College of North Wales, Bangor.

**Numbers of Students.**—The numbers of students in the colleges have greatly increased since the World War. The highest numbers were reached in the year 1920-1, when the full-time students reached 2,926, including the ex-service men who received special grants from the Government. The numbers of full-time students in residence since 1920-1 are as follows: 1921-2, 2,850; 1922-3, 2,606; 1923-4, 2,663; 1924-5, 2,643.

**WALLACE, ALFRED RUSSEL** (1823-1913), British biologist (see 28.275), died at Broadstone, Dorset, Nov. 7 1913. In 1908

he received the O.M. Among his latest publications were *The World and Life* (1910) and *Social Environment and Moral Progress* (1912).

**WALLACE, SIR DONALD MACKENZIE** (1841-1919), British author and journalist, was born Nov. 11 1841. He was educated at the Universities of Glasgow, Edinburgh, Berlin and Heidelberg and at the Ecole de Droit, Paris. When 28 years of age he was invited by a friend to visit Russia, and became so much interested that he remained there for six years. His *Russia* (1877) had a great success, and was at once recognised as a classic. Shortly after its appearance Mackenzie Wallace became correspondent of *The Times* in St. Petersburg (Leningrad); in 1878 he was moved in a similar capacity to Berlin, thence to Constantinople, and after the battle of Tell-el-Kebir (1882) to Egypt. From 1884-9 he was in India as private secretary to the Viceroy, Lord Dufferin, and to his successor, Lord Lansdowne. From 1891-9 he was director of the foreign department of *The Times*. In 1899 he undertook the editorship of the New Volumes (issued in 1902 as the 10th edition) of *The Encyclopaedia Britannica*, but only remained on this work a few months. He had been created K.C.I.E. in 1887, and was made K.C.V.O. in 1901. In addition to his book on Russia he published *Egypt and the Egyptian Question* (1883) and *The Web of Empire* (1902). Sir Donald, who was a remarkable linguist, speaking some 20 languages, died at Lymington, Hants, Jan. 10 1919.

**WALLACH, OTTO** (1847- ), German chemist, was born at Königsberg. He studied in Göttingen, was made extraordinary professor in Bonn, and in 1889 became ordinary professor in Göttingen, retiring in 1915. In 1910 he was awarded the Nobel Prize for chemistry. In Göttingen he directed the chemical Institute of the university, was also a member of the Royal Society of Science in Göttingen and corresponding member of the Prussian Academy of Science. His researches were mainly concerned with the essential oils and the terpenes. With Tiemann and Semmler he was one of the scientific founders of the German synthetic perfume industry, which owes much to him. An appreciation of his life's work is contained in the *Wallach Festschrift* of the University of Göttingen (1909).

**WALLENBERG, KNUT AGATHON** (1853- ), Swedish banker, the eldest son of A. O. Wallenberg, the founder of the Stockholm Enskilda Bank, served as an officer in the Swedish Navy from 1874 to 1881. In 1874 he became a member of the board of directors of the Stockholm Enskilda Bank, was its managing director from 1886 to 1911, chairman of the board from 1911 to 1914 and again from 1917. Wallenberg exercised a great influence on industrial and economic development in Sweden; in conjunction with the *Crédit Lyonnais* he introduced Swedish state bonds on the French financial market in 1890, and co-operated in the floating of several Swedish state loans. He was a member of the board of directors of the Banque du Maroc from 1917 to 1920 and was succeeded therein by his brother Marcus. Wallenberg took part in the establishment of the Banque des Pays du Nord in 1911 in Paris, and of the British Bank of Northern Commerce in 1912 in London, which in July 1921 became Hambro's Bank. He was a member of the First Chamber of the Swedish Parliament from 1906 to 1919, and chairman of the Swedish chamber of commerce from 1912 to 1914 and again from 1918. In the Hammarskjöld ministry he was Foreign Minister from 1914 to 1917 (see SWEDEN). In 1918 he and his wife gave about 25 million krone to a fund for religious, social, scientific and educational purposes and for the encouragement of trade and industry.

**WALLENBERG, MARCUS** (1864- ), Swedish financier, brother of K. A. Wallenberg, began his career as a naval officer, and then studied and practised law. He afterwards became a member of the managerial board of the Stockholm Enskilda Bank, being appointed managing director in 1911 and vice-chairman in 1920. He founded, or reorganised, a number of industrial undertakings in Sweden, and also, in 1905, the Norsk Hydro-elektrisk Kvaelfstof Aktieselskab in Norway, and was one of the founders of the Central Bank for Norway and of the Swedish Industrial Union. In 1916 and 1917, and in 1917-8,

he took part in the negotiations with the Allied Powers concerning trading matters. He became a member of the neutral Powers' economic section of the Supreme Economic Council at Paris in 1919, took part in the Amsterdam meeting in 1919, and was Swedish representative at the Brussels Economic Conference in 1920. He was the finance delegate at the Genoa Conference in 1922, became a member of the Finance Committee of the League of Nations in 1924, and also chairman of the committee for arranging the tax on German industry under the Dawes Plan.

**WALLER, LEWIS** (1860-1915), British actor (see 28.283), died at Nottingham Nov. 1 1915.

**WALSH, WILLIAM JOHN** (1841-1921), Roman Catholic divine, was born in Dublin Jan. 30 1841. Educated in Dublin and at St. Patrick's College, Maynooth, in 1867 he was appointed professor of dogmatic and moral theology at Maynooth. In 1878 he became vice-president of the college and in 1881 succeeded Dr. Russell as president. Dr. Walsh took a keen interest in politics and served on several committees and commissions. He was partly responsible for the appointment of the commission to enquire into the working of the Queen's Colleges, and he became a member of the senate of the university (see 14.754). In 1885 he was summoned to Rome by the Pope and appointed archbishop of Dublin. This office he continued to hold till his death in Dublin, April 9 1921. Dr. Walsh's activities extended far beyond his official duties. In 1891 he became a commissioner for education in Ireland and, in 1908 a member of the Dublin statutory commission which established the Catholic National University, Dr. Walsh being elected chancellor. In politics he was a Nationalist, but he strongly opposed compromise with the British Govt., and after the rebellion of 1916 he supported the extremists, making no secret of the fact that in the election of Dec. 1918 he voted for a Sinn Féin candidate.

Dr. Walsh's published works include *A Plain Exposition of the Irish Land Act of 1881* (1881); *The Queen's Colleges and the Royal University of Ireland* (1883-4); *The Irish University Question* (1890).

**WALTER, BRUNO** (1876- ), German conductor of opera, was born in Berlin Sept. 15 1876. Walter, whose real name was Schlesinger, received his training in Berlin at the Sternsche Konservatorium. He studied under Ehrlich, Buszler and Robert Radecke, and first appeared as conductor of opera at the Municipal Theatre in Cologne. He then filled the same position in Hamburg, Breslau, Pressburg (Bratislava) and Riga. He went afterwards to the Royal Opera House in Berlin, which sphere of activity he exchanged in 1901 for the Court Opera in Vienna, where he conducted until 1912. On Jan. 1 1913 he became general musical director at the Munich court opera in succession to Mottls. On Oct. 1 1922 he retired from that position, and later became general musical director of the Municipal Opera in Berlin. Walter wrote three symphonies, a string quartette and other musical pieces.

**WANAMAKER, JOHN** (1838-1922), American merchant (see 28.302), died in Philadelphia Dec. 12 1922.

**WAR** (see 28.305).—The years 1914-8 have dug so deep a trench across the history of civilisation that the epithet "pre-War" implies a remoteness not to be measured in time. Nothing has suffered more from this ageing process than military literature. The old principles may hold good, but Napoleonic, American, Franco-Prussian and Manchurian illustrations are already obsolete.

The very word "war" has acquired a new significance. "War is the armed conflict of states, in which each seeks to impose its will upon the other by force"—so we have always been told. Today, aided by the revolutions which have rummaged the archives of foreign offices and court-martialled generals, we can go farther. We can perceive for the first time clearly the figures of ambassadors and general staff chiefs. In Işvolski's letters we hear strange echoes of our own "military conversations." Behind the smooth-spoken diplomats the soldiers manoeuvre. The common citizen is, in fact, at last able to get inside the skin of that mysterious entity, the State, which, like Father Saturn, has an ingrained habit of devouring its own children. "I am the State," said the

King of France. "The State is Power," said Treitschke. "The State is Finance," said Napoleon. "The State is a mutual benevolence combine," said Kant. "The State is Reason in action," said Hegel. Actually, in its relation to war, the State has now been proved to be the state of mind of Europe, inflamed by its own ministers, periodically craving for adventure.

## I. MANKIND AND THE MACHINE

To one who was in Hungary, Turkey and the Balkan States in 1908, and who, between that date and 1914, witnessed manoeuvres in Austria, Germany, Russia and England, it seems certain that already in those days the young men felt war keeping step with them in their ranks. Then, suddenly, some barbarian threw a bomb. The governments, who had for years kept their taxpayers blind to their own errors by saying, "an enemy hath done this," completely lost their heads and, before they knew where they were, the drums were beating and millions were on the march towards the hour of zero. From 1906 onwards the face of the clock wore its everyday expression, but beneath its smooth surface the alarm was set to "The Day," and emperors, parliaments and reason could only sit outside, watching the rhythmic beat of the pendulum.

Because good Europeans hate war in 1926 it does not follow that they hated war in 1914 or that they will hate it in 1964. Because Sir Bedivere has flung Excalibur far out into the mere let no one imagine that the glamour of the sword is forever quenched. Against that spiritual symbol the shield of Locarno, welded by the spectre of the falling franc, will form a poor protection. Today pacifists speak to the converted, but their young sons have been born with the old instincts. Those who have seen with their own eyes and suffered in their own bodies know the ugly truths of war, but they cannot convey their knowledge to the young generation. The old lack imagination to tell; the young lack imagination to believe. Nothing will stop war save a Second Advent of Christ. The year 1926 finds war in the melting pot where it is much more likely to take on a new shape than to corporate. Great Britain and the United States should use this respite to overhaul their machinery. Let neither of those great, but strangely improvident, nations imagine that because they mean to do the right thing by humanity they will on that account escape the challenge of the sword. Does not Hegel tell us that tragedy is the conflict, not of Right and Wrong, but of Right and Right? Was it wrong for Russia to want one small ice-free port for all her swarming millions? Was it wrong for Japan to think of her own swarming millions and to object? Was it not right of the Southern States to struggle for self-determination? Was it not right of the Northern States to say No? Two good ideas came into collision and bang went the cannon. Suppose even that the League of Nations was as supreme in the regions of morality as was once the Pope, could it put a hook in the nose of a leviathan like Russia?

*Mobilisation and the "Nation in Arms"*.—The first glimpses we get of humanity show war, tiger-like, springing out of the primeval forest and forcing man to realise loyalty, camaraderie and self-sacrifice. Since then war has clung as close to man as his own shadow, until, incredible as it may one day seem, by 1870 the civilisation of European nations had come to be measured, not by their arts, learning or religion, but by their wealth, by the numbers of their trained fighters and by their equipment. Before 1870 the methods of projecting the trained fighters into action and maintaining their numbers were secondary; after 1870 they became primary. One of these methods was "mobilisation"—the science of rendering an army capable of movement; the other was the "nation in arms."

All over Europe mobilisation schemes were worked up to the highest degree because a flying start meant that the earlier battles would lie beyond the home frontier. To begin mobilisation 24 hours sooner than the enemy was so much gained in time and space. As mobilisation itself sheds no blood the logical implication of this has escaped notice. But seeing that once started it cannot be stopped, that it substitutes action for negotiation, and that it forces threatened nations to follow suit, wholesale mobili-

sation is, in effect, war. Historians in search of a scapegoat on whom to discharge the sins of Europe may spare themselves the trouble of sifting impalpable intentions. The culprit is that Government which first gave the order for a complete mobilisation.

The doctrine of the "nation in arms" was first made completely possible by railways. Its idea is that the State has a lien on all men of military age; that the State should earmark those wanted for war, and that the rest should carry on "business as usual." But, since the World War, the brains of the suave Attilas who, in bowler hats and kid gloves, perambulate our modern cities, have hatched out a new thought. The "nation in arms" is to become the "nation at war." Next time the whole tribe are to go, literally, under fire. Next time all the life, all the machinery, fuel, food, wealth, transport of the State are to be drawn into the net and developed for purposes of destruction. This is the fixed goal of military intention, but it may be that the process will be reversed. Instead of the "nation in arms" being further expanded into the "nation at war," it may be that we shall have to revert to small, highly technicalised armies. For, in the view of the present writer, the combination of mobility, fire-power and protection against bullet and poison gas, which the internal combustion engine has given to aeroplanes, tanks and mechanical supply and transport units, will render our existing types of fleets and marching troops—horse, foot and artillery—as helpless as were the peasants of the *Jacquerie* when they encountered knights in impenetrable armour moving rapidly on horseback.

*Mechanical Warfare.*—Supposing the other nations of the world refuse to rise to the spiritual heights which would foreshadow a Second Advent, the English-speaking peoples should welcome at least the advent of the internal combustion engine. For the rifle, bomb and bayonet are as cheap and easy to obtain as the bow and arrow and they are more simple to handle. The war value of the Asiatics, the semi-Asiatics of Russia and of the Africans will, for generations to come, lie in mass tactics and the horde. The war values of northern Europe and America lie in the individuality of the fighter. These are biological characteristics. Unless civilisation can speedily equip itself with more complicated and brainy weapons than rifles, bombs and bayonets the hordes may overwhelm the individuals. It will be another story if we can shift the implements of force from rifles and bayonets to aircraft, submarines and tanks. The British Empire and the United States can manufacture war engines on the grand scale; they are alive with young leaders of initiative and action; the men of the North have a genius for handling and tending machines. In these respects Asiatics lag behind, and Africans are nowhere. The leading Asiatic nation, for instance, possesses daring pilots, but cannot, on the large scale, keep delicate machines in trim. Therefore, it behoves every nation that has the will to live to put its military house in order forthwith, and the British, especially, should at least put off their general strikes until they have evolved a super-chief of the General Staff.

## II. LORD KITCHENER

Never, in the history of the art of war, has the world been treated to so much war and so little art as in the conduct of the World War. One reason was the lack of artists. An artist with a pen uses as few words as possible, an artist with a pencil as few lines, an artist with a sword as few lives. But would even a Marlborough, who had so biting an experience of the infirmities of councils, have struggled against a French Plan XVII, a British Cabinet, and a British War Office from which the brain had been removed? By their very first move the Government, aided by Lord Northcliffe, had set aside the Army Council and reverted, to the methods of the days of Queen Anne. Be it remembered we are discussing the conduct of modern war in its technical aspect, and the last great example is still very close to us. An encyclopaedia is supposed to supply information; but in this case knowledge is so incomplete and space so limited that the only way to convey to the student a true impression of the conduct of the war of 1914-8 is to use famous names and familiar events, disclosing—though it be for the first time—some of the truth which underlay their outward and piously recorded actions.

*An Intense Individualist.*—The British Govt., yielding to an impulse, mainly emotional, pulled Lord Kitchener off his ship to conduct the war. The appointment gave confidence to the whole Empire, as well as to Lord Kitchener's old comrades in arms who remembered his flashes of instinct, his stonewall fortitude, his driving power, his industry—all his many just claims to be a superman. But the nation and many soldiers did not realise how intensely individualistic Lord Kitchener had remained. His mind entirely rejected the sweeping changes which took place in the British War Office and command headquarters in 1904. He knew the British Army as a finished article sent out for him to use. Railway transport, "intelligence," military hygiene, any sort of "deal" or "wangle"—leather for the men's shoes, silver for their medals, cigarettes for their canteens—interested him. The strategy and tactics used in outwitting individuals fascinated him, but strategy and tactics in their continental aspect were to him as a book that has been deliberately left upon the shelf. On his way home from the Manchurian campaign in March 1905, the British officer who had been attached to the Japanese Army was ordered to break journey at Calcutta, so that the Govt. of India might learn the latest developments of war at first hand. But once Lord Kitchener had realised that there was no blue china in Feng-hwang-cheng he lost interest in the subject: it was Lord Curzon who wished to hear about the 11 in. howitzers, the barbed wire and the trench mortars.

Much of the modern technique of his own profession was positively distasteful to Lord Kitchener. Up to the time when he left the Army in 1909, these marked idiosyncrasies were shielded from general knowledge by the small bodyguard of loyal and competent officers who had in his campaigns surrounded their hero. Some have said that in 1914 he was no longer the man of Omdurman and Pretoria. That may be so, but not in the sense that Earl Kitchener was less than "K." On the contrary he had become more so. There had been no weakening in his character, but some of his characteristics—his impatience, his lack of confidence in others, his secretiveness, his determination to keep certain things (troops, munitions, information) entirely in his own hands—had actually grown upon him. Through 10 years' exercise of unlimited power these characteristics had made headway and he, Kitchener, had quietly determined to conduct and win the World War, not by rule, but by his own rule of thumb. Also, let it be said at once, had he been able still to wield his unlimited power, he might still have played the magician. But he had lost his magic ring of devoted and intimate experts who were trained soldiers, who understood him and understood also exactly how far they might venture to go in keeping him in touch with both the Press and with his orthodox advisers.

*The War Office in 1914.*—Just at the moment when Kitchener first entered the war office it had become, in theory, the Imperial power house. In theory every officer, clerk, typist was standing by as in a man-of-war steaming into action. Actually the apparatus had been dismantled. The chief of the general staff, the adjutant-general and the director of military operations had only been put in a month or two previously. The first of these had never, either in peace or war, practised the general staff side of soldiering, or shown any taste for it. He had been appointed because he was a sound administrator of regulations and because, being at the same time inflexible and just, he was rightly believed to be the best officer to restore the spirit of discipline so seriously shaken by the Curragh revolt. As it was obvious that, even for the seven weeks' war then anticipated, he would need coaching, he was to retain the services of an officer whose reputation and experience would greatly have strengthened his hands. This subordinate was Sir William Robertson, whose commissioned service had been passed on the general staff. But, to the amazement of himself and of the Army, on mobilisation he was sent to assume duties he had never before practised as Quartermaster-General in France. His gay escape from the war office was at once a catastrophe and a portent. The general staff work of the high direction was to be handed over to personages who, whatever their value in other branches of the conduct of war, were profoundly ignorant of the principles and technique of policy, strategy and tactics.

*Kitchener's Idea.*—Lord Kitchener might have recalled a born chief of the general staff, Sir Douglas Haig. He did not do so for exactly the reason which induced him to let Robertson go. A strong chief of the general staff was to him, not a support, but a rival. A chief of the general staff who would have taken his proper place in the war councils of the nation must have spoiled his plan. He meant to run this great war by himself, just as he used to run the South African War from Pretoria. But here, at the last lap of the course, destiny, his old friend, failed him. His very first move miscarried. Before Sir John French left England he had to receive formal instructions. Whether Kitchener wrote them or not he signed them. In some respects they are unlike Kitchener, being reminiscent rather of the "hedging" instructions issued by Kuropatkin to Stackelberg. For instance: "the gravest consideration" (*sic*) "will devolve upon you as to participation in forward movements . . . where your Force may be unduly exposed to attack"; but then he knew that French was apt to be over-confident at the outset. Another sentence, however, surely betrays its author: "I wish you distinctly to understand that your command is an entirely independent one, and that you will in no case come in any sense under the orders of any Allied general." Upon this emphatic paragraph Kitchener meant to base his own personal, if intermittent, conduct of the British operations; these in their turn would lead, during the long war which he almost alone foresaw, to the command of the whole of the Allied Forces.

Had not these projects been nipped in the bud, at least the conduct of the War would have been more original. The man who conceived and carried out the gigantic idea of planting down all the barbed wire in the world on to the South African sub-continent would have done something out of the common. Lord Grey of Faloden says in the chapter of his book which treats of strategy, that "when the opposing armies had dug themselves in from Switzerland to the sea, no one was more perplexed than Kitchener." Naturally. It has always been a mystery how Kitchener passed into Woolwich, but he could deal with the fact when he bumped up against it. As early as Sept. 1914 he said, "I am only an engineer but the Kaiser would have been out of the Aisne by now had I been there to shove them all along." And it was so!

*French v. Kitchener.*—When French was continuing his retreat to the southwards of Ham with a speed which, from that point onwards, had become unnecessary, the Prime Minister, in response to appeals from our Allies, begged his new Secretary of State for War to go over to France and explain personally to the commander in the field that the independence given him in his instructions was not meant to cover the withdrawal of his forces from the line of battle. Kitchener would rather have waited a little longer, but the pressure was great and he consented.

He went in uniform and alone. Had he taken two Army Councillors with him, a secretary and a flag, he might have done anything and worn uniform or not as he pleased. As it was, he had no one to keep him right on what seemed a mere point of etiquette, though really it went to the root of his aspirations. His dress implied openly that he was prepared to give executive orders. He knew Sir John French intimately. He knew that the main fault of that fine commander was an undue optimism, balanced at the other end of the spectrum by undue pessimism. He knew that, popular as French might be, he himself stood, imaginatively, on another plane. He knew that the ardour which the mere sight of himself in uniform would create must double the fighting value of the Expeditionary Force. He knew also that his power over human beings was latent; that it could not be communicated by word or letter; that it depended upon the weight of his personality on the spot and in action. That is where the Kitchener books go astray. They give little samples of the sort of things he could not do: the Magician escapes them. Colonel House is the only one who "gets there" and yet even Colonel House does not see how, on his own showing, Kitchener at their interview outwitted him." But although Kitchener was

<sup>1</sup> Colonel House, on his interview with Lord Kitchener, May 12 1915: "I was impressed by his fairness and the impartial way he discussed our possible entry into the War. While it was the clever way to talk to me, he did not do it for that reason, for how could he

prepared for French, he had not reckoned upon an ambassador. He was encountered not only by his old subordinate in the field—now no longer subordinate—but also by the threat of an appeal to the Foreign Office, a department for which his respect was childlike. He was technically out of court in his uniform, and so, like a tiger which has missed its spring, he came growling home. His whole method of handing over the tactics of an enterprise to a subordinate and of then, at any crisis, suddenly applying his formidable personality and urging everyone to unheard-of efforts was shattered—once and for all.

French had defeated Kitchener and more than Kitchener. He had been hustled by him for a couple of years in South Africa, not to his disadvantage. But here was his chance to throw off the old yoke and so, with Sir Francis Bertie's help, the battle of the Marne was delayed. General Joffre's orders for the battle of the Marne were written on Sept. 4 and it is stated in the book "1914" by Lord French that "on this night (Sept. 4) I ordered the British Forces to retreat a few miles further South." No one can say whether to fight the battle of the Marne earlier would have been an advantage or the reverse—what can be said is that with Kitchener himself in the field, the troops would have been inspired to make the supreme effort of their lives, both in the attack and in the subsequent pursuit.

### III. BRITISH CONDUCT OF THE WORLD WAR

*Lack of a General Staff Doctrine.*—The British Empire, then, went to war without a general staff to advise Cabinet, Committee of Imperial Defence or War Office. Lord Kitchener—a soldier who never, to the day of his death, was able to appreciate the idea of a general staff, which he regarded as a subtle device to suppress commanders-in-chief,—Lord Kitchener shouldered everything. For some 18 months the higher direction carried on without having any clear notion of the direction in which the main stream of their efforts should flow. Working in the dark, distracted by differences of opinion, the conduct of war became so spasmodic, so erratic that, by the time Sir Archibald Murray and Sir William Robertson had at last brought home to the Cabinet the meaning of the words "general staff" it had become rooted in its evil ways. Students will best realise the cause of the confusion and lack of consistency in British Councils by reading the remarkable letter Sir William Robertson wrote to Lord Kitchener in Dec. 1915, when the post of the Chief of the Imperial General Staff had been offered to him.<sup>2</sup> So succinctly, so clearly did it lay down the relations which should exist between the war council of a democracy and the chief of a general staff that, considering by whom and to whom it was written, it is bound to become a classic.

Yet, upon the immediate conduct of war, it made but a fleeting impression. For the wisdom seemed to melt out of the words under the glitter of the rising star of Mr. Lloyd George, of whom M. Clemenceau is reputed to have said that "he fancied himself the first Napoleon." Perhaps, but he was no soldier. So small a difference and yet one which turned all the other resemblances into caricatures! Napoleon thought he could dispense with a general staff. So did Mr. Lloyd George. He was not going to have his hands tied by any general staff doctrine. He told Colonel House "he had found soldiers self-opinionated and unsatisfactory," and he clung to that opinion until he met at last a soldier whose views coincided with his own; for what he wanted was a Berthier to valet his genius and dress it up in khaki, a situation accurately gauged by the most acute personality in the Army, General Sir Henry Wilson. As things turned out, the letter of Sir William Robertson—bravely written and bravely taken—remained a dead letter until Foch did, at the end, what Kitchener, under happier auspices, might have done at the beginning.

Students may find it useful to take a few cases in which the British higher direction betrayed its lack of general staff doctrine, and then to go on to reflect that in hundreds of smaller issues, from day to day and hour to hour, similar incoherences were

know what would or would not influence me?" The last dozen words are funny. Did no one warn Colonel House that he was about to put himself *en rapport* with a man who, clumsy as he might seem, was uncanny in his thought-reading powers?

<sup>2</sup> Sir W. R. Robertson, *From Private to Field Marshal*, p. 239.

taking place: (1) The Territorial associations, the only organisation for expansion, discarded. (2) The main force on the Western Front and its out-flanking detachment at the Dardanelles, handled, in regard to dates of battles, transfers of picked troops, howitzers, aeroplanes and high explosives as if there were no sea, no ships, no interchangeability—as if, in fact, the two sets of operations were separate wars in water-tight compartments. (3) Four raw divisions launched direct from home billets into the midst of a great battle at the Dardanelles when very ordinary common-sense would have sent them to relieve war-seasoned divisions in French trenches who would at once have grasped the situation at Suvla Bay. (4) The British entry into the eel-trap of Salonika, constructed by the French Cabinet and General Joffre for political purposes and generals. (5) The Admiralty torn in two by the struggle between Mr. Churchill and Lord Fisher—between the Black Sea and the Baltic. Once the student has weighed these questions for himself he will understand that the most serious flaw in the British equipment for the struggles of 1914 and 1915 was not the lack of big guns but of a chief of the Imperial General Staff armed with a doctrine and strong enough to catch hold of brilliant amateurs like Mr. Winston Churchill and others and wheel them into line before they approached the Prime Minister; strong enough also to support the Cabinet against the combined pressure of the French Govt. and the G.H.Q. of their own Expeditionary Force.

Had Mr. Asquith been 20 years younger he might have straightened out the tangle. As it was he took off his hat first to Lord Kitchener and next to Mr. Winston Churchill. When they differed he compromised. Clever compromise may keep cabinets together; war is uncompromising. The British Empire began its conduct of the war with the Cabinet of Aug. 5 1914. The exact emergency for which the Six Divisions had been prepared had arisen and 20 civilians, soldiers and sailors were asked what should be done with them! The War, thus begun, was carried on by a series of happy thoughts. This is the cold shade under which modern British soldiers have fought the World War to a finish. Armies, fleets and aircraft form only a part of the nation at war. Only one man can unite in his person, policy, finance and military action—that is the Prime Minister.

*The Higher Direction and Strategy.*—Strategy and tactics are to be dealt with in their technical aspects elsewhere; here they will only be indicated from the standpoint of the higher direction.

Experience shows that, within his own sphere, the commander should be left as free a hand as possible in bringing his strategy into line with state policy. If there is but one theatre of war the general should be left to solve the problem entirely in his own way, when, other things being equal, he will beat a general tied to the apron-strings of his Government. Roberts marched on Kabul from the Shutargurda Pass with only transport enough to move half his force on alternate days, putting time above strength. No higher direction would have shouldered the desperate risk of fighting the battle of Charasia with half an army against the whole of the Afghan regulars whilst the mountain tops were white with the watching tribesmen. Wolseley told his own Royal commander-in-chief, his own army and the British Press that he was about to march from Alexandria upon Cairo—then took ship for Ismailia! These were simple cases and it was well for the Empire that Lord Lytton gave Roberts a free hand and that Wolseley took a free hand for himself.

Somewhat less simple was the case of Buller, who was left to make up his own mind whether he should march northwards through the Orange River Colony or whether he should first relieve Ladysmith. More complicated still was the Manchurian problem, when Kuropatkin found the whole of his wise strategy bedevilled by the Tsar and by Admiral Alexeyev. Nothing was left for him but tactics and administration. Thereby Russia lost the War. The strategy of the Japanese navy and army was, on the other hand, given the completest independence which has ever, in modern history, been granted by prime minister, emperor or king to naval or military commanders. This was because in Prince Yamagata the Japanese had a defence minister whose rank, age and prestige secured his strategy from being at any

time hampered by state policy. As regards the conduct of the War, he was supreme, excepting in the region of finance. Fleet and army moved like one service. Great Britain never approached these most fortunate conditions.

*Political Control.*—But whenever there are several distinct theatres of war, then the higher direction is bound to do some directing and the autocrat or prime minister who can draw the delicate line between guidance and interference shows himself a master of his craft. In the years from 1862–4. Federals and Confederates had their “easterners” and “westerners.” Which of the two war theatres, Richmond or the Mississippi, held the true goal of victory? Till 1864 the Federal generals were uncontrolled from Washington, and Washington all but lost the war. Then that apt pupil, Abraham Lincoln, learned when to guide Grant and when to leave him alone, and the North won. In the South, Lee, left without political control or guidance, won so long as guidance was not needed. But when guidance was wanted and failed, not all his generalship could give victory to fools in the Cabinet.

At its outbreak, the World War presented a more simple and straightforward problem than any of the cases quoted. Plan XVII. was a cut-and-dried fixture. Had Joffre, on the first day of the war been replaced by his antithesis, Foch, Plan XVII. would have stood, though not for so long. The die was cast, in fact, and, if the strategy was unsound, it could only be retrieved by sound tactics and “human bullets.” State policy should have effaced itself and left the field entirely free for the naval and military commanders and their strategy. Yet, at the Cabinet of Aug. 5 1914, there was nothing to show that the opinion of Sir John French counted for any more, on a question of pure strategy, than that of civilian amateurs or soldiers about to be subordinate to him in the field. Eight months later the Dardanelles campaign was undertaken, and from that moment onwards the necessity for clear-cut, emphatic direction from Whitehall became vital. There was none. State policy was of two minds. The General Staff had ceased as a governing body to exist. Neither Kitchener nor the Prime Minister ever decided which was momentarily the main strategic current—eastwards or westwards. Not one word to the commander in the East of the political trend of affairs in Italy or the Balkans; not an effort to use the amphibious power of Great Britain to move troops, big guns and high explosives from one theatre to the other, a feat which the Central Powers could not have emulated in any way—not at least until Bulgaria came into the War (*vide the Memoirs of General von Falkenhayn*). Each year that followed brought in a new theatre of war and with each came a greater need for higher direction and, it must be added, for a British Yamagata or Abraham Lincoln.

What was the attitude of the higher direction on the “Kill Germans” strategy and tactics? In the absence of a general staff can anyone say? Even now it can only be surmised that the attrition system was supported by the Cabinet. Napoleon once said that the destruction of the main force of the enemy was the true war objective. But Napoleon’s maxims are like postage stamps; stick them on any opinion—it will get there! All through the War this axiom was trotted out to support a strategy which involved tactics culminating in the suicidal frontal attack. “The main force of the enemy” was the avowed objective during the Champagne offensive of 1915 where the flower of the British Empire was sacrificed for half their number of Germans. The French Cabinet and British G.H.Q. in France were at one in the violence of their opposition to any turning movement beyond the sacred boundaries of “la Patrie.” They were within bombing range of the Germans and, to them, the argument that “side-shows” were an avoidance of the “main force of the enemy” made personal appeal. But Jomini, who knew Napoleon so well, repudiates the notorious axiom. In the 8th edition of the *Encyclopædia Britannica* it is written:—

In war it has been laid down as a fundamental axiom by successive military writers, including Jomini and the Commandant of our own Staff College, Colonel MacDougall, that to obtain success in the shortest time the greatest force should be brought to bear, in the right direction, on the weakest or most impressive point of the enemy.

In so far as the line of battle on the Western Front had become static it gave no scope for strategy which, by its dynamic quality, is the natural antidote to dugouts and attrition. Strategy, in fact, had been elbowed off the mainland of Europe and only hung on at her skirts. The British higher direction, by leaving the conduct of the war to the French Cabinet and the British G.H.Q. in France, are responsible for Festubert and Loos—expenditures at the wrong time and place; expenditures wasting human energies and high explosives a small proportion of which, applied to a weakly covered flank by an amphibious power, must have been decisive.

#### IV. THE FUTURE OF WAR

Time and space have ever been the dominating factors of strategy: fleets and armies become daily more mobile: acceleration is in the air. But what is the good of all this to a pedestrian higher direction? The velocity of the motions of the mind of a cabinet can be gauged by the new conductor of strategy they have just created. A cabinet committee has hatched out a "Super-Chief of the general staff in commission" to advise the prime Minister. The three chiefs of staff to the three services are to meet under the chairman of the committee of Imperial defence and are to consider themselves a super-chief! But the general staffs of the three services and of the Dominions are human beings. "I can deal with a man, not with a committee," said Sir Douglas Haig to Lord Milner and so say the Commonwealth and Dominion services. Aircraft are challenging ships and railways. Palaces, Houses of Parliament, arsenals, power houses, banks may be put out of action within a very few hours of a declaration of war. The chiefs of the general staff of each service will be concentrated upon their own land, sea or air forces, with every fibre of their being, but the Super-Chief of the general staff in commission will have vanished—he will have resolved himself into his three elements—and with him will have gone the Prime Minister's right hand!

If the higher direction be well advised in leaving their commander as free a hand as possible in his strategy the same principles apply, even more strongly, to his tactics. For here we enter the domain of the commander, the artist, the only individual now left in war who stands outside of the preconceived and who, by his personal inspiration, may crumple up the best laid plans. He it is who has it in his power to spread confidence by merely looking confident or, by one brief inspection, to infect a gallant army with despair. He it is whose learning must have become instinctive, who must possess both moral and physical courage, who must enjoy fighting, and yet always seek for his victory in manoeuvre rather than in slaughter. The nation possessing a great commander has half the battle in hand every time. For war becomes a science only during peace. Numbers, armament, training, national characteristics can all be weighed and calculated in peace-time, but when "The Day" arrives the human will enters upon the scene and may stultify statistics. In 1908 the Adjutant General to the Forces spent his leave inspecting the mobilising troops of the Hungarians and the Balkan nations. He reported to the War Office that the Bulgarian infantry were second to none in Europe. The judgment proved itself sound in the campaign against Turkey. In the campaigns against the other Balkan States and the Allies the Bulgarians went to pieces. They deserved to be defeated; they felt this, and they were defeated. Owing to moral factors the Bulgarian Army lost 50% of its value.

*Military Strength and Policy.*—The higher direction cannot always pre-arrange moral factors, but it can see that its army does not lag behind in the material factors. In his book 1914 Lord French remarks, "I cannot help wondering why none of us realised what the most modern rifle, the machine gun, motor traction, the aeroplane and wireless telegraphy would bring about. It seems so simple when judged by actual results." This—the astonishment of an ex-chief of the Imperial general staff—is not quite fair to those who had at least urged that the War Office windfall (spent on extra cavalry horses) should be devoted to heavy artillery. History only repeats itself because lack of imagination repeats itself. If any personage of transcendental quality

could possibly spare time to concentrate for a fortnight upon the military problems of Greater Britain he would find that the defence forces of the Empire have been very busily spending the past four years in working up for another "I cannot help wondering why none of us realised." One of the first things a prime minister (for instance) would discover was that he had not carried out his part of the bargain laid down in the Field Service Regulations which say that the Government will at all times, at their discretion, keep the Chief of the Imperial General Staff informed as to the drift of their policy and that he, on his part, will prepare accordingly.

Unfortunately post-War Govts. have given no indication of the drift of their policy except that they are "drifting" towards the obligations of Locarno. Under Asquith, Haldane and Grey there was what is called a tacit understanding between the sailors, soldiers and politicians. Faced by so clear-cut an issue Territorial and Regular vied with one another in the race for efficiency and became what they were. Since the War there has been less cohesion and less enthusiasm, because men can never do their best when they feel instinctively that their chiefs do not know what they are driving at. The bulk of them are quite well enough educated to feel sure that the next European war will be decided in the clouds and yet they see their chiefs in the Navy and Army each struggling for the lion's share of the military budget. The phantom Super-Chief of the Imperial general staff in commission cannot judge between them, for he is a trinity holding, on that point, three diametrically opposed views. War may be a long way off but since this article began to be written it has drawn a little closer. Were it only for the sake of tactics there is crying need that the British get their military house in order, especially in its top storey. The rank and file and lower deck ratings are the most splendid stuff imaginable. The officers have war experience. The masses of trained fighters are still fit to take the field. But there is no head. Only the Prime Minister can be head in war, and he is not equipped for the task nor kept in practice during peace. He has neither a Defence Minister nor a living Super-Chief of the General Staff to take his ideas on policy and give him back a technical view of their bearings upon his defence force estimates.

*A Mechanicalised Army.*—Tactics being an art which is largely concerned with material and visible factors reflects the emptiness of the British military top storey most clearly. As soon as possible after the War it was the duty of the higher direction to evolve a new model army. That was the moment to cut down the man strength of the divisions and replace the lost fighting strength by machines. Instead of that the problem was shirked. Writing on the efficiency of the Army in Sept. 1925, Field Marshal Sir William Robertson, by no means a revolutionary or fanciful personage, says of the tank that it "has not yet been accorded the prominent place in our war preparations which it merits." The Field Service Regulations tell us, he goes on to observe,

That during the comparatively brief period which has elapsed since tanks were first used, their characteristics have changed materially; that further rapid changes and improvements will probably take place; and that until these experimental stages have been passed through a temporary organisation must necessarily be adopted.

But the War ended in 1918 and still there are only a handful of tanks tacked to the old 1914 divisions of Regulars and without any tanks at all for the Territorials! Roberts drove this "wait and see" heresy out of the Indian Army when, in 1882, he found that the Armstrong guns purchased ten years previously for the defence of the roadstead of Madras were still lying unmounted on the beach. He was told "further rapid changes and improvements will probably take place, etc., etc.," and so they did, for although the guns could not be fired, the responsible officer was discharged.

Seven solid years have been squandered, masses of money have been misspent, while Great Britain has been waiting, hoping to see some other nation create a new model army, of which every man, in virtue of his equipment, will be worth half a dozen of those British soldiers who took part in the autumn manoeuvres

of 1925. Then, presumably, the intention is to set to work and copy it. Does anyone really still imagine, after all that has been learnt about war, that this would be tolerated? From the time of the Armistice onwards one or two military enthusiasts have done what they could to press these views upon the British people. At last, the ideas of a mechanised army began to make headway until, at the royal banquet of 1924, there was a reply. "The rifle and bayonet," reaffirmed the responsible official, "are the infantryman's chief weapon. The battle can be won in the last resort only by means of these weapons." Two months later, at Bisleigh, returning to the charge, he told the marksmen there assembled that "mechanicalisation would help to get them to grips with the enemy, but once at grips the issue lay with the man and the rifle and bayonet would decide battles as they always had done." There stood the riflemen of England, worthy descendants of the archers of Agincourt. There stood the war leader, assuring them they were still lords of the battlefield. And yet—how if a single enemy tank had appeared upon those Bisleigh ranges?

Since then there have been manoeuvres in India and in England, at which, for the first time, a fringe of machines have been tacked on to the skirts of the main 1924 organisation. There were the armies, longing to be at one another and yet—no battles! The lessons drawn from these manoeuvres will fall under the heading of tactics. From the more general standpoint of war, suffice it to say that, few as were the machines, they so set the pace as to leave the old-fashioned troops out of it. Clearly, cavalry and infantry must not be too proud to take a hint from their civilian brothers who find that the motor 'bus gets them there and that the horse 'bus does not.

To write an article on war is easy; to read it at a time when universal lip-service is being paid to peace needs courage. Those who have come so far in company with the writer may be trusted, therefore, not to flinch from the reflection that the chemical warfare committee, as shown in the Army List, is not in any way relaxing its activities since the white dove, hatched out at Locarno, began to fly over the earth. This being so, one may be fairly sure that in no other country is there any slackening-off in these preparations by men to poison their fellow-men when the next "Day" comes along. The most convinced pacifist need not then scruple to carry his thoughts onward to the contemplation of a new model army, even although the idea has hitherto been persistently rejected by responsible authorities. For there is a tide in the affairs of men, and although admiralities let go every anchor they possess and war offices megaphone to their generals, "back to 1914," that tide will prove in the end too strong for their tackle.

An army must be built up round something. The fabrics of Greek Art and Roman Law rose from the foundation of the heavily armed hoplite and the steel-clad legionary. In 378 A.D. heavy cavalry swept these pillars of society out of military significance until 1314 A.D. After that came the day of infantry again first in conjunction with archers, afterwards as fighters of dual functions, the bullet and the bayonet their weapons. These survivals of Blenheim, Waterloo and Mons were, at least until a few months ago, the supreme arbiters of war in the eyes of British military authority. But let the student look up, for Victory is winged. Sea and land forces have become the servants of the air force. The navy will be represented more and more by fleets of seaplane carriers. The functions of armies will be to push on as fast as petrol can drive their machines to seize advanced bases and depots, whence ever more extended air raids can be delivered. The atom round which the British defence forces must be grouped is no longer a human being—it is an internal combustion engine. (See STRATEGY; TACTICS.) (I. H.)

**WARD, SIR ADOLPHUS WILLIAM** (1837–1924), British man of letters (see 28.319), died at Cambridge June 19 1924. He was knighted in 1913. His *Germany 1815–1890*, 2 vol. (1916–7) was a notable addition to his published works.

**WARD, JAMES** (1843–1925), British psychologist and metaphysician (see 28.320), published, after 1910, *The Realm of Ends, or Pluralism and Theism* (1911, 3rd. ed. 1920); *Heredity and Memory* (1913); *Psychological Principles* (1918, 2nd ed. 1920); *A Study of Kant* (1922). He died March 4 1925.

**WARD, SIR JOSEPH GEORGE** (1856– ), New Zealand politician, was born at Emerald Hill, Melbourne, April 26 1856, his father being a merchant. He was educated privately in Melbourne and at a state school at the Bluff, New Zealand, and at the age of 13 entered the Post and Telegraph Department. At 21 he became an export merchant, and in 1887, after nearly 10 years' experience of municipal politics, he entered Parliament as Liberal member for Awarua. Appointed treasurer in the Seddon Cabinet of 1893, he was the Prime Minister's chief lieutenant until Mr. Seddon died in 1906, and then succeeded to the Premiership and the leadership of the Liberal party. He had not the dominating personality or immense popularity of Mr. Seddon, but he showed practical administrative ability of a high order and pioneered several important reforms, such as loans to settlers, the All-Red cable service, and penny postage for New Zealand.

Sir Joseph was a staunch Imperialist, and unlike many of his contemporaries in the other Dominions, believed in subsidising the Imperial Navy rather than creating separate fleets. To this end he offered the Home Government a Dreadnought—or if the need arose, two—in 1909. His Ministry was defeated in Feb. 1912, but Sir Joseph Ward—he had been knighted in 1901 and was made a baronet after the Imperial Conference of 1911—returned to office as Minister of Finance in the National (War) Cabinet of 1915–9. In 1917–8 he was a member of the Imperial War Cabinet and in 1919 represented New Zealand at the Peace Conference. In 1919, after representing Awarua continuously since 1887, he lost his seat, and in 1923 he was defeated in a by-election for Tauranga. He then definitely retired from politics and devoted himself to business. (G. C. D.)

**WARD, LESTER FRANK** (1841–1913), American geologist and sociologist (see 28.320), died in Washington, D.C., April 18 1913. His numerous minor publications, together with biographical notes, were issued under the title, *Glimpses of the Cosmos*, 6 vol. (1913–8), the last five volumes posthumously. See Mrs. E. P. Cape, *Lester F. Ward*, a personal sketch (1922).

**WARD, MARY AUGUSTA** (1851–1920), British novelist known as Mrs. Humphry Ward (see 28.320), died in London March 24 1920. Since 1910 she had published *The Case of Richard Meynell* (1911), a study of Modernism and, in a sense, a sequel to *Robert Elsmere*; *The Mating of Lydia* (1913); *The Coryston Family* (1913); *Delia Blanchflower* (1915); *Eltham House* (1915); *A Great Success* (1916); *Lady Connie* (1916); *Missing* (1917); *The War and Elizabeth* (1918), and a posthumously published novel, *Harvest* (1920). She had also in 1918 published her memoirs, *A Writer's Recollections*, and publications connected with her War propaganda work were *England's Effort* (1916); *Towards the Goal* (1917); and *Fields of Victory* (1919). The Passmore Edwards Settlement, in Tavistock Place, London, was renamed after her the Mary Ward Settlement, this being a tribute to the great interest she had shown in its work. Her husband, Thomas Humphry Ward, long associated with *The Times*, died in May 1926.

**BIBLIOGRAPHY.**—Stephen L. Gwynn, *Mrs. Humphry Ward* (1917); J. Stuart Walters, *Mrs. Humphry Ward; her work and influence* (1922); Janet P. Trevelyan, *The Life of Mrs. Humphry Ward*, (1923).

**WARD, WILFRID PHILIP** (1856–1916), British man of letters, was born at Ware, Hertfordshire, Jan. 2 1856, the second son of William George Ward (see 28.321). Educated at St. Edmund's College, Ware, Ushaw College, Durham and the Gregorian University of Rome, he became lecturer in philosophy at Ushaw College in 1890, and examiner in mental and moral science to the Royal University of Ireland, 1891–2. In 1906 he became editor of *The Dublin Review*. He was the author of numerous books: *The Wish to Believe* (1884); *The Clothes of Religion* (1886); *W. G. Ward and the Oxford Movement* (1889); *W. G. Ward and the Catholic Revival* (1893); *Life and Times of Cardinal Wiseman* (1897); *Aubrey de Vere, a Memoir* (1904); *Life of John Henry Cardinal Newman* (1912) and several volumes of essays. He died in London April 8 1916. A biographical notice of him, written by his wife, Josephine Mary (b. 1864), was published as a preface to his *Last Lectures* (1918).

**WAR GRAVES.**—One of the most interesting pieces of organisation resulting from the World War is represented in the Imperial War Graves Commission, which was constituted on behalf of the governments and peoples of all parts of the British Empire, and charged with the care in perpetuity of the graves of their sailors and soldiers.

*Origin of the War Graves Commission.*—With a view to ensuring the permanence of the graves of British soldiers buried in France discussions took place early in the War between the British military authorities responsible for the marking and registration of the graves and the French Government. On Dec. 29 1915, the latter passed a law which provided that all Allied graveyards on the soil of France should be acquired by the Government of the Republic at its own expense, and that the rights of ownership should be enjoyed in perpetuity by the Allied nations concerned.<sup>1</sup> This practical tribute to the valour of the British armies was profound in its effect on the relations between the two Allies during the War. Under this law it was possible for an *association régulièrement constituée* by an Allied Govt. to be entrusted with the care of its graves in France. The result was the establishment in Great Britain (Jan. 1916) of a National Committee for the Care of Soldiers' Graves, the presidency of which was accepted by the Prince of Wales.

As the fighting extended it became evident that the care of the graves after the War and the erection of permanent memorials would be a task too extensive for a body with the limitations of the national committee to undertake. Among these limitations was the lack of direct representation of the Dominions and other parts of the Empire, whose soldiers were falling and being buried side by side with those of the United Kingdom. In a memorandum addressed to the Prime Minister, dated March 15 1917, the Prince of Wales, as president of the national committee, suggested that the formation of "a joint committee of the governments of the Empire, or a statutory body of commissioners somewhat on the lines of the Development Commission," should be proposed to the forthcoming Imperial Conference. The question was accordingly laid before the conference on April 13 1917, when a resolution was passed praying His Majesty to grant a royal charter for the constitution of an Imperial War Graves Commission, which should be empowered to care for and maintain the graves of those fallen in the War, to acquire land for the purpose of cemeteries and to erect permanent memorials in the cemeteries and elsewhere. The charter was passed under the great seal on May 21 1917, and the commission, of which the Prince of Wales became president, was established.

*Constitution of the Commission.*—The members of the commission are the Secretary of State for War (ex-officio chairman), the Secretary of State for the Colonies, the Secretary of State for India, the First Commissioner of Works and the representatives of Canada, Australia, New Zealand, South Africa and Newfoundland. The charter further provides for eight non-official members appointed from time to time by the Sovereign.

The commission's deliberations during their first year resulted in the double proposal laid before the next Imperial Conference on June 17 1918, that £10 per grave should be taken as the probable cost of the construction of cemeteries, and that the cost of carrying out the decisions of the commission should be borne by the respective governments in proportion to the numbers of the graves of their dead. It is hardly necessary to emphasise the significance of the adoption of this proposal; a precedent may thus have been established with far-reaching effects; at any rate a most interesting experiment in co-operative administration among the nations of the British Commonwealth had been initiated. It is based on the principle that each shall be financially responsible in proportion to the amount of service rendered on behalf of the whole. In this connection it is important to note that estimates are presented yearly in identical form to each of the participating governments, the respective Parliaments being asked to vote a proportion of the total in accordance with the

decision of the Imperial Conference of 1918 referred to above. The commission administers the grants in aid thus received through a finance committee, which meets regularly at short intervals and which is attended by a representative of the Treasury of the United Kingdom to advise and assist. The principle of complete co-operation runs through all the work of the commission, the participating governments being represented in the administrative personnel, both in London and abroad, on the same proportional basis as has been adopted for the sharing of expenditure.

*Policy.*—One of the first acts of the commission was to lay down as a guiding principle that the graves of all ranks should be treated on a basis of absolute equality. With this principle as a foundation, the commission invited Sir Frederick Kenyon, director of the British Museum, to report on the best method, in his opinion, of discharging their responsibilities.

Sir Frederick's recommendations, which were adopted by the commission, were briefly as follows: 1. The erection of uniform headstones over all War graves. 2. The erection of two central monuments in each cemetery where possible. 3. The collection of isolated graves into selected cemeteries.

Among the architects entrusted by the commission with the preparation of architectural designs were Sir Edwin Lutyens, Sir Reginald Blomfield, Mr. Herbert Baker, Sir Robert Lorimer and Sir John Burnet. The headstones are 2 ft. 8 in. in height, 1 ft. 3 in. in breadth, and 3 in. in thickness. Each stone as a rule bears at the top the badge of the regiment or unit. Then follow the military details with the name of the deceased and the date of his death, below which is carved the symbol of his faith, while at the foot of the stone is engraved a personal inscription chosen by the next-of-kin. Of the two central monuments the great altar-like Stone of Remembrance, designed by Sir Edwin Lutyens bears the inscription chosen by Mr. Rudyard Kipling, "Their name liveth for evermore." The other memorial is the great Cross of Sacrifice designed by Sir Reginald Blomfield, to the shaft of which is fixed a crusader's sword of bronze.

In addition to the marking and care of the graves the commission were entrusted with the commemoration of the missing dead or those sailors and soldiers who have no known graves. This is no small task, for the number of these is over 400,000. Several memorials to the missing dead had been completed by the end of 1925. Among these are the three Naval Memorials to those lost at sea which stand on prominent sites at the three ports which throughout Britain's naval history have been intimately connected with the sea service. Other memorials to the missing are those at Cape Helles, at Lake Doiran in Macedonia, at Port Tewfik and at the Menin Gate, Ypres. The last, which was still under construction in 1925, bears the names of some 60,000 officers and men "... who fell in Ypres Salient, but to whom the fortune of war denied the known and honoured burial given to their comrades in death." Cemetery and memorial registers are published by the commission. These registers when finished will present a complete record of the Empire's dead.

The unprecedented nature of the task with which the commission was charged is obvious; its complexity and magnitude will be realised when it is remembered that the 725,000 known graves for which they were responsible were scattered all over the world in many different countries with different laws and customs, some of them the enemy countries with whom special provisions were made in the Treaties of Peace to ensure the graves being respected; and there are no less than 15,000 burial places in different parts of Europe and the East where British sailors and soldiers rest, the great majority being in civil cemeteries containing small groups of graves, but some 1,500 of them being cemeteries of considerable size, the largest containing 12,000 graves. As has been seen, the permanent construction work carried out in these cemeteries is of a simple but durable kind, but the commission's gardeners set to work immediately after the Armistice, without waiting for the erection of the permanent headstones, planting shrubs, grass and flowers.

*Permanent Maintenance.*—As a guarantee that the graves and memorials shall be forever cared for, the various Governments

<sup>1</sup> Later on, the governments of Belgium, Italy, Greece, Egypt and Palestine followed the lead of France by passing equally generous measures.

of the Empire represented on the commission have undertaken to provide permanently the income required for maintenance at the accepted standard of upkeep laid down by the commission. After discussion it was agreed that an endowment fund amounting to £5,000,000 should be established for this purpose by the United Kingdom and Dominion Govts. and this fact was announced to the House of Commons on July 30 1925, by Sir Laming Worthington-Evans, at that time chairman of the commission. Sir Herbert Lawrence, Mr. E. R. Peacock and Sir Fabian Ware were appointed the first trustees of the endowment fund. On the occasion of their appointment, the Prince of Wales wrote in a letter to the chairman "we shall thus be able to honour the pledge given to all the relatives of the dead who can now be assured that the last resting-places of those whom they lost in the War will be properly cared for."

*French and American Graves.*—While, as a rule, the Allies adopted methods of commemorating the fallen similar to those described above, the great differences in the numbers of their casualties and in the conditions obtaining in the different countries rendered certain divergences unavoidable. France, on whose soil lay over three million allied and enemy dead, was faced with the problem of honouring her fallen soldiers without clogging the wheels of industry and agriculture, which were beginning to revive under peace conditions, even in the devastated areas where the graves lay thickest. The British helped to solve the difficulty by concentrating all isolated graves into cemeteries which would forever mark the British battle-line. The French adopted the further expedient of giving the next-of-kin the opportunity of having their dead re-buried at the state's expense in the churchyard or burial-ground of their native place, while those who were left would rest in great national cemeteries constructed by the state as a lasting monument to the heroism of the soldiers who died for France.

Many of the fallen soldiers of the American Expeditionary Force were borne back across the Atlantic to rest in their native land. The American authorities would no doubt have hesitated to undertake a task of such difficulty had not a pledge been given before a single American battalion left the United States that no American soldier who died fighting for his country and the liberties of nations should be left to lie on foreign soil except at the express wish of his next-of-kin. Of the 100,000 American dead, those left to rest in France were grouped together in three or four great cemeteries. The plan of construction of these cemeteries is based on the principle of uniform treatment of the graves, a conception which appears to have been first put into practice by those who laid out Arlington National Cemetery, the burial place of those who fell in the American Civil and other wars of the United States. (F. W.)

**WARREN, WHITNEY** (1864— ), American architect, was born in New York City Jan. 29 1864. After studying at the École des Beaux Arts, Paris, under Daumet and Girault (1885-94), he began the practice of architecture in New York, later becoming associated with Charles D. Wetmore in the firm of Warren and Wetmore. They specialised in railway architecture, hotels, business buildings and residences, and were architects for the New York Central, Michigan Central, Canadian Northern and Erie railways. Their numerous structures in New York City include the Chelsea docks, the Grand Central Station and the hotels Belmont (1905), Vanderbilt (1910), Biltmore (1912) and Commodore (1916). Warren was an intimate friend of d'Annunzio, accompanying him to Fiume, and was later appointed diplomatic representative in the United States of the "free state of Fiume." In 1920 he was chosen by the international committee to reconstruct the library of the University of Louvain, destroyed by the Germans in 1914. He was the author of *Témoignage d'un Citoyen Américain, Les justes revendications de l'Italie: la question de Trente, de Trieste et de l'Adriatique* (1918). Many of his addresses were published and widely distributed.

**WARSAW** (see 28.334), the capital of Poland, had a population of 931,176 in the city alone, and 936,046 in the administrative district of 121 sq. km., in 1921; 72.3% were Poles and 34.6% Jews. The municipality had a substantial surplus in 1924, and

work was begun on extending the water and drainage systems; it was also proposed to build slaughter houses and lay fresh paving. The suburban electric railway is being extended to Żyrardów. Since the foundation of an Orthodox Church, independent of the Russian Patriarch, in 1922, Warsaw has been the seat of its archbishop. There is also an exarchate of the Russian church, and a Roman Catholic archbishop. The Russian cathedral, the outward sign of Russian domination, has been demolished, and the university, evacuated during the War, was reorganised in 1918 as a Polish body. The bridges over the Vistula were destroyed by the Russians in their retreat. The Poniatów bridge, joining Warsaw to the suburb of Praga, was reopened in 1925. Another bridge was rebuilt at once by the Germans. A French Institute was built in 1925, and the erection of a radium institute and hospital was begun as a national monument to Madame Curie, a native of Warsaw, who laid the foundation stone. A Soviet chamber of commerce was opened in 1926. Stubborn battles between the Russian and German forces took place in the neighbourhood of Warsaw in 1914. In 1915 the Russians withdrew to the right bank of the Vistula, and the Germans entered the city. The first Polish parliament was held in Warsaw in 1919 (see VISTULA-SAN, BATTLES OF THE).

**WASHINGTON, BOOKER TALIAFERRO** (1859-1915), American negro teacher and reformer (see 28.344), died at Tuskegee, Ala., Nov. 14 1915, as the result of a breakdown due to overwork. He was the author of *My Larger Education: Being Chapters from My Experience* (1911) and *The Man Farthest Down; a Record of Observation and Study in Europe* (1912).

See B. F. Riley, *Life and Times of Booker T. Washington* (1916).

**WASHINGTON, D.C.** (see 28.349), capital of the United States, enjoyed its share of prosperity following the close of the World War and grew in importance and population until its inhabitants numbered in 1925 approximately 500,000, one-third of whom were born within the District. Many thousands of federal employees were brought there for war purposes in 1917, on whose subsequent departure the government force resumed normal conditions. The city is becoming more beautiful each year with its added parks and attractive buildings, and an average of 9,000 visitors register at its hotels every day. To regulate automobile traffic, which constituted one of the city's chief problems, a traffic bureau was provided in 1925.

*Buildings.*—An idea may be gained of the value of improvements steadily going on in the district by a reference to the assessment, at full value, for the buildings erected during the years 1923, 1924 and 1925, the total for the three years being \$86,366,211, that for 1925 alone being \$42,729,000. The most beautiful and important building recently erected is the head-quarters of the chamber of commerce of the United States, located opposite the White House on ground where once stood the residence of Daniel Webster. It is for the use of American business men, including more than 1,350 chambers of commerce and trade associations and 15,000 business firms and individuals scattered over the United States and the world. The building consists of a series of meeting-rooms seating from 125 to 400 persons each, and an auditorium with a seating capacity of 1,000. Another building recently erected is the Washington Auditorium at 1900 E street, N.W., with a seating capacity of 6,000. At Ninth street and New York avenue is a new building erected by the American Federation of Labor as its head-quarters. The Gallinger Hospital, in the extreme southeast part of the city, was opened in 1923 to the district poor, for whom it was constructed. The corner stone of the Victory Memorial building in the Mall at Seventh and B streets, N.W., was laid by President Harding Nov. 14 1921. The building is to be erected by private subscriptions and when finished is to cost \$10,000,000.

Other important buildings begun or completed include the John K. Mullen Memorial Library in the grounds of the Catholic University of America, the corner stone of which was laid by Cardinal Hayes on April 22 1925, the Jewish Community Centre, at Sixteenth and Q streets, N.W. (corner stone laid on May 3 1925), the Wardman Park Hotel, the Hotel Washington and a large number of other hotels and apartment houses. A proposed

structure is the new home of the National Press Club to cost \$9,000,000 and to occupy the site of the Ebbitt Hotel at F and Fourteenth streets, N.W. The Francis Scott Key bridge has been opened to traffic, and work on the Episcopal Cathedral of SS. Peter and Paul is making good progress. To give better access to Arlington National Cemetery and contiguous parts of Virginia, a new bridge is to span the Potomac beyond the Lincoln Memorial. This will be one of the most handsome bridges in the world and will cost together with its approaches \$14,750,000; it will be completed about 1930. A much needed local improvement now nearly completed is the new water service. Including the \$3,000,000 aqueduct from Great Falls, 14 m. northwest of Washington, the necessary reservoirs and other incidental work, the total cost of this undertaking will be \$9,160,000. This service will augment the district water supply by 100,000,000 gal. of water a day, and together with the old service, which has been in use for 65 years, will give the city a total water supply of 180,000,000 gal. a day, enough for a population of 1,000,000 inhabitants. In the District of Columbia there are 70 major buildings that are Government-owned, the total value of federal property being estimated at \$275,348,737.

**Streets and Parks.**—In 1925, Congress provided for a National Capital park commission, to have at its disposal an annual appropriation for the purchase of parks and recreation grounds, and the 6,000 and more acres now set aside for these purposes will hereafter receive regular and substantial additions; already 54% of the city is in parks, streets and alleys. There are 527 m. of streets in the District, paved and unpaved. Asphalt predominates, though many of the roadways are of cement and macadam, comparatively few being unpaved. Congested traffic conditions are being relieved by widening the roadways in the downtown area; Thirteenth street from F to I has been treated in this way, and a number of others are to follow.

**Monuments and Memorials.**—A number of these have been added to the city's parks and reservations, the more prominent being the Dupont Memorial in Dupont circle; the statue of Dante, by Ettore Ximenes, sculptor and Whitney Warren, architect, unveiled in Meridian Hill Park, Dec. 1 1921; Joan of Arc (a copy of the original statue which stands in front of the cathedral in Rheims, France) unveiled in the same park, Jan. 6 1922, by Mrs. Harding, wife of the President, and Mme. Jusserand, wife of the French Ambassador; a memorial to Joseph J. Darlington in Judiciary square, executed by C. P. Gennewein; statue of Edmund Burke (gift of Sulgrave Institute) at Massachusetts avenue and Eleventh street, N.W., unveiled Oct. 12 1922; equestrian statue of Gen. U.S. Grant, by Henry Merwin Shrady, sculptor, in the Botanic Garden, facing the Capitol building, unveiled April 27 1922; statue of Alexander Hamilton, first Secretary of the U.S. Treasury, unveiled May 17 1923; shaft south of State, War, and Navy building, erected to the memory of more than 5,000 men of the First Division, U.S.A., who died in the World War; statue of Bishop Francis Asbury of the Methodist Episcopal Church, unveiled at Sixteenth and Mount Pleasant streets, Oct. 15 1924; and a duplicate of the famous statue by Dumont of Gen. San Martin, in Buenos Aires, being erected in Judiciary square. A memorial to John Ericsson, to form the first portion of the Arlington Memorial bridge, will be completed in 1926.

**Education.**—The District is making rapid progress in education. Early in 1925, Congress authorised a five-year building programme. The Act will make it possible to abandon in a few years the many unsuitable buildings now in use and will reduce elementary classes to a standard of not more than 40 pupils to a class. This bill, effective July 1 1925, provides for additions of something like 220 rooms to school buildings already erected; a number of junior high schools, a new manual training school, a new business high school, six buildings for graded schools to contain 92 rooms, together with gymnasiums, assembly halls, rest rooms, dining rooms and kitchens. A considerable number of sites are also provided for. The Appropriation Act for the fiscal year 1925-6 provides for new buildings and grounds to cost \$4,176,500, \$5,168,000 for teachers' salaries and \$2,812,437 for textbooks, repairs, etc.—a total for educational purposes of

\$12,156,937. In the years 1921-5, approximately \$7,000,000 was spent for building sites and buildings. The enrolment of pupils at the close of school in June 1925 was 67,000.

**Manufactures.**—The output of manufactured products is rapidly growing; the total aggregate output was \$73,108,000 in 1923. Printing and publishing newspapers and periodicals are the most important industries. Their total output amounted to \$18,227,000, an increase of 20.1% over 1921. The number of persons employed was 1,308, a figure slightly exceeded by the number of employed in the bread and other bakery industries. The average number of wage-earners employed in privately owned factories with output valued at \$5,000 or more was 9,823, and the total wage payments \$14,796,000.

**Finance.**—One of the principal indications of the district's healthy financial condition is its personal income tax returns. Of less than half a million people living there in 1923, 75,796 made returns showing a net income of \$284,622,234, or 1.8% of the nation's total; the income taxes paid amounted to \$8,083,050. A smaller total of tax was paid by each of 34 states. While only 6.94% of the nation's population filed income tax returns during this period, 15.92% of the district's residents submitted returns. (J. C. P.)\*

**WASHINGTON** (see 28.353), a state of the United States of America. The population in 1920 was 1,356,621, an increase of 214,631 or 18.8% over the population of 1910, as against an increase of 120.4% in the preceding decade. The density of population in 1920 was 20.3 per sq. m.; in 1910, 17.1. The urban population (in 35 places of 2,500 or more) was 55.2% of the whole, as against 53% in 1910. The population of cities having more than 90,000 inhabitants was:—

|                   | 1920    | 1910    | Increase<br>per cent |
|-------------------|---------|---------|----------------------|
| Seattle . . . . . | 315,312 | 237,194 | 32.9                 |
| Spokane . . . . . | 104,437 | 104,402 | .003                 |
| Tacoma . . . . .  | 96,965  | 83,743  | 15.8                 |

The most significant change in the characteristics of the population was the increased number of Japanese, and especially Japanese women. In 1920 there were 17,114 Japanese, or 1.3% of the total, the percentage of males being 65.3. One reason for the proportional increase of females was the privilege, prior to the legislative session of 1921, of acquiring title to land in the names of native-born children of Japanese parents. The total population in 1925 was estimated by the United States Bureau of Census to be 1,510,280.

**Agriculture.**—During the decade 1910-20 the number of farms increased from 56,192 to 66,288; the acreage of improved land from 6,373,311 ac. to 7,129,343 ac.; and the value of all farm property from \$637,543,411 to \$1,057,429,848. The average value of land per ac. in 1910 was \$44.18; in 1920, \$60.22. By 1925 the number of farms had increased to 73,266. The following table shows changes in acreage, production and value of chief crops:—

| Year               | Acreage<br>(In thousands) | Production<br>(In thousands) | Value<br>(In thousands) |
|--------------------|---------------------------|------------------------------|-------------------------|
| Wheat . . . . .    | 1909 2,118                | 40,920 bu.                   | \$35,102                |
|                    | 1919 2,494                | 41,838 bu.                   | 91,207                  |
|                    | 1925 2,072                | 36,848 bu.                   | 47,981                  |
| Oats . . . . .     | 1909 270                  | 13,228 bu.                   | 5,871                   |
|                    | 1919 192                  | 8,073 bu.                    | 8,073                   |
|                    | 1925 254                  | 11,176 bu.                   | 5,812                   |
| Barley . . . . .   | 1909 172                  | 5,835 bu.                    | 3,332                   |
|                    | 1919 85                   | 2,250 bu.                    | 3,375                   |
|                    | 1925 91                   | 3,094 bu.                    | 2,104                   |
| Maize . . . . .    | 1909 26                   | 563 bu.                      | 404                     |
|                    | 1919 35                   | 902 bu.                      | 1,623                   |
|                    | 1925 58                   | 2,030 bu.                    | 1,928                   |
| Potatoes . . . . . | 1909 58                   | 7,667 bu.                    | 2,994                   |
|                    | 1919 55                   | 5,867 bu.                    | 12,320                  |
|                    | 1925 54                   | 7,840 bu.                    | 12,920                  |
| Hay . . . . .      | 1909 743                  | 1,400 tons                   | 17,200                  |
|                    | 1919 1,064                | 2,014 tons                   | 47,717                  |
|                    | 1925 943                  | 2,103 tons                   | 31,471                  |

Crops of increasing importance are bulbs, flowers, vegetable seeds, flax, filberts and English walnuts. Prohibition increased enormously the demand for berry juices. Three-fifths of the loganberries produced in the United States come from Washington (1,157,778 qt. in 1919, valued at \$208,402). The evergreen wild blackberry (supposed to have been introduced from Hawaii) is spreading through the river valleys, and the fruit is shipped in carload lots to the canneries. The production of the chief orchard crops in 1915, 1920 and 1925 in thousands of bushels was as follows:—

|                   | 1915  | 1920   | 1925   |
|-------------------|-------|--------|--------|
| Apples . . . . .  | 7,300 | 21,502 | 28,700 |
| Pears . . . . .   | 564   | 1,140  | 2,300  |
| Peaches . . . . . | 566   | 155    | 870    |

The following table shows the growth in number and value of domestic animals during the decade 1910-20:—

|                      | Year | Number  | Value        |
|----------------------|------|---------|--------------|
| Horses . . . . .     | 1910 | 280,572 | \$ 9,680,849 |
|                      | 1920 | 296,381 | 25,069,336   |
| Mules . . . . .      | 1910 | 12,185  | 1,776,297    |
|                      | 1920 | 23,091  | 2,930,813    |
| Milch cows . . . . . | 1910 | 186,233 | 7,988,133    |
|                      | 1920 | 289,635 | 23,648,537   |
| Sheep . . . . .      | 1910 | 475,555 | 1,931,170    |
|                      | 1920 | 623,779 | 7,750,407    |
| Swine . . . . .      | 1910 | 206,135 | 1,674,927    |
|                      | 1920 | 264,747 | 5,049,249    |

In 1917-8 condenseries used 205,657,654 lb. of whole milk to produce 1,844,097 cases of condensed milk, valued at \$8,870,825. Cream and butter were sent to the cities from 110 creameries. In 1919 in 19 factories the production of cheese was 2,004,365 lb., valued at \$348,669.

During the decade 1910-20 the irrigated farms increased from 7,664 to 13,271, irrigated acreage from 334,378 ac. to 529,899 acres. The Reclamation Service of the Federal Govt. has impounded the waters in Keechelus Lake (Kittitas county) and other lakes to serve large projects in the Yakima valley. The largest enterprise is the Columbia Basin project, to utilise the waters of Pend d'Oreille lake and river for the irrigation of 1,750,000 acres.

**Mining.**—For all producing mines and quarries, the number of enterprises in 1919 was 83, and in 1909, 93; the average number of wage-earners in 1919 was 5,050, and in 1909, 6,904; the aggregate horsepower used in 1919 was 38,198, and in 1909, 20,742; wages in 1919 were \$7,466,000, and in 1909, \$5,891,000; value of products in 1919 was \$13,329,000, and in 1909, \$10,538,000. Production of gold in 1924 was 13,000 fine oz.; in 1920, 7,000 fine oz.; in 1910, 39,000 fine ounces. Production of silver in 1924 was 194,000 fine oz.; in 1920, 178,000 fine oz.; in 1910, 205,000 fine ounces. Production of copper (in lb. fine) was 979,000 in 1924; 2,126,000 in 1920; 65,000 in 1910. Production of coal (in net tons) was 2,400,000 in 1924 (estimated); 3,757,000 in 1920; 3,912,000 in 1910. In the decade 1910-20 five new cement plants were established in the State, and large quantities of Portland cement were exported. Of increasing importance are clay products, such as paving brick, sewer pipe and terra cotta.

**Manufactures.**—The following table shows changes in manufactures between 1909 and 1923:—

|                                  | 1923          | 1919          | 1909          |
|----------------------------------|---------------|---------------|---------------|
| Establishments . . . . .         | 3,029         | 4,918         | 3,674         |
| Wage-earners (average) . . . . . | 111,663       | 132,928       | 69,120        |
| Wages . . . . .                  | \$156,435,000 | \$194,968,000 | \$49,766,000  |
| Primary horsepower . . . . .     | 593,330       | 687,436       | 297,897       |
| Cost of materials . . . . .      | \$372,044,000 | \$443,178,000 | \$117,888,000 |
| Value of products . . . . .      | \$678,543,000 | \$809,623,000 | \$220,746,000 |

The chief items were lumber and timber products, flour-mill and grist-mill products, slaughtering and meat-packing, butter,

cheese and condensed milk, malt liquors, salmon fishing, canning and preserving. The State contains 16% of the total water-power resources in the United States.

**Ports.**—During and immediately after the World War the commerce passing through the district of Puget Sound was second only to that of New York. A law approved on March 14 1911, authorised the organisation of ports. Seattle, Tacoma, Aberdeen and other cities have taken advantage of this law to improve their harbours and to build great wharves and other conveniences to handle the increasing commerce.

**Highways.**—The State has embarked upon the task of providing an extensive system of improved roadways. These include the Washington link of the Pacific Highway, intended to extend from Alaska to the Straits of Magellan, another highway around Puget Sound to the Pacific; and highways across the Cascade Range and eastern Washington.

**Forests and Parks.**—The Federal Govt. maintains the Mount Rainier National Park (324 sq. m.) and the Mount Olympus National Monument (299,370 acres). National forests include 12,000,000 ac. within the State.

**History.**—Ernest Lister, Democrat, became governor in 1913 and was re-elected in 1916. He died June 14 1919, and was succeeded by Lt.-Gov. Louis F. Hart, Republican. Governor Hart was re-elected in 1920. He recommended what is known as the Governor's Administrative Code of 1921, one of the most significant changes in the State government since its organisation. In 1921 the legislature passed a law restricting alien ownership of land, aimed especially at the Japanese. The word "alien" is so defined that it does not include an alien who has in good faith declared his intention to become a citizen of the United States, but does include all other aliens and all corporations and other organised groups of persons, a majority of whose capital stock is owned or controlled by aliens or a majority of whose members are aliens. Gov. Hart was succeeded by Roland H. Hartley.

Commerce developed rapidly during the years 1910-26. In Seattle there were, in 1921, 24 resident consuls representing foreign countries. The greater number of vessels coming to ports of Puget Sound were under the Japanese flag and branches of Japanese banks were established. Progressiveness was shown in such legislation as the working men's compensation law (1911), initiative and referendum (1913), recall of public officers (1913) and aid for destitute mothers (1915). To meet the high cost of government the legislature in 1921 enacted laws levying a poll-tax on every person between the ages of 21 and 50, and a tax of one cent on each gallon of gasoline used by motor vehicles; the tuition charges in State institutions of learning and the fees for licences for automobiles and for fish dealers and others were also increased. (E. S. M.)

**WASHINGTON CONFERENCE.**—Preliminary invitations to a Conference at Washington on the limitation of national armament "in connection with which Pacific and Far Eastern questions could also be discussed" were issued by President Harding in July 1921, to Great Britain, France, Italy and Japan. On Aug. 11, formal invitations were sent to these Powers, to China and later to Belgium, the Netherlands and Portugal, President Harding having been authorised by Congress on July 11 1921, to arrange for the conference. As American delegates Mr. Harding designated Secretary of State Hughes, Elihu Root, Senators Lodge and Underwood; the British Empire was represented by Mr. Balfour (as he then was) Lord Lee of Fareham, Sir Auckland Geddes and Sir Robert L. Borden, as principal delegates; France by M. Briand, M. Viviani, M. Sarraut and M. Jusserand; Italy by Signor Schanzer and Signor Ricci; Japan by Prince Tokugawa, Admiral Kato and Ambassador Shidehara; China by Mr. Wellington Koo and Mr. Sze.

**Opening of the Conference.**—The conference assembled on Nov. 12 1921, was addressed by Mr. Harding, and elected Mr. Hughes as its chairman. The latter at once placed the American proposals on naval disarmament before the gathering; they were so precise and far-reaching as to cause general surprise. Mr. Hughes proposed that there should be a naval "holiday"; "for

a period of not less than 10 years there shall be no further construction of capital ships." He then presented a definite plan for the scrapping of certain of the older capital ships and of capital ships under construction, and the restriction of capital ship replacements by an agreed maximum of tonnage, as follows: for the United States and Great Britain 500,000 tons each, for Japan 300,000 tons—a "5-5-3" ratio. Discussion of the tonnage allowance for France and Italy was reserved for later consideration. The directness with which Mr. Hughes stated his case evoked hearty response from the delegates and the public, and he was at once supported by the British delegation. "We can no longer content ourselves," Mr. Hughes said, "with investigations, with statistics, with reports, with the circumlocution of inquiry. . . . The world wants a practical programme which shall at once be put into execution." At the second plenary conference, held on Nov. 15, the representatives of France, Japan and Italy also accepted the principles of the Hughes proposals, leaving the technical details for consideration by the experts.

In the plenary session of Nov. 21 the subject of military armament was introduced by Mr. Hughes, who said that the United States had followed its traditional policy of reducing its own regular military establishment to the smallest possible basis. He recognised, however, the special difficulties existing in Europe. M. Briand explained the attitude of France as based on her need for security in Europe; expressing the readiness of his country to take any steps necessary to ensure peace, he emphasised the necessity of a genuine atmosphere of peace, a "moral disarmament," before physical disarmament could be attempted. This atmosphere, he maintained, was lacking—chiefly because of what France regarded as the incomplete pacification of Germany. France, he claimed, had already reduced her army by a third, and was planning to reduce it by a half. Complete demobilisation, however, was impossible for her under the conditions existing in Germany and Russia. M. Briand concluded with an appeal for the moral support of France by other nations, and this evoked a sympathetic response. Signor Schanzer, however, made plain the desire of Italy that "the general limitation of land armaments may become a reality within the shortest space of time." The result of the attitude of France was to establish the impracticability of discussing any definite plan for the limitation of armies. A sub-committee was appointed, however, to consider the question of aircraft, poison gases and the rules for the conduct of war.

The agenda of the conference were dealt with by two committees of the whole, one composed of the delegates of the five principal Powers to deal with limitation of armament, the other composed of delegates of all nine Powers to deal with matters affecting the Pacific and the Far East.

Meetings of these committees and their sub-committees were not open to the public; their results were reported formally at the open plenary sessions, of which six were held. The decisions reached were in regard to navies, including submarines; poison gases; the Pacific Ocean and its islands; and Chinese affairs.

*The Question of Capital Ships.*—The committee on armament discussed fully the maximum tonnage and ratio of capital ships to which each Power should restrict itself; and on Dec. 20 a provisional agreement was reached. Japan maintained (Dec. 20) that 60% of the quota proposed for the United States and Great Britain was insufficient for her defensive needs, and asked that it be increased to 70%; her delegates were especially unwilling to sacrifice the "Mutsu," a new capital ship (in large measure paid for by popular subscription), which, under the Hughes plan, would have to be scrapped. This obstacle was overcome by permitting Japan to retain the "Mutsu," on condition that an older ship, the "Setsu," should be scrapped. This change gave Japan two post-Jutland ships and an increased capital-ship tonnage, to offset which it was agreed that the United States should complete two ships still in process of construction, and that Great Britain should construct two new vessels not to exceed 35,000 tons each. In replacement tonnage the ratio was to stand thus: United States and Great Britain 525,000 tons each and Japan 315,000 tons—a ratio of 5-5-3.

This agreement was stated to be contingent upon a suitable arrangement for France and Italy, who had been offered a replacement tonnage of 175,000 each. But M. Sarraut, representing France, held out for an aggregate of 350,000 tons, to be constructed on a replacement basis from 1925 onwards. The controversy was finally laid before M. Briand, who had returned to France; he agreed to accept for France the maximum of 175,000 for capital ships, but made his consent conditional on the obtaining of a larger proportion of auxiliary craft and submarines, which were regarded by France as purely defensive weapons. "The idea which dominates the Washington Conference," he telegraphed, "is to restrict naval armaments which are offensive and costly. But I do not believe that it is the programme to deny to a nation like France, which has a large extent of coast and a great number of distant colonies, the means of defending its communications and its security."

*The Question of Submarines.*—The French reply settled the problem of capital ships, but a warm controversy was provoked over submarines. Mr. Balfour proposed their complete abolition. Mr. Hughes proposed a reduction of submarine tonnage for the United States and Great Britain to 60,000 apiece, and approximately the *status quo* for France, Japan and Italy (31,500 for the first two, 21,000 tons for the last). But the French delegates refused to accept less than 90,000 tons for submarines and 330,000 for cruisers and auxiliary craft. Mr. Balfour then made it plain that, failing action against the submarine itself, Great Britain could accept no limitation for anti-submarine craft.

As a result, the treaty, as finally agreed upon by the five major Powers, did not include limitation of total tonnage of submarine or auxiliary craft. Limits, however, were placed upon the total tonnage of aircraft carriers and upon individual tonnage of capital ships and cruisers, as well as upon the calibre of guns carried.

The failure of the British attempt to abolish the submarine was mitigated by the passage of a series of resolutions presented by Mr. Root and later embodied in a treaty. As accepted, they stated the rules of international law as to "visit and search" on the high seas, and declared that belligerent submarines are not exempt from these rules. They invited the adherence of all civilised Powers to this statement. In the third place, they recognised that the use of submarines as commerce destroyers was practically impossible without violation of these rules, and that prohibition of such use should be accepted as a law of nations; they declared the assent of the contracting Powers to such prohibition, and invited that of all other nations. No definition of a merchant ship was adopted. In the fourth place, they declared that commanders of all ships transgressing international rules should be subject to punishment for piracy. Aircraft limitation was rejected by the conference, after a technical report of the sub-committee had declared limitation to be impracticable, but an inquiry commission was appointed. The abolition of the use of poison gas in international warfare, on the other hand, was advocated by the Naval Committee Jan. 7 1922, on the motion of Mr. Hughes, and prohibition of poison gas was embodied in a treaty.

*Problems of the Pacific.*—In respect of the problems of the Pacific a new treaty was drafted and presented at the plenary session, Dec. 10 1921, between the United States, Great Britain, France and Japan. It pledged each to respect the rights of the others in relation to their insular possessions and insular dominions in the Pacific, to accept mediation in case of controversy over these possessions and to open frank discussions if their rights were threatened by any other Power. The treaty was to remain in force for 10 years, and upon its ratification the Anglo-Japanese Alliance was automatically to be terminated. A reservation accompanied the treaty embodying provisions to the effect that it should not be deemed an assent on the part of the United States to "mandates" granted in the Pacific under the Peace Treaty of Versailles, and should not preclude agreements relative to mandated islands. (See SINGAPORE.)

The reservation also excepted from arbitrable controversies questions lying within domestic jurisdiction of the contracting Powers. To the treaty was later appended a second agreement,

defining the phrase "insular possessions and insular dominions" in such a way as to exclude Japan proper from its scope. The representatives of the United States and Japan also signed a treaty regarding Yap, according to which the United States was to have free access there on a footing of entire equality with Japan in all that related to cable and radio service, and received certain privileges and exemptions in relation to electrical communications. Subject to various conditions the United States consented to the administration by Japan of the mandated islands in the Pacific north of the equator.

*Attitude Towards China.*—Chinese problems were presented (Nov. 16 1921), by Mr. Sze in the form of 10 points, which the conference was asked to adopt (*see CHINA*). They called for recognition of the territorial integrity and political and administrative independence of China, the "open door" neutrality and the complete removal of all political, jurisdictional and administrative restrictions upon the Chinese Republic. The general attitude of the conference towards China was crystallised (Nov. 21) when four resolutions presented by Mr. Root were adopted. They declared the intention of the Powers to respect the sovereignty, the independence and the territorial and administrative integrity of China, their desire to maintain the principle of equal opportunity for the commerce and industry

of all nations and their agreement not to seek special rights or privileges. Details of specific arrangements to be enforced led to long discussions. A resolution was adopted (Dec. 24) providing for the voluntary withdrawal of foreign post-offices from China Jan. 1 1923, on condition that China should maintain efficient service and continue the supervision of the foreign co-director-general. The problem of extra-territorial rights could not be settled definitely, but it was referred to an international committee for intensive study and report within a year. The demand for the withdrawal of foreign troops from China was referred to a sub-committee, and finally it was agreed that, while the principle of withdrawal was accepted, the issues raised should be made the subject of inquiry, in order to determine the conditions upon which withdrawal must depend.

On the other hand, the Powers passed a resolution urging China to reduce the large military forces maintained by the military governors. The relinquishment of foreign leaseholds in China was not actually secured (though Great Britain announced her readiness in this respect if other countries would join her); but China's fight for "open diplomacy" was virtually won when a resolution was passed (Dec. 8) pledging the nine Powers not to enter into any agreement that might impair the force of the four Root resolutions. As regards the customs tariffs, the demand of

Map showing the mandates affecting the Islands of the Pacific as laid down by the Washington Conference. Tinted areas not to be fortified further. Fiji (with Rotuma Island) forms a British Colony by itself. Other British Possessions (excluding Australia and New Zealand) are under the administration of the High Commissioner for the Western Pacific.

China for complete autonomy was not granted, nor the request made, in view of the nation's financial necessities, that her quota be raised from 5% to 12½%. It was decided, however, that China's customs revenue should be increased by \$46,000,000 silver annually, through an advance to 5% effective, a surtax of 2½% and a surtax not exceeding 5% on luxuries. The Treaty provided for the convening of a Tariff Revision Commission at Shanghai, the opening of which was delayed until Oct. 1925, owing to the internal troubles of China. Other resolutions included agreements that foreign radio stations should transmit only government messages, that there should be no unfair discrimination in railway rates, an expression of hope that the railway system might be unified under Chinese Govt. control, and an agreement for the establishment of a board of reference for Far Eastern questions.

*Shantung.*—The question of the Japanese occupation of Shantung entailed long negotiations which at times seemed to reach a dead-lock, especially those relating to the Tsingtao-Tsinan-fu Railway. Largely through the mediation of Mr. Hughes and Mr. Balfour, a separate agreement was finally reached between Japan and China and signed Feb. 4. It provided for the return to China of the former German leasehold and 50-km. zone in Shantung, and the withdrawal of Japanese troops and gendarmes; China was to purchase the Tsinan-fu Railway for \$30,000,000, but, before complete redemption, there were to be appointed a Japanese traffic manager subject to the direction of the Chinese managing director, a Japanese accountant and a Chinese accountant of equal rank. Japan renounced all rights to foreign assistance stipulated in the Chinese-German Treaty of 1898, and relinquished the maritime customs at Tsingtao and former German public properties. As to Siberian problems, Baron Shidehara made a full statement to the effect that it was "the fixed and settled policy" of Japan to respect the territorial integrity of Russia, and to observe the principle of non-intervention in the internal affairs of that country, as well as the principle of equal opportunity for the commerce and industry of all nations.

*The Treaties.*—The decisions taken by the conference were embodied in seven treaties and various supplementary resolutions: (1) *Five-Power Treaty Limiting Naval Armaments*, designating the capital ships to be retained by each contracting Power and determining the ratio of capital ship replacement—\$25,000 tons for the United States and Great Britain, 315,000 tons for Japan, 175,000 tons for France and Italy each—or 5-5-3-1.66. This treaty also limited the tonnage of individual capital ships to 35,000 and the calibre of guns to 16 inches; individual cruisers were limited to 10,000 tons and their guns to eight-inch calibre. Aircraft carriers were limited in general to an individual tonnage of 27,000 with a total tonnage of 135,000 for the United States and Great Britain, 81,000 for Japan, 60,000 for France and Italy each. With certain exceptions the *status quo* was to be maintained with regard to fortifications and naval bases in the Pacific. (2) *Five-Power Treaty Relating to the Use of Submarines and Noxious Gases in Warfare*, embodying the resolutions described above. Accompanying these treaties were two resolutions for a commission of jurists to consider amendment of the laws of war and limitation of their jurisdiction. (3) *Four-Power Treaty*, between the United States, Great Britain, France and Japan, relating to the insular possessions and the insular dominions in the Pacific Ocean, with an accompanying Declaration.

(4) *Four-Power Treaty*, between the same Powers relating to the foregoing, and defining "insular" so as to exclude Japan proper from its scope. (5) *Nine-Power Treaty*, relating to principles and policies to be followed in matters concerning China, as described above. This was supplemented by 10 resolutions embodying the decisions taken as to a board of reference, extra-territoriality, foreign postal agencies, foreign armed forces, unification of railways, Chinese military forces, existing commitments of China or, with respect to China, the Chinese Eastern Railway. The treaty embodied the Root resolutions as its Article I., and strongly emphasised the principles of the "open door." (6) *Nine-Power Treaty*, relating to Chinese customs tariffs. (7)

*Chinese-Japanese Treaty*, regarding Shantung. Two other treaties connected with the work of the Conference were: *United States-Japanese Treaty*, regarding Yap; and the *Six-Power Treaty*, allocating German cables in the Pacific. The Conference on Limitation of Armament was formally terminated Feb. 6 1922. On March 1 the U.S. Senate ratified, by a vote of 67 to 22, the treaty with Japan regarding Yap.

By June 9 1923, all the signatory Powers except France had ratified the Five-Power Treaty in relation to the use of Submarines and Noxious Gases in Warfare, the Nine-Power Treaty relating to Principles and Policies to be followed in Matters concerning China, and the Nine-Power Treaty relating to Chinese Customs Tariff. France ratified the last two on July 20 1925, but had not, up to Feb. 1926, ratified the treaty in relation to the use of Submarines and Noxious Gases. By July 28 1923, all the signatory Powers had ratified the Five-Power Treaty limiting Naval Armaments; also the Four-Power Treaty relating to Insular Possessions and Insular Dominions in the Pacific Ocean, the Declaration accompanying this treaty, and the treaty supplementary thereto.

Norway adhered on Sept. 23 1925, to the treaty relating to Chinese Customs Tariff; and on Nov. 13 1925, to the treaty relating to Principles and Policies concerning China. Denmark and Sweden signified their adherence to the treaty relating to Chinese Customs Tariff on Aug. 27 1925 and Sept. 11 1925, respectively.

**WASSERMANN, AUGUST VON** (1866-1925), German professor of medicine, was born Feb. 21 1866 at Bamberg, in Bavaria. He studied in Erlangen, Munich, Strasbourg and Vienna, and in 1888 began to practise as a physician in Strasbourg. He was then engaged as an assistant to the Robert Koch Institute for Infectious Diseases, Berlin, where, from 1906, he directed the department of experimental therapy and serum research. In 1913 he became director of the Kaiser Wilhelm Institute in Berlin-Dahlem. Wassermann achieved international fame and reputation by his discovery of sero-diagnosis in syphilis—the so-called Wassermann Reaction—which enables both past infection and the activity of the process of the disease to be ascertained. In addition he investigated the problem of a cure for cancer and collaborated with P. Ehrlich in introducing the diphtheria serum into practice. In later years Wassermann sought to obtain a sero-diagnosis of active tuberculosis; as to the practical utility of the latter as a reliable diagnosis, however, there is still a considerable divergence of views. He died in Berlin March 15 1925.

His works include: "Allgemeine Einleitung zur Lehre von den Infektionskrankheiten" in Ebstein and Schwalbe's *Handbuch der praktischen medizin: Influenza, Immunität und Serumtherapie und Hämolysine, Zytotoxine und Präzipitine* (1910).

**WASSERMANN, JAKOB** (1873- ), German writer, was born at Fürth, Bavaria, March 10 1873, the son of a small merchant. After an unhappy youth spent in wandering and poverty he settled in Austria, and it is about Austria and Austrians that he writes. His literary life, as he himself has said, began "when realism and naturalism were rampant" but he remained a

solitary figure owing allegiance to no school. His first novel *Die Juden von Zirndorf* was published in 1897, but it was *Die Geschichte der jungen Renate Fuchs* (1900) which first brought him fame. Many of his works have been translated into other languages but *Christian Wahnschaffe* (1919), published in America as *The World's Illusion* (1920), first made him known to the English-speaking world. Other translations into English followed: *Gold* (1920) *Faber, or the Lost Years* (1925). Some of his novels were collected under the title of *Der Wendekreis* (1920-2); his other works include *Das Gansemännchen*, *Casper Hauser* (1908), and an autobiography, *Mein Weg als Deutscher und Jude* (1921).

**WATER, PURIFICATION OF** (see 28.404).—Great changes have occurred in waterworks procedures since 1910. They began with the successful chlorination of the Lincoln water supply in 1905, consequent upon the typhoid epidemic there (about 50,000 inhabitants, over 1,000 cases of typhoid fever and 100 deaths).

**Chlorination.**—In the United States and Canada chlorination, for some years past, has been the rule, not the exception. In England, progress has been much slower, but the World War greatly altered things, thanks to the initiative of men like Horrocks and Sims Woodhead. Further, the bold step taken by the Metropolitan Water Board in chlorinating so huge a volume of water as over 100,000,000 gal. a day proved a great incentive to further investigation of this tremendous asset in the work of water purification.

The "chlorinators" plead that inasmuch as they destroy practically all the non-sporing bacteria of intestinal origin they incidentally kill all the microbes associated with epidemic water-borne disease. It is a bold claim, but apparently sound on the basis of current knowledge. The "anti-chlorinators" urge that a "doped" water is *prima facie* open to condemnation, and assert that there have been conspicuous failures in the chlorination processes in the past due to break-downs in the plant, or to dangerous compromises between doses sufficient to sterilise the water and yet small enough to avoid taste troubles. They further claim that natural processes (e.g., storage and slow sand filtration) remove at least 98% of the total number of bacteria in the original water of whatever sort they may be, and that prolonged experience has shown that this is an absolute protection from the diseases associated with the ingestion of impure water.

A third school claims that all purification processes are merely a retrograde movement—that safety lies alone in choosing virgin, uncontaminated sources of water supply, requiring no sort of purification. It is possible to sympathise strongly with this exalted attitude of mind, but practically we must face, to an increasing extent, the necessity of rendering impure waters safe for domestic use. As regards the "chlorinators" and the "anti-chlorinators," there is much to be said on both sides, and each case should be judged on its own merits. Chlorination is an exceedingly cheap process; less than one shilling per 1,000,000 gal. of water treated may suffice. It is disputed how the chlorine acts. Some say it has merely an oxidation effect, others claim that it has an intrinsic bactericidal action.<sup>1</sup> The dose is usually from 0.25 to 0.5 of available chlorine per 1,000,000 (2.5 to 5 lb. of chlorine per 1,000,000 gallons). The time required for sterilisation varies according to the dose and the quality of the water. A few minutes may suffice, but one to five hours, or even longer in certain cases, should be aimed at.

**Administration.**—The chlorine can be administered as a soluble hypochlorite (e.g., alkaline sodium hypochlorite), or as a solution of bleaching powder (chloride of lime), or as a solution made from the gas liquefied and liberated from metal cylinders. The latter process is now most extensively used, and there are some highly ingenious forms of apparatus for measuring accurately the gas as it flows from the cylinders through the chlorine apparatus on its way to the vessels or towers used for its final solution. Whatever method is adopted, it is highly important that the mixture of the chlorine and the water to be treated should be rapid and complete.

**Successes.**—The success of the treatment is determined by the destruction of *B. coli*, a non-sporing excremental microbe,

slightly more hardy than the typhoid bacillus and the cholera vibrio. It is also gauged by the circumstance that there are places where the incidence of water-borne diseases has been modified to a most gratifying extent since, and apparently as a result of, the introduction of chlorination processes.

**Taste Objections.**—Taste troubles have been a most serious factor in the problem. Frequently, in consequence, the dose has been reduced below the limits of safe sterilisation. Recently, however, knowledge has increased by leaps and bounds. It is now known that the presence of certain bodies (e.g., phenoloid substances) in excessively minute amount (less than 1 in 1,000 millions) may be the root of the trouble.<sup>2</sup> These impurities may arise from atmospheric contaminations, or be conveyed by liquid pollutions (e.g., washings from roads, etc.). Fortunately, valuable remedies (taste preventers) have been found, e.g., potassium permanganate and aminonia (dose about 0.2 per 1,000,000 the latter in terms of nitrogen). Even the organic matter, naturally present in waters, is a taste preventer, or "remover" of real value.<sup>3</sup> There is no reliable indication that chlorinated water has any deleterious effect on man, the lower animals, fish-life or horticultural operations. On the whole, the same may be said as regards its alleged injurious effect on metals. Chlorination is a factor of great importance in water purification, although this admission may be coloured with certain cautious limitations. It can increase the margin of safety and can bring almost any water to any pitch of epidemiological perfection required. In the language of "the man in the street," chlorine, in doses of 0.25 to 0.5 per 1,000,000, can render dangerous waters safe without giving them (at all events in conjunction with taste removers) any unpleasant taste, or conferring on them any undesirable characteristics. Beyond all question, chlorination has come to stay, although it may be wise to regard it as a most valuable adjunct to other purification processes rather than as an absolute panacea.

**Excess Lime Process.**—In 1912 a new method of purification called the excess lime process was described.<sup>4</sup> In softening waters lime is added in amount equal to, or just short of, what is necessary to combine with the dissolved carbonic acid in the water and with the bicarbonates. Carbonate of lime is formed, which, being practically insoluble, is thrown down as a precipitate. This mechanically purifies the water to a considerable extent, but does not produce a true bactericidal effect. In the excess lime method slightly more lime is added, so as to leave the water caustically alkaline, and this produces a marked bactericidal action. The amount of excess necessary depends on the duration of contact and the amount of impurities in the water, but one part of lime (as CaO) per 100,000 parts of water is usually sufficient.

The following quotation<sup>5</sup> may serve to illustrate the usefulness of the excess lime method:—

... the experiments carried out by us during the last two years at the Langford experimental station of the Southend Water Co., using water from two comparatively small rivers, show that by acting on Sir A. Houston's suggestion to use excess lime better results can be obtained than by the use of chlorine, since chlorine does not remove any of the organic matter in solution, whereas the excess lime will remove at least 50% of this. Waters, therefore, which a few years ago would have been considered quite unsuitable for a supply, and which no system of purification then known would have rendered safe, can now be utilised.

The method proved highly successful (1917) at Accra (Gold Coast Colony) in dealing with an impure swamp water used for water works purposes. Its successful use in 1913 enabled Aberdeen<sup>6</sup> to decide on the retention of the River Dee as a source of water supply, thus saving over £100,000 on alternative schemes. In 1914 it was shown at Sunbury that the raw River Thames could be purified to a wonderful extent.<sup>7</sup> For example, the ten worst samples of the river water and of the outlet from the first tank gave, on the average, colour estimations of 155 and 37 respectively, a reduction of 76%. *B. coli* was found to be absent from 10,000 c.c. of the treated water, on ten separate days.

The method has disadvantages: for example, the cost, the difficulties attendant upon the neutralisation of the excess of

caustic alkalinity and the problem of disposing of lime sludge in the case of hard waters. On the other hand, the advantages are considerable. Questions of taste are eliminated. Hard waters may be softened and soft waters hardened by the process. Hard impure waters are not only softened and rendered safe bacteriologically but improved greatly, as judged by physical and chemical standards.

**Water Tests.**—The physical, chemical and bacteriological tests used in the examination of waters have not altered very materially during recent years. Physically, observations are made of the colour (using a colour meter), turbidity (gravimetrically, or with some form of turbidimeter) and opacity (as shown, for example, by passing a beam of light through the water), etc. Chemically, the chief tests are still for ammoniacal, albuminoid and oxidised nitrogen, chlorides, oxygen absorbed from permanganate, hardness, etc., although new tests, like the determination of the hydrogen-ion concentration, are being used extensively. Bacteriologically, the number of bacteria (especially at 37° C.) and the *B. coli* test still hold the field. In connection with the latter test, a vast amount of work has been done, but we are still uncertain what significance should be attached to the various races of *B. coli* encountered in water analyses. The tendency is to insist on the possession of, say, two positive attributes (lactose+indol+) which characterise human faecal microbes and then judge the matter on a *quantitative* basis. On the whole, the attempts to differentiate between *B. coli* of human intestinal origin and those derived from the lower animals, fish and birds have been most disappointing. The modern teaching is that as it is economically possible, by adequate purification processes, to eliminate (or nearly so) all "lactose+indol+*B. coli*," this standard should always be aimed at. Speaking generally, nearly all are agreed that there should be no *B. coli* of the kind referred to in 100 c.c. of water in more than half of the samples examined.

**Results.**—The interpretation of results has altered considerably during recent years, especially in those cases where chlorination is practised. The tendency is rather in the direction of condoning certain imperfections of quality (e.g., the amount of organic matter present) provided that *B. coli* is killed. It is considered that if *B. coli* is destroyed the occurrence of epidemic water-borne diseases is impossible and that therefore other inferential indices of safety lose much of their significance. But those who cling to past traditions regard chlorination as a short cut to apparent rather than real purity.

**Natural Methods.**—These methods of purification have not been neglected of late years. The value of storage is being increasingly recognised. The three factors making for safety are equalisation, sedimentation and devitalisation. By equalisation is meant the dilution and averaging of any sudden access of pollutions to the water "feeding" a storage reservoir. Sedimentation means the settling out of solid impurities. Devitalisation implies the gradual extinction of undesirable bacteria under the conditions of storage which are unfavourable to the continued vitality of pathogenic microbes. Nature's method of purification has certain disadvantages. Just as some things die, so do others multiply, sometimes with embarrassing results. There are the diatoms, the protozoa, green and blue growths, etc. Some of these growths give rise to taste troubles (e.g., tabellaria, synura, uroglena, etc.); others exercise a serious blocking or choking effect on sand filtration processes (e.g., asterionella, synedra, cyclotella, fragilaria, etc.). Copper sulphate (in doses of 0.1 to 1.0 per 1,000,000; 1 to 10 lb. per 1,000,000 gal.) has been proved to be a valuable algicidal agent. The smaller doses have no injurious action on fish, but with the maximum doses great care must be exercised, especially in the case of trout.

**Filters.**—A new and interesting development is the suggestion that rapid (mechanical) filters should be used to remove nearly all the suspended matters (including algal and other growths) from water, and worked at the very rapid rate of 100–200 gal. per sq. ft. per hour. In order to cover the additional cost involved it is hoped that it may be feasible to work slow sand

filters at six instead of two gal. per sq. ft. per hour as a final filtration process. The underlying idea is that slow sand filters might be worked considerably faster than is usual if rapid filters were used antecedently to remove the bulk of the suspended matters. Those who favour these departures usually advocate chlorination as an additional safeguard, or, at all events, as a stand-by measure.

**WATSON, JOHN BROADUS** (1878– ), American psychologist, was born at Greenville, S. C., Jan. 9 1878. He graduated at Furman University (A.M. 1900), continuing his studies at the University of Chicago (Ph.D., 1903). After serving as assistant and instructor in experimental psychology at the University of Chicago, he was appointed professor of experimental and comparative psychology at Johns Hopkins University in 1908, becoming also director of the psychological laboratory there. He became known as the leading exponent of behaviourism. In 1917 he served as major in the aviation section of the Signal Corps, U. S. Reserves, and with the A. E. F. He was editor of *The Psychological Review*, 1908–15; became joint editor of *The Journal of Animal Behavior* in 1910; and editor of *The Journal of Experimental Psychology* in 1915. See BEHAVIORISM.

Watson wrote *Animal Education* (1903); *Behavior—An Introduction to Comparative Psychology* (1914); *Homing and Related Activities of Birds* (1915); *Suggestions of Modern Scientists Concerning Education* (1917); *Psychology* (1919); and *Behaviorism* (1925).

**WATSON, JOHN CHRISTIAN** (1867– ), Australian politician, was born at Valparaiso, Chile, April 9 1867, when his parents were on their way as emigrants to Australasia. He was educated at the public school of Oamaru, N. Z., and as a boy began work as a compositor. He also made an early entrance into politics, attaching himself to the Labour party, which came into prominence during the great strike of Australian dock and transport workers. He was president of the Sydney Trades and Labour Council in 1890. From 1894–1901 he was a member of the N.S.W. Legislature. In 1901 he was elected to the Commonwealth Parliament, and for a short time in 1904, on the resignation of Deakin, he led a Labour Ministry. He resigned after a few months, though he continued to lead the Labour party until 1908, when he retired from public life.

**WATTERSON, HENRY** (1840–1921), American journalist (see 28.418), was among the first to urge, in 1911, the nomination of Woodrow Wilson as Democratic candidate for President. In Aug. 1918, he retired from active editorship of the Louisville (Ky.) *Courier-Journal*, remaining "editor emeritus" till April 1919, when he severed all connection with the paper because of its support of the League of Nations. He died at Jacksonville,

Fla., Dec. 22 1921. He was the author of *Old London Town* (1910); *History of the Manhattan Club* (1915); and "*Marse Henry*"; an *Autobiography* (1919).

**WATTS-DUNTON, WALTER THEODORE** (1832-1914), British man of letters (see 28.422), died at Putney, London, June 6 1914.

**WEALTH AND INCOME** (see 28.437).—Before the World War fair progress had been made in different countries in the more accurate computation of annual income and in its capitalisation on sound lines in order to arrive at aggregate wealth. But the methods varied very widely. Much depended on the degree of civilisation which had been attained, on the methods of taxation in force, and on the extent to which statistical measurement had been pursued; and even if the War had not intervened it would still have been impossible to get a complete picture of the total income or wealth of the world. Such figures as have been offered are rich chiefly in speculation, and, as the following analysis of fundamental principles will show, they depend largely on the methods of investigation which have been adopted.

### I. GENERAL CONSIDERATIONS

In some respects the World War assisted research in this wide field of finance; in others it added substantially to its difficulty. Everywhere (including countries nominally neutral in the strife) public debt was largely increased. Acute disease, usually described as inflation, overtook the currency of the nations. Valuation of almost anything, save within narrow limits, became hazardous; and the stress laid on monetary or nominal income, as opposed to real income (in the sense of purchasing power), was in itself a complication which rendered valid comparison almost impossible. For these reasons it would be idle to attempt any review of world income and wealth in the period since 1910—the central feature of which must be the virtual revolution brought about by War conditions—without preliminary notice of certain basic principles. These principles throw important light on this form of public financial computation and comparison.

The summary presented to the Royal Statistical Society by Sir Josiah Stamp in May 1919 endeavoured to present the position as in 1914. As he himself explained, it was a first attempt and necessarily elementary in character, but since then there has been no serious challenge of its main conclusions. In all problems of the kind there is the constant danger of partisan estimate. Apparently competent authorities had argued that the wealth of the United Kingdom in 1914 was approximately £10,000,000,000; others had placed it as high as £24,000,000,000. Much depends on the use to which estimates of the national wealth are put. They are available as tests of progress, affording comparison with different years; they show the accumulation of capital, the distribution of wealth, and the effect of changes in the rate of interest or in the value of money. They may be employed to test the relative prosperity of resources of different nations; or for comparisons of income with capital and property; or to reveal the distribution of wealth according to individual fortunes, with the changes in that distribution; or to facilitate the consideration of the applicability and probable yield of specific schemes of impost or taxation such as a capital levy; or for the purpose of dealing with questions relating to war indemnities, in which case even simple inquiry has shown that wealth or income at any given moment is not the sole test of ability to pay indemnity or make reparation; it is at best only a partial test.

In such investigation there are innumerable intricate and highly technical problems. The mass of recent work in different countries has emphasised the difficulty of careful and authoritative estimate. It is not easy to secure adjustment as at a uniform date, 1914; in addition to the disturbing effects of war there is the abiding problem of the comparability of like subject matter. Reliable as it might be for broad purposes in 1914, it has since been subject to great variation, and the range of error at the present time is probably considerable. The wealth of a tribal community is not readily comparable with that of a people advanced in civilisation, and although the illustration may be regarded as extreme the ramifications of war disturbance have

been so great that the remark is still applicable in certain parts of the world.

*Public Debt.*—But the substantial consideration is present-day effort to measure the aggregate of gross personal wealth and to make strictly accurate allowance for public debt and its consequent burden of taxation. For even if all the debt is held internally, neglect of its influence, viewed as a capital obligation and the cause of heavy annual taxation, may lead to ridiculous results. Although the debt is held within the State, it has been described as a concealed liability, through taxation, on income and capital generally. In this matter the usual method is to count as wealth the individual holdings in Government stock and to deduct the debt as a mortgage on the property held by the State or the collective community. There is not, however, uniform practice in different countries. The magnitude of the problem which is raised by this apparently simple principle may be gathered from the following comparison of the pre-War and post-War public debt of the leading nations.

*Public Debt by Countries*

| Country                   | 1913<br>Pre-War        | Post-War |                        |
|---------------------------|------------------------|----------|------------------------|
|                           |                        | Year     | Debt                   |
|                           | £,000,000's<br>omitted |          | £,000,000's<br>omitted |
| <i>The British Empire</i> |                        |          |                        |

The various currencies have been converted into sterling at par of exchange, e.g., \$4.867 = £1, or 25.225 fr. = £1.

*Definition of National Wealth.*—These statistics must be read in conjunction with the vital fact that the deduction of debt from State property will often give a minus quantity. In such questions, there is still much confusion of thought. The wealth of a country may mean either the value of objects within its boundaries or the wealth of its inhabitants including foreign possessions, but excluding wealth within the country held by people abroad. This confusion was very well illustrated in the prolonged discussion of the taxable capacity of Ireland; it constantly recurs in kindred problems at the present day, notably in the effort to arrive at working arrangements to avoid double taxation. Again,

wealth in private hands is not easily defined. In the various shades of ownership Sir Josiah Stamp has summarised absolute personal disposition of the whole value, trust interests, collective ownership with only potential specific allocation to individuals, collective ownership without the possibility of individual allocation, communal wealth such as city and local property, and national property including even the instruments of defence. Much controversy still attends the inclusion or the non-inclusion of the valuation of domestic service by members of families. And there are still many countries in which stock or produce occupies a large place in total valuation; in post-War fluctuation values have varied very widely at short intervals, rendering all the more difficult every effort to estimate aggregate wealth.

*Estimates Based on Taxation.*—It is important to notice also the various methods of computing wealth and income. Many of them are necessarily based on data arising from taxation of income, especially collective taxation or taxation at the source. The immediate advantage of this system is the comprehensive result; on the other hand there is liability to error owing to tax evasion, omissions from the scheme of tax, and difference of practice in the basis of capitalisation, that is, in the number of years' purchase adopted. Many estimates rely on the taxation of income on individual returns. But there also arise the tendency to considerable evasion, the omission of all income held collectively, and the difficulty of determining the ratio of income to capital on the average, the last point making capitalisation no easy task.

Many estimates proceed on the basis of data arising from the annual taxation of capital. It varies on particular classes of property; and these particulars supply only a part of the whole capital valuation. Other estimates have relied on material arising through the taxation of capital at irregular periods, such as the statistics of estates passing at death and chargeable with death duties. This method has always provoked controversy as to the multiplier which should be employed in order to indicate aggregate value. Within recent years the multiplier has undoubtedly been greatly improved, but it is still open to doubt on certain essential points. In his review of the private wealth of Australia, Mr. G. H. Knibbs described two methods. Under the first there was determination of the average interval of time between the passing of estates to the successors in title, generally called the devolution-interval method; under the second there was ascertainment of the average rate of the passing of estates during any period under review, commonly called the devolution-rate method. Further difficulties in the use of property returns for such a purpose include defects in administration, the evasion of a particular duty the statistics of which are being used, the effect of *inter vivos* gifts in keeping a certain proportion of wealth from passing with the frequency of ordinary intervals for estates as a whole, legal points affecting estate duties, the fact that vital statistics are constantly changing, the problems which are raised by the method compiling the vital statistics themselves, and the actual growth of wealth in the period under review.

*The Census System.*—Of other methods, the inventory system aims at valuation in the aggregate of each form in which wealth is embodied without regard to ownership by individuals, companies or others. It is often called the objective method. To a large extent, however, it depends for success on the existence of statistical material compiled for other purposes, e.g., the statistics of imports and exports, local government taxation, the valuation of mineral and other resources and kindred material. The chief defects of this method are probably the impossibility of testing how far the ownership of the wealth is within the country or not, the difficulty of determining whether all forms of wealth have been included, the risk of overlapping, as in stocks and shares duplicated with real property owned by companies, the divorce from all tests of profit-earning capacity, and the task, where averages are employed as factors, of accurately determining them.

In some countries, notably France, Germany, Spain, Australia and the Argentine, the inventory method has been applied by single observers; in the United States it summarises the collected results of many investigators, and is called a census. In

the census method proper a statement is taken from each individual declaring the whole of his wealth and income. It depends very much on the completeness and efficiency of the tax in question. The British method of depending largely on taxation at the source (that is, by deduction before dividends or other payments are made to the recipients) is clearly very much more reliable than the tax system of other countries destitute of that feature. The occupational census method is used for dealing with wage-earning classes and smaller incomes to which ordinary income tax statistics are not applicable. In the net output or census of production method the total value of work done or goods produced in a year is determined; the value of the raw materials is deducted; and the added value is taken as the fund which forms the income of the people. Broadly speaking, in the British census of production in 1907 the net output was the gross output (selling value) less the cost of the materials used. The new census of production in which Great Britain is now engaged should be of substantial value in the next effort to estimate both aggregate income and aggregate wealth (*see PRODUCTION, CENSUS OF*).

## II. THE WEALTH OF VARIOUS COUNTRIES

With these fundamental principles in mind it is easier to follow such statistics of the wealth and income of the leading countries of the past 15 years as are available; their incomplete, and often irreconcilable character is already fully explained.

*Great Britain and the United States.*—Bound together in a debt settlement covering the next 60 years, and closely associated in many of the post-War financial operations, it may be convenient to group Great Britain and the United States of America. Before the Royal Statistical Society in 1914 Mr. Edgar Crammond estimated British capital wealth at £16,472 millions; in *British Incomes and Property*, published in 1916, Sir Josiah Stamp put the aggregate amount in 1914 at £14,319 millions. Estimates of income are generally made up of the income of the income-tax paying classes, compiled from the tax statistics, the income of the wage-earning classes, and the income of others below the income-tax limit which was the subject of special inquiry by the British Association some years ago. For 1911 Sir Josiah Stamp put British income at £2,090 millions, of which almost exactly half was attributable to wages and small salaries, £926 millions to incomes over £160, and the rest derived from miscellaneous sources. On a similar basis the figure was £2,250 millions in 1913-4. That figure, rather than the £2,400 millions which was frequently in debate, was accepted in authoritative circles. Since the World War estimates have varied enormously; in 1925 (in the absence of much of the reliable material for such an investigation, they ranged from £2,500 millions to nearly £4,000 millions, the latter being clearly extravagant.

For more than three-quarters of a century America has relied on the census conducted by the Washington Bureau; but Sir Josiah Stamp has pointed out that, although called a census, it is more strictly an inventory, "as far as possible on a tax basis, for it does not require individual statements of personal wealth, but delegates the construction of the inventory to a large number of officials for different areas, under careful, uniform instructions." Expressed in sterling, the total national wealth of the United States was, in 1912, put at £38,577,000,000; the population was rather more than 95,000,000; and the national wealth per head of population £404. Most of the leading authorities on the income of the United States have urged the practical impossibility of estimating with more than general accuracy. Dr. King thought that it might be attempted either by test of the consumption of the people, or of the production of the nation. The second method was probably preferable, for information regarding retail prices was scanty and unreliable, and in such "consumption" which takes place for purposes of further production there was the substantial difficulty of duplication. But in 1910 the total money income was placed at £6,272 millions, £68 per capita, £307 per family, or £5,861 millions on the basis of net goods consumed.

Mr. David Friday, dealing with the taxable increase of the United States, has estimated the income of the United States as

a whole for 1917 and 1918, and also as subject to excess profits and income taxation. By the net product method his figure was £13,400 millions. The Hon. A. C. Miller, of the Federal Reserve Board, estimated the income for 1917 at more than £10,000 millions. Other authorities have put it as high as £14,000 millions, chiefly by adopting the 1910 basis of Dr. King, adding 31% for increased production and 71% for increase in prices. In this work the subject is discussed by Professor T. N. Carver. (*See UNITED STATES; Finance and Wealth*.)

*Germany.*—In the case of the German Empire Dr. Helfferich, director of the Deutsche Bank, published in 1913 an analysis of aggregate income and capital. The total income of personal taxpayers and persons exempt appeared to be £1,092 millions, compared with £1,058 millions in 1911. Statistics later than 1913 should be used with caution, but for that year Dr. Helfferich made an increase which brought the aggregate income to £2,105 millions. Several of the leading British authorities contend that there may be 5% error in the estimate of tax-free incomes either way, and that the 10% addition for evasion is a minimum figure which should probably be increased to 20 per cent or thereabouts.

Taking the statistics about the property tax in Prussia as a basis in capital valuation Dr. Helfferich made a 20% allowance for taxable property omitted, analysed the position of private property legally exempted, dealt with the position of more than 5,500,000 owners, made certain allowances for furniture, utensils and clothing, and for property in impersonal ownership, and finally arrived at an aggregate of £7,850 millions. On the assumption of a like basis for the other States he concluded that the aggregate for the German Empire was probably £12,750 millions, to which he made additions for State railways, profit-making undertakings of State and municipalities, schools, churches, parks and similar unproductive property, all of which, after deduction of public debts, gave a grand net total of £13,950 millions for 1911. But this total was checked by reference to fire insurance statistics for that year, which gave a total of more than £16,000 millions, and from further analysis of tax method and fire insurance method a final figure of £14,150 millions was derived. This may be taken therefore, as a fair estimate.

*France.*—Comprehensive treatment of the corresponding problem in France by M. Rene Pupin, published in 1916, recognised, as regards income, four methods of computation. These were, a coefficient giving a constant relation between rental values of premises and the incomes of their inhabitants; the reckoning of income from the amount of taxes paid; the classification of trades

by Thery for the same year. A later estimate by another authority, but dealing with 1913, was almost exactly £12,000 millions or approximately £300 per head. The following ten years probably saw an increase in this figure, in spite of the tremendous losses caused by the World War.

*Italy.*—Italy is rich in computations of aggregate wealth, but weak in estimates of annual income. Two of the leading authorities estimated that in 1914 the aggregate wealth of the Italian people was £4,484 millions and £4,000 millions respectively; Gini certainly took very great pains by local inquiry in each of the areas to ascertain the extent of the deficient valuation of land and buildings, a problem which, as most of the critics have contended, dominates the estimate. The weakness of Italian tax data makes it practically impossible to offer reliable estimate of the national income of Italy, nor is much assistance to be derived from the occupational census. In his survey of the direct costs of the World War Bogart adopted a current estimate of £800,000,000.

*Other Countries.*—The statistical material of other countries varies very greatly, both in scope and reliability, but the following figures of annual income and aggregate wealth, together with the years to which they apply, are offered from such material as is available:—

| Country   | Year | Total Income<br>Million £<br>(approx.) | Total Wealth<br>Million £<br>(approx.) |
|-----------|------|----------------------------------------|----------------------------------------|
| Spain     | 1913 | 228                                    | 2940                                   |
| Holland   | 1910 |                                        | 1050                                   |
| Sweden    | 1913 |                                        | 777                                    |
| Belgium   | 1913 |                                        | 1181                                   |
| Norway    | 1911 |                                        | 184                                    |
| Australia | 1915 | 257                                    | 1643                                   |
| Canada    | 1915 |                                        | 2285                                   |
| Japan     | 1914 | 325                                    | 2400                                   |
| Argentina | 1914 |                                        | 2400                                   |

War conditions which, as already indicated, interrupted the normal work of neutrals as well as belligerents have in many cases prevented the compilation of later and probably more accurate statistics. There are, however, certain broad general conclusions. The United States would appear to have a considerable absolute lead in real wealth, and in the rapidity of its increase; the difference between the United Kingdom and Germany has probably been exaggerated; the effects of the thrift of the French people are readily traceable; and Japan has made remarkable progress, allowing, however, for the fact that over

*National Wealth of Certain Countries*

| Country       | Year | National wealth        | In sterling at par | In sterling at current rate of exchange in May 1926 | Current rate of exchange in May 1926 |
|---------------|------|------------------------|--------------------|-----------------------------------------------------|--------------------------------------|
| Great Britain | 1923 | £ 20,000 millions      |                    | £20,000 millions                                    |                                      |
| Canada        | 1923 | \$ 25,000 millions     | £ 5,100 millions   | £ 5,400 millions                                    | \$4.465 = £1                         |

and callings according to local areas, with a coefficient of productivity; and "successive approximations" under which an effort is made to reach the net income or annual produce from capital and work at the disposal of the French people after paying all the general expenses of their enterprises. In the period immediately preceding the outbreak of the World War Pupin's total of individual incomes in France was £1,280 millions, but to that sum substantial additions had to be made for the undistributed profits of companies, the subsistence of nearly 5,000,000 persons living on the holdings of their farms, together with land belonging to the State and other territorial jurisdictions. For 1911 Pupin's estimate upon the direct method of the capital resources of the French people was £11,420 millions, compared with £11,380 as estimated by Peret for 1912 and £12,100 millions

60% of her population is engaged in agriculture and lives on an amount per head which would be regarded as impossible in Europe. To complete the picture in such form as is possible, there should be offered the latest estimate of the national wealth of some of the chief countries. Six of these are taken for our purpose, namely Great Britain, United States, France, Italy, Canada and India.

*Cost of the War.*—By the side of these figures must be set the cost of the World War. The statistics on the following page deal with the six fiscal years 1914-9 inclusive; they do not cover the total outlay of the War period, but they are substantial representation of gross and net cost, a problem which is in process of constant adjustment as inter-Allied debt arrangements are completed:—

Cost of the War<sup>1</sup>

*The Cost of the War—Entire period covering the six fiscal years 1914 to 1919 inclusive.*

(In pounds—000,000 omitted.)

| Nations                             | Total expenditure | Gross cost | Net cost |

**WEAVER, JAMES BAIRD** (1833–1912), American lawyer and political leader (see 28.439), died at Des Moines, Ia., Feb. 6 1912.

**WEAVING:** see TEXTILE MACHINERY.

**WEBB, SIR ASTON** (1849– ), British architect, son of Edward Webb, engraver and painter, was born in London May 22 1849. His advance in the architectural profession was rapid, and he was elected president of the Architectural Association in 1884, and of the Royal Institute of British Architects in 1902. One of his earliest commissions was the restoration of the beautiful church, St. Bartholomew's, Smithfield, London. Among many other public works of importance carried out by Sir Aston Webb, who was knighted in 1904 and made K.C.V.O. in 1914, were the building of the new front of Buckingham Palace, and the design of the architectural settings for the Queen Victoria Memorial there, as also the imposing Admiralty Arch at the other end of the Mall, London. He was also responsible for the completion of the Victoria and Albert Museum, the Royal College of Science and other institutions at South Kensington. In Jan. 1919 he was elected president of the Royal Academy, being the second architect chosen to fill that post. He resigned the presidency owing to ill-health in 1925; when he was made G.C.V.O.

**WEBB, SIDNEY** (1859– ), British writer and politician (see 28.455), from 1909 played, with his wife Beatrice, an increasingly important part in moulding the opinion of British Labour and supplying it with an intellectual armoury. Mrs. Webb was a member of the royal commission on the Poor Laws, whose Minority Report, issued in 1909, was the work of herself and her husband. They were concerned in the founding of the weekly *New Statesman* in 1913, and for some time before that had been busily promoting the development of the London School of Economics and Political Science, a department of the University of London where Mr. Webb was professor of public

administration. From 1915–25, he was a member of the Executive of the Labour party, for which he wrote *Labour and the New Social Order*. In 1918, he stood unsuccessfully for London University as a parliamentary candidate; in 1922, after an extraordinary educational campaign by himself and Mrs. Webb, he was returned as M.P. for a Durham mining constituency, Seaham Harbour, with an immense majority, which was maintained at subsequent elections. In 1919, Mr. Webb was a member of the royal commission on coal mines, and put before it a complete plan for the nationalisation of the industry; in the same year he served on the committee on trusts, set up under the Profiteering Acts. His inclusion in the first Labour Govt. was a matter of course; but his presidency of the Board of Trade, an office which he held in 1922–23, was not marked by any striking innovations.

Among the publications of Mr. and Mrs. Webb after 1906, the following were the most important:—*English Local Government: The Manor and the Borough* (1908); *The Break-up of the Poor Law and The Public Organization of the Labour Market* (1909); *English Poor Law Policy* (1910); *The State and the Doctor* (1910); *The Story of the King's Highway* (1913); *The History of Trade Unionism*, new and revised ed. (1920); *A Constitution for the Socialist Commonwealth of Great Britain* (1920) and *The Consumers' Co-operative Movement* (1921), and *The Decay of Capitalist Civilization* (1921) in which, after being active members of the Labour and Socialist movement for over 30 years they for the first time frame an indictment of the capitalist system. Mr. Webb also published *Grants in Aid* (1911); *How to Pay for the War* (1916); *The Works Manager To-day* (1917); and *The Story of the Durham Miners* (1921). In 1926 Mrs. Sidney Webb, who before her marriage was Miss Beatrice Potter, issued an autobiographical work, *My Apprenticeship*.

**WEBER, MAX** (1864–1920), German economist, was born at Erfurt April 21 1864, and studied jurisprudence at Heidelberg, Strasbourg, Berlin and Göttingen. He took up the teaching of Roman law and commercial law in Berlin in 1892, and became professor of commercial law and German law at the university of that city in the following year. In 1894 he was appointed professor of national economy at Freiburg (Baden). Three years later he was transferred to Heidelberg, but resigned his appointment on grounds of ill-health in 1903, and lived in Heidelberg as a private individual until the revolution of 1918. He then accepted an invitation from the university of Munich. During the ardent political disturbances of this period he proved himself in lectures and writings a most penetrating, practical and vigorous critic, whose opinion was backed by encyclopaedic knowledge. He died in Munich June 14 1920. Weber first became known for his works on Roman and then German agrarian history. His first important work was *Die römische Agrargeschichte in ihrer Bedeutung für das Staats- und Privatrecht* (1891). Later he occupied himself principally with sociology and social philosophy, as in *Die sozialen Gründe des Untergangs der antiken Kultur* (1895).

Other works are *The rural Community*, lecture delivered before the international Congress in St. Louis (1904); *Russlands Uebergang zum Scheinkonstitutionalismus* (1906). The following works were published after his death: *Gesammelte Aufsätze zur Religionssoziologie* (1920, 1921); *Gesammelte politische Schriften*, and *Gesammelte Aufsätze zur Wissenschaftslehre* (1922); *Wirtschaft und Gesellschaft* (1921); *Wirtschaftsgeschichte* (1923); *Gesammelte Aufsätze zur Soziologie und Wirtschafts-Geschichte* (1924); *Gesammelte Aufsätze zur Soziologie und Sozialpolitik* (1924).

**WEDEKIND, FRANK** (1864–1918), German dramatist, was born in Hanover July 24 1864, his father being a doctor. He was educated at his father's château at Lenzburg in Switzerland, and in 1883 took up journalism. Afterwards he became an advertising manager and then, in 1890, secretary of a circus in Paris and London. In 1896 he contributed political articles to *Simplicissimus* and in the following year he set up as an actor and producer in Leipzig, moving in 1898 to Munich. He acted in his own dramas with his wife, and a company on tour, which made yearly visits to Berlin and performed at the Deutsches Theatre. Wedekind's dramatic works deal mainly with erotic problems, sharp criticism being directed against middle class society. They include *Kammersänger* (1900); *Büchse der Pandora* (1904); *Hidalla* (1906); *Oaha* (1908), *Schloss Wetterstein*, and *Franziska* (1912).

The scenes are generally symbolic and the characters are representative of types rather than individuals. Wedekind also wrote poetry, novels, *Mine-Haha* (1906), etc., and essays. He died in Munich March 4 1918. See A. Kutschner, *Frank Wedekind* (1924).

**WEDMORE, SIR FREDERICK** (1844-1921), British art critic and man of letters (see 28.466), died at Sevenoaks, Kent, Feb. 25 1921. He was knighted in 1912. His later publications include *Memories* (1912), *Painters and Painting* (1913) and a novel, *Brenda Walks On* (1916).

**WEEKS, JOHN WINGATE** (1860-1926), American public official, was born at Lancaster, N.H., April 11 1860. He graduated from the U.S. Naval Academy in 1881, served two years as midshipman, then resigned from the navy and became assistant land commissioner of the Florida Southern Railroad. In 1886 he helped to organise the banking and brokerage firm of Hornblower and Weeks, Boston, Mass., of which he was a member until 1912. In 1890 he joined the Mass. naval brigade, and during the Spanish-American War commanded the second division of the auxiliary U.S. naval force on the Atlantic coast. From 1894 to 1900 he was a member of the Mass. military advisory board and of the military board of examiners. After serving as alderman of Newton, Mass., he was elected mayor (1903-4). In 1905 he was chairman of the Mass. Republican state convention. During 1905-13 he was a member of the national House of Representatives and as a member of the committee on banking and currency took an active part in framing the Aldrich-Vreeland Currency Bill. In 1913 he entered the U.S. Senate, but was defeated for re-election in 1919. He was a member of the Senate committee on military affairs during the World War. In 1921 he entered the Cabinet of President Harding as Secretary of War. In this office he served also in the Cabinet of President Coolidge, but resigned on account of ill-health Oct. 12 1925. He died at his summer home, Lancaster, N.H., July 12 1926.

**WEI-HAI-WEI** (see 28.494), a territory with an area of about 288 sq. m. to the west of the Shantung peninsula leased to Great Britain by China under a convention of July 1 1898. The population is about 246 foreigners, including officials and naval and military detachments, and 154,146 Chinese. The question of the rendition of the territory to China arose at the Washington Conference, when Mr. (Lord) Balfour proposed to restore the district if it would facilitate the Sino-Japanese agreement in Shantung. He made a definite offer on Feb. 1 1922 after the announcement of the Agreement in Shantung to surrender the lease of Wei-Hai-Wei, subject to the territory remaining available as a summer resort for the British China squadron. In a letter addressed to the Chinese delegations on the following day it was suggested that a joint commission should be set up to study the question on the spot and arrange the details of the transfer. Provisional agreement was in fact reached on May 31 1923, under which the greater part of the British Govt. property was to be handed over to the Chinese Govt., who were asked in return to provide facilities for a trading and residential settlement and to leave certain buildings and an area of the harbour free for limited use by the British Admiralty. Objections were raised by the Chinese authorities to the details, and up to the end of 1925 no further steps had been taken in the matter. (See CHINA.)

**WEINER, LEO** (1885- ), Hungarian musical composer, was born in Budapest April 16 1885 and studied composition under Hans Koessler at the Royal High School of Music in that city, where he was subsequently (1907) appointed professor of composition, and later of chamber music. His works include the orchestral plays: *Serenade* (1906, awarded the Budapest Lipót-városi Kaszinó Prize), *Carnival*, *Scherzo* and accompanying music to a play by Michel Vörösmartzy entitled *Csongor és Tünde*. Chamber music: two string quartets (the second of which gained the Coolidge Prize in America, 1922), two sonatas for violin and pianoforte, and a ballad for clarinet and pianoforte (also for orchestra). Weiner's music shows great delicacy of feeling and a meticulous care for detail. His style is classical and he ignores both the romantics and the ultra-modern school.

**WEIR, WILLIAM DOUGLAS WEIR** 1ST BARON (1877- ), British politician and business man, was born May 12 1877, the son of James Weir of Over Courance, Dumfriesshire. His talents for business organisation were recognised by the Coalition Govt. during the World War, when he was appointed director of munitions for Ireland, a post which he held in 1915-6. In 1917-8 he was controller of aeronautical supplies and a member of the Air Board. In the same year (1918) he became director-general of aircraft production at the Ministry of Munitions, an appointment which he held in conjunction with a seat on the council of that department; and also (April-Dec.) Secretary of State and president of the Air Council. In 1919 he was appointed chairman of the advisory committee on civil aviation. Lord Weir was managing director of the engineering firm of G. & J. Weir, Ltd., Glasgow, which constructed the "Weir" steel houses, about which there was a good deal of controversy in 1925 and 1926. He received a knighthood in 1917 and in the following year was raised to the peerage and sworn of the privy council.

**WEISMANN, AUGUST** (1834-1914), German biologist (see 28.499), died at Freiburg-in-Baden Nov. 6 1914. His latest publications were an estimate of Darwin's work and *Die Selektionstheorie*, both published in 1909. See Ernst Gaupp, *August Weismann* (1917).

**WEISS, BERNHARD** (1827-1918), German theologian (see 28.499), died in Berlin Jan. 14 1918.

**WEKERLE, SANTOR** (1848-1921), Hungarian statesman, (see 28.500). During the World War he stood firm for union with Austria and took office as Prime Minister for the third time in Aug. 1917. In Oct. of the following year, after the fall of Fiume, he resigned. He died in Budapest Aug. 26 1921.

**WELDING** (see 28.500).—This article discusses electric welding and gas-torch welding. A third form of welding, thermit welding, is discussed in the article THERMIT.

## I. ELECTRIC WELDING

*Spot Welding.*—The important development known as spot welding is a modification of the Thomson process, peculiarly applicable to uniting overlapped sheets of metal by welded "spots" or localised areas of union of the sheets in place of riveting them. It leaves little or no projection or deformation on the outer surfaces of the sheets so united.

FIG. 1.—Spot Welder with electrodes (E).

FIG. 2.

The machine for such work is called a "spot welder," and usually has two electrodes arranged in a vertical line, one above the other. The electrodes consist of short, heavy, blunt copper bars, E E (fig. 1) (watercooled in the larger machines); the upper electrode E is made movable up and down under control of a manually operated pressure lever, L, or by a piston actuated by air or water pressure controlled by a valve. The opposed ends of the electrodes, which bear upon and form contact with the sheets to be united, are usually chamfered or given the form of frustums of shallow cones. This reduces resistance loss in the electrodes and adds to their rigidity and durability. The electrodes, as in other resistance welders, are made the terminals of

the heavy secondary circuit of a welding transformer, T, the usual single turn of large section. The current is large, but is delivered to the work at low voltage.

The weld which unites the sheets is a spot, usually round in form, confined in extent to the area covered by the ends of the electrodes. The opposed faces of the sheets are thus locally and quickly heated to welding temperature, and the pressure of the electrodes causes complete union; such welded spots are successively made at intervals over any extent of surface of the sheets as in riveting (see figs. 2 and 3). While spot welding has been

FIG. 3.—Two welded sheets

found to be best adapted to the union of overlapped sheets or edges of comparatively thin metal, plates of  $\frac{1}{2}$  in. or more in thickness may be spot-welded by heavy welders constructed for the purpose. In some of these, for mechanical and electrical reasons, two spot welds are made simultaneously by the same current passed in series through two spots covered by two pairs of opposed electrodes connected in series in the welding circuit.

**Projection Welding.**—Another form of welding, known as "projection" welding, resembles spot welding, differing therefrom, however, in the use of electrode faces which do not in themselves determine the welded area or spot, and in permitting the instantaneous union of plates or pieces at many parts of their surfaces. Raised spots or projections are formed on one or both pieces, which when brought together form the paths for current and consequent development of welding heat irrespective both of the other parts of the plates and of the electrode contact with the sheets. The contact covers a wide extent of the pieces to be welded, and serves to press them together as the projections between them become heated and softened.

**Roller Welding.**—In roller or line welding, for forming continuous lapped seams in sheet metal work, the overlapped edges of the sheets to be united are passed steadily between an upper copper roll with an edge of the width of seam weld desired, and a conducting mandrel, plate or similar copper roll forming the under electrode. The weld so formed is a line or strip of a width determined by the width of the contact surface of the welding roll. Thin steel tubes with lap welds are made by this method, and it has also found application in the construction of thin metal containers such as steel thermos bottles, the parts of which are united without solder.

**Flash Welding.**—By the Thomson resistance process welds are made by light contact of the pieces during heating, followed by quick application of heavy pressure to force the heated surfaces together. With iron and steel the method secures a very strong weld, and the heating is confined closely to the weld itself. Moreover, there is a saving of time and often of energy. The speed of output in resistance welding was at first limited by the comparatively restricted energy supply and the capacity of the electric welding machine to deliver it to the work. This was especially true of operations such as the longitudinal welding of a seam in making steel pipe. With the modern extension in electric supply from large stations and enlargement of the capacity of welding transformers, etc., rates of production several times that of early practice have been achieved, with a possibility of future increase. In one enterprise alone, making electrically welded steel tubing, a production of over 100,000,000 ft. a year, or about 20,000 m., has been reached.

**Percussion Welding.**—If an electric condenser of large capacity be discharged by wire terminals of relatively small section made to approach each other in line, the discharge occurs with a flash of light at or before actual contact, depending on their potential difference. With sufficient capacity of condenser the restricted areas of the opposed ends of the discharge wires are brought superficially for an instant to a high temperature, and if immediately pressed into firm contact will weld or unite. Modifications of this process tending to increase the range and scale of its application have been brought out.

**Electric Arc Welding.**—This process of fusion and union of metals in which an electric arc is the source of heat has now a wide extension. Many forms of arc-welded joint in steel structures have already been to a degree standardised. The arc terminal applied to the work (usually the negative electrode when direct current is used) is a wire or rod of mild steel, mounted in a suitable holder manipulated by the operator, upon whose skill the perfection of the work largely depends. These electrode wires ordinarily vary in diameter according to the scale of the work or current strength used, and range from  $\frac{3}{32}$  in. to  $\frac{1}{8}$  in. or more. As the welding wire is rapidly consumed in the operation of fusing a joint, etc., it is constantly fed forward. Automatic arc welders have been devised in which the arc separation is controlled automatically and the wire fed automatically from a reel. In operation the arc voltage may be from 10 to 20 volts and the current traversing the arc 80 to 200 amperes or more.

The welding is attended by much sputtering and projection of fused and superheated globules of iron from the end of the wire electrode toward the cooler and heavier masses of the work-pieces. In fact, the deposition of metal on the work is possibly due to a jet of iron vapour from the electrode wire, carrying fused iron globules as a result of explosive boiling of the iron. This action would be a natural consequence of the central area of the end of the electrode wire being at the highest temperature, as it loses heat by radiation less readily than the outer surface of the wire at the arc. This central area reaches a temperature of about the boiling point of iron. The temperature of the arc is so high that the surface of the work-pieces, however massive such pieces may be, is penetrated and fused so that the metal of the work is incorporated with that from the welding electrode wire. The welding may be regarded as a progressive filling or plastering action by condensed iron vapour and fused iron. The operation is facilitated by coating the electrode wire lightly with mineral films, such as lime, which probably act by furnishing volatile material which adds to the stability of the arc. Depending on the strength of current in the arc and the skill of the operator, from 1 lb. to 2 lb. of metal per hour may be deposited in effecting the welds. When plates of over  $\frac{1}{8}$  in. in thickness are to be butt welded they should be bevelled before abutting them, so that a groove of not less than 60° flare shall be provided, to be filled with the fused metal (see fig. 4). Where the plates meet at an angle, as in fig. 5, the fused metal is deposited either at *a* or *b*, or both.

FIGS. 4 and 5.—Welding Operations

Arc welding can be carried on even upon the under side of the work (such as a boiler or tank *in situ*). The actual rate at which seams can be made in arc welding naturally depends upon the thickness of the plates to be united, the kind of joint to be made and other conditions. With automatic machines on small work it may rise to about 2 ft. per min., while in heavy work by hand operation it may not exceed 2 in. per minute. Ordinary arc welds on steel may possess a tensile strength of as high as 50,000 lb. per sq. in., but arc welds under tension showed little elongation before fracture, and were consequently brittle on bending. This defect of arc welds in steel or iron has, however, been removed by recent inventions preventing absorption of deleterious substances and oxidation of the metal of the weld, which instead of being brittle becomes highly ductile as well as strong. Such improvements are the result of laboratory research work by one of our large industrial organisations. Cast iron is amenable to arc welding when proper precautions are taken. Likewise bronze or copper and its alloys may be welded, a favourable condition for which is preheating of the workpieces. In these welds

the carbon arc is employed, as it is found to favour the proper union of the weld metal with the other pieces.

Arc welding has usually been done by the use of direct current, and special dynamo generators are constructed for supplying the current, with regulating characteristics suitable to welding. The alternating-current arc is, however, adaptable to welding, provided the frequency is not too low. Arc welding is employed in the construction of tanks, and in caulking the seams of tanks which must retain oil or thin liquids without leak. It is much used for repair work. It is readily applicable to joining broken pieces and to replacing metal worn away in use, e.g., the restoration of rail surfaces of tramways *in situ*. It is generally less costly in application than the other forms of fusion welding, such as that by the use of oxygen blowpipe or thermit welding. The improvements which have been made point to a greatly extended application of arc work in the future; as in the construction of steel ships, pressure tanks and steam boilers without riveting.

(E. T.)

## II. GAS-TORCH WELDING

Gas-torch welding is variously known as "autogenous" welding, "oxy-acetylene blowpipe" welding, "hot gas flame" welding, "fusion" welding, and other terms which are more or less accurate, general and confusing. The gas combinations more commonly used for torch or blowpipe welding are either oxygen-acetylene or oxygen-hydrogen. Of these two, oxy-acetylene is in more general use for welding, while oxy-hydrogen, on account of its longer flame, is generally used to supply heat for steel-cutting torches. The oxy-acetylene flame has a maximum heat, under ideal conditions, of about  $3,400^{\circ}\text{C}$ ., and oxy-hydrogen about  $2,600^{\circ}\text{C}$ .

FIG. 6.—Principle of the low-pressure or injector type of gas torch.

The use of a blowpipe or torch in some form was known to the ancients, but the high-temperature gas flame is principally a development since 1910. The application of the oxy-acetylene torch to metallic welding dates experimentally from 1901 and commercially from 1903; Edmond Fouché, Paris, who did considerable experimenting in conjunction with Picard, is generally credited with making the first really practical torch. The early torches used both oxygen and acetylene under high pressure, but this proved too dangerous, and a low-pressure or injector type was next used. Following this was the Gauthier-Ely positive- or medium-pressure torch, which used both gases under moderate and independent pressure. The injector and the positive-pressure types are the ones now in commercial use. The development of the latter is largely due to Augustine Davis and Eugene Bournoville.

FIG. 7.—Principle of the medium or positive-pressure type of gas torch.

The fundamental principle of the low-pressure or injector type of torch is shown in fig. 6. The acetylene enters at A and the

oxygen at B. The acetylene, at less than 1 lb. pressure, goes to chamber C, from which it is sucked by the oxygen, under 5 to 30 lb. pressure, pouring out of nozzle D, and is carried along with the oxygen into the mixing chamber E. The thoroughly mixed gases issue from the nozzle of the torch, where they are burned.

FIG. 8.—A typical positive pressure torch.

**Positive-Pressure Torch.**—The positive-pressure torch principle is illustrated in fig. 7. Here the oxygen, at from 1 to 14 lb. pressure, enters at A, and the acetylene, at from 1 to 24 lb. pressure, enters at B. The oxygen enters the small chamber C and thence out through the centre hole. The acetylene goes to chamber D and also out through the centre hole. The two gases start to mix at E and are thoroughly mixed in the channel F in the torch nozzle G. A typical positive-pressure torch is shown in fig. 8. Torches are made with tips set at various angles from  $90^{\circ}$  to straight, the latter being principally used in welding and cutting machines. Where the work is heavy the tips are water-cooled. In welding very thin metal the edges are often turned up or "flanged" and the torch used to fuse them together without using any additional metal. On heavier work the edges to be welded are V'd out at an angle of from  $60^{\circ}$  to  $90^{\circ}$ , and this channel is filled in by using a welding rod or wire, care being taken to obtain perfect fusion between the old metal and new. Welding of this kind is progressive, as the welder gradually

FIG. 9.—Typical oxy-acetylene cutting unit.

works along the channel, filling as he goes. The torch is given a weaving motion from side to side in order to fuse the sides of the

V and to puddle in the added metal from the rod. On all torch welding work allowance must be made for expansion and contraction, and on repair work of complicated design, like an automobile cylinder, preheating with charcoal, gas-and-air torches or other means is usually necessary. Preheating is also sometimes resorted to in order to save the more expensive gases. Nearly all of the common metals may be welded with the gas torch, though some are more difficult than others. Steel ship or boiler plate is about the easiest, though aluminium, cast iron, copper and many alloys present no serious difficulties.

**Cutting Torches.**—The set-up for a welding outfit is practically the same as that of the one for cutting shown in fig. 9. A cutting torch, however, differs from a welding torch in that it has a separate high-pressure oxygen vent. The cutting of steel and wrought iron is based on the fact that a jet of oxygen directed on to a previously heated spot of steel causes it to ignite and burn away rapidly in the form of iron oxide. The oxide runs or is blown out of the cut or "kerf" in a stream, provided the torch is fed along properly. The tips used for cutting may have one or several heating jets preceding or surrounding the cutting oxygen jet. Only steel or wrought iron can be successfully cut on a commercial scale, though channels or slots may be melted in any metal. A typical job of steel plate cutting is shown in fig. 10, and a typical cutting torch in fig. 11. Cast iron is cut with difficulty, and only by using a special tip and highly preheating the oxygen in a positive-pressure torch or by using an excess of acetylene and an unusually large tip on the low-pressure types.

FIG. 10.—Cutting through a steel plate.

FIG. 11.—A typical cutting torch.

**Gas Supply.**—The same sources of gas supply are used in cutting as in welding. These are, commonly, cylinders or drums containing the gases under pressure up to 225 lb. per sq. in. and from 50 to 100 cu. ft. capacity for acetylene, and 1,800 lb. per sq. in. and from 100 to 200 cu. ft. capacity for oxygen or hydrogen. Acetylene, however, may be generated on the premises, in which case the pressure must not exceed 15 lb. per sq. inch. Obviously, pressure as great as that mentioned for cylinders must be reduced for use in the torch, and for this purpose regulators are used which automatically keep the gases supplied to the torch close to the pressure for which they are set. In many large plants practically automatic gas-torch welding machines are used for straight or circular seam welding of drums, cylinders, tubes, kettles and the like.

**Cutting Machines.**—Cutting machines are much more commonly used than welding machines. The cutting machines range from the simple, hand-fed, straight-line cutters to complicated motor-driven automatic machines that will cut rounds, squares, ovals or other patterns. One type of cutting machine is made on the pantograph principle, and by following a template or pattern the operator can use two torches and cut two separate steel plates at once. A cutting machine will, as a rule, cut a narrower and more even kerf than can be done by hand. Under favourable conditions a machine can be made to cut a kerf not over  $\frac{1}{2}$  in. wide, while a careless or inexperienced operator with a hand torch may cut a kerf  $\frac{1}{4}$  in. or more in width. Torches are also now made so that divers can cut steel ship plates while completely submerged under water. (E. VI.)

**WELFARE WORK:** see INDUSTRIAL WELFARE.

**WELLHAUSEN, JULIUS** (1844–1918), German Biblical scholar and Orientalist (see 28.507), died at Göttingen Jan. 7 1918.

**WELLINGTON**, New Zealand (see 28.513), has recently increased largely. Onslow, Karori and Miramar have been incorporated in the city area, which has now an acreage of 15,951, with 1,613 ac. of reserves. The population of the city proper was 94,340 in 1923, and that of the whole area was 114,510 in 1924. There is a town belt of 970 ac., which is leased for grazing but is open to public access. Robertson Park, (3 ac.) was given to the city in 1919, and Keith Izard Park (11 ac.) in 1921. The municipality owns a seaside resort outside its boundaries at Days Bay, which has been renamed Williams Park in memory of the donor of a large sum of money towards its purchase. The municipality has also controlled the sale and supply of milk since 1919, and has a butter and cheese factory 47 m. from the city. In 1924 a water supply scheme was finished, involving a pipe-line from the Orongorongo river to Karori reservoir and a tunnel two miles long under the mountains. A power station at Evans Bay was finished in 1925, and water and drainage schemes are being carried out at Onslow and Karori. An automatic telephone exchange was built in 1925.

**WELLS, HERBERT GEORGE** (1866– ), British man of letters (see 28.514), continued between 1919 and the outbreak of the World War to publish novels of which the plots are subordinated to sociological speculation. The most famous of these, *The New Machiavelli* (1911) describes an ambitious reformer who begins his political career as a Liberal member of parliament, and then, disgusted by party politics, advocates a democratic, an almost socialistic imperialism, but is ruined by the publicity given to his private amours. In *Marriage* (1912) are described a husband and wife who, despite the romance attending their first meeting, bore each other until they leave civilisation and rediscover themselves in icy and dangerous Labrador. Mention should also be made of *The Passionate Friends* (1913), *The Wife of Sir Isaac Harman* (1914) and *The Research Magnificent* (1915) which, despite the date of its publication, is essentially a pre-War novel. *Boon* (1915) was not immediately acknowledged by Mr. Wells. This work, nevertheless, displays Wells at his best. That impartial artist Henry James is fiercely mocked, more fiercely perhaps than he deserved; and a flood of Mr. Wells' excellent scorn is directed against such journalists as Mr. E. B. Osborn of *The Morning Post*. The wild asses of the devil have been released, and until they could be gathered again, civilisation was in jeopardy. War broke out; and eagerly, perhaps too eagerly, Mr. Wells tried to corral those errant asses.

During the War Mr. Wells' liberal imagination was freely given to the support of the allied cause. A host of pamphlets, written at red heat, championed Western Europe against the brutal stupidity which Mr. Wells thought to discover both in the German enemy, and the cruder English propaganda. Mr. *Britling sees it through* (1916) is the best known of his War time publications. This novel explains the mentality of a British publicist, whose eldest son is at the front, and finally displays Mr. Britling, half maddened by the outrages of war, and wholly broken hearted because his best beloved son is dead, poring over an atlas, and tracing new frontiers. Subsequently Mr. Wells failed to resurrect his novelistic talents. *The Undying*

*Fire* (1919) more nearly resembles a philosophic dialogue than a story, and has been awarded less praise than it deserves. *Men Like Gods* (1923) was a bold and brilliant experiment in Utopianism, but too often crude satire took the place of intelligent criticism. In *The Dream* (1924) Mr. Wells mingled prophecy and humour, and found that his public was tired of the future. Therefore in *Christina Alberta's Father* (1925) he magnificently returned to his earlier manner, and again succeeded in impressing upon the general imagination the delightful creatures of his fancy.

Meanwhile, in his *Outline of History* (1919-20), Mr. Wells gave his most powerful and his most delightful criticisms of modernity. Many have found fault with the book. Scholars have been shocked by the author's contempt for Caesar and Napoleon, or have denounced in the prehistoric chapters a too ready acceptance of fragile hypothesis as solid fact; and partisans have declared that Mr. Wells, despite the expert advice given to him, remains a slave of the late Victorian materialism. No one else, however, has written a history of the world, and Mr. Wells, in the interim, holds the ground. Moreover, it supplies as no other history has done, a fairly complete conspectus of the past.

No one has done, or can do, more than Mr. Wells to suggest an alternative to our present civilisation. Mr. Wells is radically minded, and would like to replace what is by what might be. He is also so susceptible to fashion, that he is unable to break away from the apparatus of ordinary civilisation. He has, however, ideas of his own. In the clash of these three things, Mr. Wells is in danger of losing direction. Apart from his literary talents, Mr. Wells seems, by the influence exercised on his juniors, to belong to the tradition of Carlyle and Ruskin. He has supplied rebellious youth with a formula whereby existing institutions are challenged and condemned, and he has offered to conformists a prospect of a civilisation steadily increasing in strength. In his style he avoids both Carlyle's obscurity and Ruskin's affectations, and his pure bright English will survive the themes on which it is expended.

**WELSH LITERATURE** (see 5.640).—The period 1910-25 marks the emergence of a new school of poets with new aesthetic ideals, a fresher and wider outlook and, it may almost be said, a new diction and vocabulary. Its poetry represents the hard-won triumph against the Puritan rigidity which lay heavy on the last decade of the 19th century, and the reaction against the provincialism which the cultural isolation of Wales had intensified. The new influences were twofold. First, the more scholarly study of Welsh literature, particularly of the age of Dafydd ap Gwilym and the 15th century, and the scientific investigations of the language and of Welsh history, revealing the literary heritage of the Middle Ages, showed the necessity of purging the language of corrupt grammatical forms, English idioms, and alien style and mannerisms. Secondly, with the wider culture came foreign influences, French, German, Irish, the Classics and English poetry. The translations of Heine by J. Morris Jones revealed to some extent the secret of that supreme lyricist. The lyrical art of Eifion Wyn is surer and more adequate in technique than that of his predecessors, whilst his *Awdl y Bugail* had shown that lyric diction was possible in the alliterative strophes.

Scholarship and learning reacted on literature, and the first fruits appeared in the work of T. Gwynn Jones, the leader of the new school and its most accomplished craftsman. His *Ymadawiad Arthur, a chaniadau ereill* (1910) announced the advent of a poet of the first rank. The title poem, the winning ode of the national Eisteddfod of 1902, was the flaming manifesto of the new school. No such music had been heard in Wales since the Reformation. The rich decoration and missal-like colours of the poem conjured up the glamour and enchantments of the past. Both the subject and its treatment are symptomatic. The romantic legend of Arthur replaces the former theological or Hebraic theme. The diction and vocabulary are in the tradition of the classical age of

Welsh poetry. This is not to say that the poem is pedantic or archaic, but rather that the artist has so absorbed the spirit of his models that he has created his own medium by extending and enriching the resources of his speech. Equally characteristic is the superb mastery, unrivalled in this period, of the strict metres, the artistic economy of words, the grave and resounding music and the vivid and accurate description of external objects by which the poem conveys the impression of a splendid canvas. A powerful historical imagination, fortified by wide reading but illumined by poetic intuition, has inspired much of Gwynn Jones's best work, such as the beautiful *Penmon* in this collection, and *Madog*. The promise of the first volume has been more than fulfilled. In *Madog*, among the greatest achievements of Welsh poetry, the stately movement of the elegiac is adopted, with alliteration virtually replacing the older harmony of quantity, producing a noble and sonorous line adequate to the lofty theme and perhaps the best expression of the poet's genius. *Tir na N-Og* (1916) a lyrical drama, displays to the full his command of the alliterative metres, which are here made to yield some exquisite music.

W. J. Gruffydd is a poet of considerable, if unequal, achievement. His fearless advocacy of the new school has presented a wide target for the hostile. His early poetry was criticised as imitative, and certainly its inspiration is largely derived from his reading. Keats, Shelley, Swinburne (whose rather sickly *Dolores* stanza is imported), Kipling, Hardy and the moderns furnish a too obvious contribution. But this springs not so much from poverty of inspiration as from the impact of fine poetry on a sensitive intelligence, and his work is rarely incompetent in craftsmanship even when merely purveying the manner and ideas of other poets. *Ynys yr Hud* (1923) shows a marked advance. There are traces of the early weaknesses—reminiscences of other poets, though fainter and less imitative, and touches of bitterness, though now often rising to a noble anger. At his best, as the poet of the common Welsh life of the villager, the quarryman, the farmer and the shopman, Gruffydd must rank high, and he, almost alone of his contemporaries, has conveyed the romance and realism of the fast-vanishing sea life of the North Wales coasts.

The publication of *Yr Haf, a cherddi eraill* (1924), by R. Williams Parry, is a landmark in Welsh literature. This slender volume revealed a wealth of poetic endowment and a purity of song unsurpassed since Dafydd ap Gwilym. The main poem, *Yr Haf*, an ode of summer and young love, although strictly alliterative, is, by the poet's delicate technique and enchanted diction, essentially lyrical. The memorial *englynion* are among the triumphs of poetry. Their restraint and terseness recall the early *englynion* (of the Graves); and, though rich in alliterative effects, they have the inevitable music of true lyric. Parry has also been the most successful in transplanting the sonnet form, and the sonnets in this volume show again his fastidious care in the choice of words to express his moods with the greatest intellectual effect. Remarkable, too, is the outlook of the poet: he stands aloof and indifferent to the clash of parties and creeds which occasionally disturbs the harmonies of his contemporaries: he has the artist's faith in beauty, from which his sensitive, poetic temperament draws its inspiration and sustenance.

The poetry thus brilliantly inaugurated continued to flourish. T. Parry-Williams has marked individuality and accomplishment, but the intellectual content of his poetry often overbears the imaginative element. *Cerdd'r Bugail* (1918) a posthumous collection of the poetry of Hedd Wyn, a shepherd poet killed in action, attracts notice by its promise and by the mystical strain of its thought. The verse of Cynan at its best has much lyric sweetness and simplicity, but his *Mab y Bwthyn* (1921) and *Y Tannau Coll* (1922) are marred by a false, sentimental treatment of commonplace sex themes.

In prose the output has been disappointing. There has been no successor to Daniel Owen, and no prose writer with the limp grace of O. M. Edwards. *Hunangofiant Tomi* (1912) and *Tir y Dyneddion* of E. Tegla Davies have charm and show a capacity for dialogue, but their range is limited. The main prose develop-

ment has been in the ephemeral journalism of the period or in the literary reviews such as *Y Llenor* (founded 1922), or in the pages of the learned journals, where Welsh prose is acquiring a flexibility and an adaptability for the requirements of criticism and modern scholarship.

J.)

**WEMBLEY**, England (see 28.517).—The population of this residential suburb of London, which has an area of 4,564 ac. was nearly quadrupled between 1901 and 1921, when it was 16,187. Wembley, now served by three railways (Metropolitan; London, Midland and Scottish; London and North Eastern), provided the site for the British Empire Exhibition in 1924 and 1925. It covered a semi-circular tract about 2½ m. round, with railways north and south and within the grounds. A main thoroughfare, Kingsway, leading from the north entrance, was flanked by the palaces of industry and of housing and transport, and by the buildings for Australia and Canada, and gave at the southern end upon the stadium, which had an area of 10 ac. and accommodated nearly 100,000 people. Here were staged numerous ceremonies, spectacles and athletic contests. Besides those mentioned above, each major division of the empire overseas had its pavilion, the most notable being those of India, South Africa, New Zealand and Malaya. There was a British Govt. pavilion, with exhibits by various government departments and a scientific exhibit organised by the Royal Society. There were also a palace of arts, an amusement park and many other features designed at once to demonstrate the vast resources of the Empire and to attract the public. (See also EXHIBITION: BRITISH EMPIRE.)

**WERFEL, FRANZ** (1890– ), German poet, was born in Prague Sept. 10. 1890. During the first 10 years of his career he lived (1911–21) in Hamburg, Leipzig and Vienna. His poetry is contemplative and lyrical, and the idea of the community of souls in all living beings is strongly emphasised in his collections of verse, *Der Welfreund* (1912), *Wir Sind* (1913), *Einander* (1915), *Der Gerichtstag* (1919) and the selection, *Gesänge aus den drei Reichen* (1917). Among Werfel's successful works for the stage are, a German adaptation of the *Troades* of Euripides (1915); and the trilogy, *Der Spiegelmensch* (1920), which was performed in 1921 and 1922 at Leipzig, Stuttgart, Vienna and other cities. In his subsequent works Werfel dealt with general problems in a historical setting. His drama, *Juarez und Maximilian* (1924), represents the differences between democratic-republican and monarchistic thought, while his novel on the opera *Verdi* (1924), contrasts the artistic conceptions of Wagner and Verdi. See A. Luther, *Franz Werfel und seine besten Bühnenvorwerke* (1922).

**WERNER, ANTON ALEXANDER VON** (1843–1915), German painter (see 28.523), died in Berlin Jan. 3 1915.

**WESLEYANISM**, see METHODISM.

**WEST AFRICA, FRENCH** (*l'Afrique occidentale française*) (see 11.205). The era of peaceful development which followed the establishment of French rule in the interior had led by 1923 to the setting up of civilian administration over the whole of this vast region. The colony of Upper Volta was formed in 1919 from the southern part of Upper Senegal and Niger, which, in 1920 was renamed the French Sudan. The military territory of the Niger was made the Niger Colony in 1922. Mauritania became a colony on Jan. 1 1921. The approximate areas and populations of the separate colonies in 1924 are shown in the table. The European population was estimated in 1925 at 8,000.

The whole of the area is under a Governor-General, who is responsible for services common to all the colonies. Each colony is under a lieutenant-governor.

| Colony                  | Area in sq. m. | Population |
|-------------------------|----------------|------------|
| Senegal . . . . .       | 74,112         | 1,266,116  |
| French Guinea . . . . . | 89,436         | 2,026,321  |
| Ivory Coast . . . . .   | 121,590        | 1,301,832  |
| Dahomey . . . . .       | 41,302         | 974,597    |
| French Sudan . . . . .  | 356,471        | 2,561,515  |
| Upper Volta . . . . .   | 142,820        | 3,015,388  |
| Mauritania . . . . .    | 154,200        | 284,598    |
| Niger . . . . .         | 404,914        | 1,149,564  |
| Total . . . . .         | 1,384,845      | 12,579,931 |

The contentment of the natives and the increase in population and production were evidence of the success of French methods during the period 1910–25. A military force of 16,000 men, of whom 2,000 were Europeans, was maintained in peace time; during the World War large numbers of Senegalese and other native troops were sent to France; the only regions not peaceful during the War period were those bordering the Sahara. Improvement in means of communication was a leading feature of French policy. By 1924 railways from Dakar and Konakri linked the seaboard to the Niger, which in French territory is navigable for over 1,000 miles. About half of the total trade of the colonies is with France and other French possessions. Imports are mainly textiles, hardware, machinery and coal. Some 75% of the exports are oil seeds or other oleaginous products. The cultivation of cotton is actively encouraged; maize and cocoa are exports of growing importance. The total volume of trade in 1924 exceeded 1,000 million fr., as compared with about 640,000,000 fr. in 1919 and 177,000,000 fr. in 1907. For other parts of West Africa see ANGOLA; CAMEROONS; TOGOLAND, etc.

**WESTERMARCK, EDWARD ALEXANDER** (1862– ), Finnish anthropologist, was born at Helsingfors Nov. 20 1862. He was educated at a lyceum in his native town, and at the University of Finland where he later became professor of moral philosophy. In 1890 he went to England, and in 1907 was appointed professor of sociology at the University of London. He made a special study of primitive marriage and ethical origins, and published *The Origin of Human Marriage* (1889); *The History of Human Marriage* (1889, 5th ed. rewritten in 3 vol. 1921); *The Origin and Development of the Moral Ideas* (1906); *Marriage Ceremonies in Morocco*, 2 vol. (1914).

**WESTERN AUSTRALIA** (see 28.539), a state of the Australian Commonwealth. Its area is 975,920 sq. miles. The population in 1925 was 368,027 as compared with 282,114 in 1911. Perth, the capital, which on Dec. 31 1924 had a population of 176,467, and Kalgoorlie, the centre of the gold mining industry, are the chief towns. The principal port is Fremantle, the first port of call for mail steamers from Europe; Albany, in the extreme southwest, is the first port of call for shipping from Europe via the Cape. The farmers are well organised politically, and the Country party plays an important part, in coalition with the Liberals or Nationalists, in the Government of the country.

The gold mining industry, which was for many years the chief source of wealth, has dwindled steadily since 1903, when the output was valued at £8,770,719. In 1923, it was £2,232,179, representing two-thirds of the total Australian production. Steady progress has been made, however, in the development of the primary industries. State-aided immigration, backed up by a vigorous land settlement policy, with liberal financial assistance to settlers through the State Agricultural Bank, has attracted settlers, not only from overseas, but also from the eastern Australian States.

*Production and Industry.*—Wheat is the principal crop, and in 1925, 1,867,614 ac. were harvested, yielding 23,887,367 bu. In the closer settled areas of the southwest, dairy and fruit farming are making rapid progress. The annual production of the pastoral industry now exceeds £4,500,000. In the north-west territory are millions of ac. of pastoral country awaiting development, and at Wyndham the Government has erected large works for the killing, freezing and canning of meat for export. Western Australia's hardwoods have a world-wide

reputation, especially jarrah and karri, which are indigenous to the southwest districts. Sandalwood is also exported in large quantities to the Far East. Western Australia produces more than one-half of the world's supply of pearl shell. Broome in the northwest is the centre of this industry. The maximum production, reached in 1914, represented a value of £90,000 for pearls and £221,000 for pearl shell.

The manufacturing industries have not been developed to any great extent. A state implement and engineering works was established in 1912 with a view to keeping a check on prices of agricultural machinery. The Government also operates six saw mills. In 1925 there were 3,733 m. of Government controlled railways, on a 3 ft. 6 in. gauge, open for traffic. The completion of the trans-continental railway between Kalgoorlie and Port Augusta in 1917 linked up the Western and South Australian systems. (*See AUSTRALIA.*)

**WESTERN FRONT.**—For a good many years after the end of the Franco-Prussian War of 1870-1 the military policy of France was defensive. Large sums of money and much labour were spent upon the elaboration of an extensive system of fortifications on the Eastern frontier; and military discussions turned largely upon how those fortifications could best be utilised in the event of a war with Germany. But time passed, and France recovered morally and materially from the effects of her defeat; an offensive and defensive alliance was concluded with Russia, and the establishment of an entente with Great Britain, if it did not assure France definitely of military assistance from that quarter, at least made such assistance possible.

**French Military Policy.**—Simultaneously with these developments there had been a marked increase in the general efficiency of the French Army; French inventive genius had perfected the best field gun in existence and had made France a pioneer in the conquest of the air. Under these conditions a new school of military thought had grown up, to which the idea of awaiting attack was repellent; the offensive was advocated as the true military policy of France, not only as conferring definite military advantages but as being in consonance with the national character, and as the only means of avoiding a passive acceptance of the horrors of invasion, a course naturally repugnant to a proud nation. The swing of the pendulum was pronounced and in the new zeal for the promotion of the spirit of offence the study of the use of field fortifications was neglected, while the addition of heavy artillery to the field army was opposed as being destructive of mobility and of the *élan* of attack. In this spirit the French plan of campaign was revised, and "plan 17" came into existence with an immediate and general offensive as its basis.

In the preparation of this plan the attitude of Belgium and of Great Britain were uncertain factors. Provision was, however, made for the eventuality of Belgium permitting German troops to march through her territory, while discussions between the French and British General staffs, authorised by the two Governments, resulted in an agreement, that if Great Britain joined France, her expeditionary force should be assembled in the neighbourhood of Maubeuge. The plan was, however, based upon a fundamental miscalculation as to the strength of the army which Germany could bring against France. While it was accepted that the poverty of Russia's communications would make that country's mobilisation very slow, and that therefore Germany would almost certainly assemble the largest possible army on her western frontiers to meet France, the strength of that army was estimated at not more than 40 to 42 active infantry divisions and ten cavalry divisions. The French General staff was aware that Germany proposed to create on mobilisation a number of reserve divisions, as they themselves also did; but they did not believe that these reserve formations would be like their own, able to take more than a secondary part in the campaign, at least until after a considerable interval.

**Plan 17.**—Plan 17 envisaged the employment of 10 cavalry, 45 active and 21 reserve divisions organised in five armies, of which the I., II., III. and V. were drawn up from right to left along the frontiers of Alsace-Lorraine and Belgium, Luxembourg, while the IV. formed a general reserve between Verdun and

Châlons-sur-Marne. It provided for an immediate offensive into Alsace-Lorraine by the I. and II. armies, to be followed by a general offensive on either side of the fortified zone of Metz and Thionville. When Belgium, proudly refusing the German demand for permission to march through her territory, prepared to resist and Great Britain, declaring war upon Germany, began to put into execution the plans agreed upon between the two staffs, the confidence at French headquarters in the efficacy of plan 17 was complete. The Belgian Army of six divisions and a cavalry division might, with the aid of the strong fortresses of Liège and Namur, be relied upon to delay the Germans for some time, while the French left was assured of the support of a British force of at least four infantry divisions and one cavalry division. General Joffre, the French commander-in-chief, was therefore confident that he had a sufficient superiority of force to justify the agreed policy of attack.

**German Plan of Invasion.**—The German plan for a war on two fronts was formulated in 1905 by Count Schlieffen, then chief of the General staff, and provided for the earliest possible offensive in the greatest possible strength against France, while Austria was assisted with the minimum of force to hold off Russia. The decision against France was to be sought by a great enveloping movement across the Meuse, through Belgium and beyond the zone of the French frontier defences. Thus a deliberate violation of Belgium's neutrality was planned many years before 1914. This plan was accepted in principle by Schlieffen's successor, the younger von Moltke, but as years passed and the development of the offensive spirit in the French army became evident, it was modified in the direction of strengthening the left flank in Alsace-Lorraine, whereas Schlieffen had maintained to the end of his life that risks should be accepted upon that flank, in order that the right should be made as strong as possible.

The plan as it developed in Aug. 1914 provided for the organisation of the force to take the field against France of seven armies composed of 10 cavalry, 72 active and reserve divisions, six Ersatz divisions and 14 Landwehr brigades. The Ersatz and Landwehr troops were intended for the garrisoning of occupied territory and the protection of lines of communications, but the great majority of the reserve divisions were organised in army corps and employed alongside the active divisions. Not only was the organisation and equipment of these reserve divisions far superior to that of the reserve divisions of the French Army, but Germany was ahead of the rest of the military world in the provision and tactical employment of machine guns and of heavy artillery, while her plan of campaign combined judiciously the employment of offensive and defensive methods.

The seven German armies were deployed along the frontier from Switzerland to Holland. On the left the VI. and VII. under the Crown Prince Rupprecht of Bavaria were to act at first mainly on the defensive in Alsace-Lorraine, while the remaining five armies (55 active and reserve divisions, and seven cavalry divisions) formed the great moving wheel against the French centre and left. Of these five armies two, the I. (Von Kluck) and the II. (Von Bülow), comprising 26 divisions and five cavalry divisions, were to cross the Meuse, while the III. (Von Hausen, eight divisions) and the IV. (Duke Albrecht of Württemberg, ten divisions) marched through the Belgian Ardennes. The way for the I. Army was to be opened by a *coup-de-main* of a special striking force under Gen. von Emmick on Liège.

French and German military policies having now been outlined an account of the actual campaigns can be undertaken.

### I. OPERATIONS IN 1914

The invasion of Alsace was begun in accordance with plan 17 by a preliminary enterprise on Aug. 8, followed by the main advance of the I. and II. French Armies under Gen. Dubail and de Castelnau on Aug. 14. This advance was stopped on Aug. 20 in the battle of Morhange-Saarburg, in which the French could make no impression on the German defensive positions. The two armies were compelled to retreat to the frontier, where, between Aug. 25 and 27 the attacks of the pursuing Germans were repulsed (*see FRONTIERS, BATTLES OF THE*). Meanwhile, the ap-

pearance of the Germans before Liège had caused a modification, which had been foreseen as probable in plan 17. The V. Army (Lanrezac) was moved to its left towards the Sambre, while the IV. (Langle de Cary) took its place about Mézières. A movement of the Germans through Belgium on either bank of the Meuse had been foreseen as probable, but the French staff had not considered it probable that the Germans could dispose of more than three or four cavalry divisions and 22 infantry divisions for this purpose, whereas actually they had five cavalry and 34 infantry divisions (I., II. and III. Armies). The result of the miscalculation of German strength was disastrous. Joffre, believing that if the enemy were strong enough on the left to check his attack in Alsace-Lorraine and on the right to move in force through Belgium beyond the Meuse, he must be weak in the centre, proceeded on Aug. 21 to launch his IV. Army and his III. (Ruffey) in the attack of that centre in the Ardennes. This attack failed on Aug. 23, by which time Joffre had become aware of the realities of the situation (*see* FRONTIERS, BATTLES OF THE).

The Germans, after a first failure of a night assault by their infantry, had entered Liège on Aug. 7, though as the forts still held out, this fact was not known at French headquarters. While those forts were being reduced by German heavy artillery, Von Kluck was completing the arrangements for the advance of his I. Army, which met and defeated the Belgians on the Gette on Aug. 18. On the 20th the first German troops entered Brussels and on the same day they began to bombard the forts of Namur (*see* BELGIUM, INVASION OF). Meanwhile the French V. Army had deployed along the Sambre on either side of Charleroi with its right flank on the Meuse above Namur. This army had been reinforced by Joffre from his right and comprised 13 divisions, (three reserve), one cavalry division and a cavalry corps of three divisions attached.

#### THE ALLIED EFFORT: AUG. 21-SEPT. 13

On Aug. 21 the concentration of the British expeditionary force was almost completed and it began to move forward from behind the fortress of Maubeuge towards Mons. It comprised four infantry divisions, one cavalry division with an additional infantry and cavalry brigade. The strength of the Allied left wing was therefore approximately 17½ infantry and 4½ cavalry divisions, while the Belgian fortress of Namur formed what was regarded as a strong pivot on its right flank and the French fortress of Maubeuge, hastily improved by the addition of field defences, a support to its left flank.

After the battle of the Gette the Belgian Army had entered into the fortress of Antwerp and Von Kluck had detached two army corps, the III. and IX. Reserve Corps, to watch it and cover his flank and communications. This detachment and the provision of a garrison for Brussels, left for the three German armies of the right wing, the I., II. and III., advancing against the allied left, a force of 30 infantry and five cavalry divisions, as against the French estimate, inclusive of detachments left in Belgium, of three or four cavalry and 22 infantry divisions.

Acting on the information as to the enemy's strength supplied by Joffre, Sir John French's little army reached Mons and its neighbourhood on Aug. 22, expecting to advance further into Belgium. It is often suggested by French writers that the concentration of the British army was tardy, and that to this was largely due the loss of the battle of Charleroi. To this it may be answered that the Germans had not expected that the British could arrive in France so soon, and they were completely surprised by their appearance at Mons, while it is obvious that a further advance would merely have made the British position more precarious than it proved to be. When Sir John French's troops reached Mons, he learned that Lanrezac's V. Army had been attacked on the 21st on the Sambre and had lost the crossings over that river. Late on the 22nd he agreed to stand at Mons, to cover Lanrezac's left, believing that he would not be attacked by more than two army corps.

On Aug. 23 Lanrezac learned of the fall of Namur and that his right flank was dangerously menaced by the appearance of the German III. Army on the Meuse above Namur about Dinant.

He therefore ordered a retreat during the night of the 23rd-24th, a decision confirmed the next day by Joffre, who had at last become aware of the true strength of the German armies which were attempting to envelop his left. The enemy had proved to be strong enough both to defeat the two great French attacks on either side of Metz, and to march through Belgium west of the Meuse in menacing force. During the 23rd Sir John French, whose army had withstood the attacks of three German army corps at Mons, became aware that his position, which was far in advance of Lanrezac's left, was untenable, and he too ordered a retreat which began the next morning. Thus the whole structure of plan 17 had collapsed within 10 days of the beginning of the first part of the French main offensive.

*Plan 17 Replaced.*—Joffre at once formed a new plan to meet the danger to his left wing. He decided to swing back his centre and left, pivoting on Verdun, and to create on his left "a mass capable of resuming the offensive while the others hold up the enemy for the required time." The mass, he explained in an order issued on Aug. 25 was to consist of his IV. and V. Armies, the British Army and a new army, the VI. under Gen. Maunoury, to be created from troops drawn from his right.

This order is the key to the manoeuvres which culminated in the battle of the Marne, for it indicates Joffre's purpose; maintained with rare courage in circumstances of great trial, to answer the German attempt to envelop his left by an envelopment of the German right. The French commander-in-chief hoped to be able to begin this counter-offensive from the line La Fère-Peronne, and with that object began to assemble the new VI. Army behind the Somme, in the neighbourhood of Amiens. But the German pursuit proved to be too vigorous. On Aug. 26 Von Kluck caught up the British II. Corps under Gen. Smith-Dorrien, and left its commander no option but to fight at Le Cateau, though this was contrary to Sir John French's intentions.

Sir John French, believing his army to be in grave danger, and being in some doubt as to the power of the French to help him, thereupon ordered a rapid retreat across the Somme and behind the Oise. Joffre, meanwhile, in order to help the British, had directed Lanrezac to stand and attack Von Bülow's II. Army, which he did in the battle of Guise on Aug. 29. Lanrezac requested the co-operation of the British I. Corps, under Sir Douglas Haig, which Haig was prepared to give, but this was forbidden by Sir John French, who held that an immediate further retreat was necessary. This retreat necessarily involved the French VI. Army on the British left and as the French IV. Army had continued also to retreat while Lanrezac was fighting at Guise, the position of the French V. Army became highly dangerous, as it was threatened on both flanks.

*Von Moltke's Blunder.*—On Aug. 23 the German right had reached positions in advance of that allotted to it in the Schlieffen plan, and in the following days a succession of reports of great victories poured into German headquarters. Von Moltke appears to have been deceived by these reports into thinking that the Allied armies had been decisively defeated, and under that impression he took what proved to be a fatal step. Before the whole of the Russian armies had been concentrated, two had advanced into East Prussia in order to relieve the pressure upon their Western Allies. The comparatively weak German forces opposed to them had been defeated at Gumbinnen on Aug. 20 and there was alarm in East Prussia and even in Berlin.

To relieve the situation on the Eastern front Von Moltke on Aug. 25 ordered two army corps, one from the II. and one from the III. Army to East Prussia, and at the same time it was necessary to detach another corps from the II. Army to besiege Maubeuge. Thus the German right flank, which was required to make the decisive effort, was weakened by six divisions, a force about equal to Sir John French's army, which had been increased by one division on the eve of the battle of Le Cateau. Further, Von Moltke, who was in failing health and physically incapable of personally visiting critical points on the long front, was unable to direct the manoeuvres of his right wing from his distant headquarters, which were established, first at Coblenz and subsequently at Luxembourg.

To obviate this difficulty Von Kluck's I. Army had been placed under the direction of Von Bülow, who commanded the II. Army. This was faulty organisation, since a man occupied with the executive command of one body cannot successfully also direct another. The arrangement, therefore, broke down and Von Kluck was released from Von Bülow's control. When the latter was attacked by Lanrezac at Guise he appealed for help to Von Kluck, who on his own initiative, began on Aug. 30 to wheel inwards, from the neighbourhood of Amiens, in an endeavour to strike at Lanrezac's flank. By this manoeuvre Von Kluck changed direction so as to bring his line of march, which according to the Schlieffen plan had been directed to the west of Paris, to the east of the French capital and he neglected both the French VI. Army and the British, who retreated almost unmolested after the battle of Le Cateau.

On Sept. 1 Joffre, still preoccupied with the situation of his V. Army, which had not been freed from its embarrassments, issued an order for the continuance of the retreat. The left was, if necessary, to retire behind the Seine and Joffre was prepared to abandon Paris rather than his plan of a combined counter-offensive by all the armies of his left wing. This proved in the event to be unnecessary, for the VI. Army had fallen back within the defences of Paris and on Sept. 3 General Gallieni, the Governor of Paris, discovered that Von Kluck was making a flank march to the east of Paris and while preparing Maunoury to attack the German right, got into communication with Joffre and urged an immediate offensive. By the evening of Sept. 4 the V. Army had crossed the Marne and had sufficiently freed its flanks from danger to enable it to play its part in the manoeuvre which Joffre had envisaged since Aug. 25. So on that evening the French commander-in-chief issued the orders which brought about the battle of the Marne (see MARNE, FIRST BATTLE OF THE).

*Changes in Commands.*—Before that battle was joined Joffre had made wholesale changes amongst his generals. Ruffey gave place to Sarraill in command of the III. Army, Franchet d'Espèrey succeeded Lanrezac in the V. Army, and a large number of those who at the outset had commanded corps and divisions were removed. Away on the right, too, an event had taken place which had great influence on the issue of the battle of the Marne. Von Moltke, still obsessed by the extent of his victories on the frontiers, believed that it would be possible to carry out a double enveloping movement, and with that end in view instructed the Crown Prince Rupprecht to endeavour to break through to Nancy. That effort, begun on Sept. 4 and lasting for three days of fierce fighting, was broken by Castelnau's II. Army on the Grand Couronné. Thus the German plan which had envisaged the complete defeat of the French armies within 40 days had broken down. The fact was for a long time kept secret from the German people, but one of its immediate results was the replacement of Von Moltke by Gen. von Falkenhayn as Chief of the General Staff.

*Operations in Belgium.*—We must now return to Belgium, where the Belgian Army was left within the defences of Antwerp, watched by two German reserve corps. That army began on Aug. 24 a sortie to assist the British and French forces fighting at Mons and on the Sambre. Good progress was at first made and the fighting was continued throughout the 25th, but on the 26th, when news was received of the retreat of the Allies and of Joffre's intention to resume the offensive later, it was determined to return within the lines of Antwerp and to await that event. A second and more important sortie took place between Sept. 8, 9 and 13 and its beginning therefore coincided with the decisive day of the battle of the Marne.

Early in September the Belgian staff had information that the Germans intended to move the IX. Res. Corps and a division of the III. Res. Corps to France and to replace them by Marines and Landwehr troops. To prevent this the sortie was begun on Sept. 9 and again began successfully. Its effect was to cause the departure of the IX. Reserve Corps to be delayed, while that of the division of the III. Res. Corps was definitely cancelled. Further, a division of the XV. Corps on the way from Alsace to the extreme German right was diverted to Antwerp. These move-

ments checked the progress of the Belgians, who retired on Antwerp on the 13th, but the general effect of the sorties was to make the Germans feel that Antwerp was a thorn in their flank, which could not be neglected and from this second sortie may be dated the initiation of the German plans for the reduction of the Belgian fortress (see ANTWERP, SIEGE OF).

#### FIXING OF THE FIRST LINE: SEPT.-DEC. 1914

The German armies of the right, retreating from the Marne, stood behind the Aisne. The French re-occupied Amiens and Soissons on Sept. 13 and Reims on the 14th.

*The Race to the Sea.*—The battle of the Aisne then opened and while it was in progress there began that curious movement of both armies northwards which has been called the "Race to the Sea." During the advance to the Aisne Joffre had impressed upon Maunoury the importance of outflanking the German line and with this object the VI. Army began an attack on either bank of the Oise between Carlepoint and Noyon. This was checked by the timely arrival of the IX. Res. Corps from Belgium, and Joffre thereupon prepared for a new outflanking effort under a reconstituted II. Army commanded by Castelnau.

Between Sept. 22 and 24 Castelnau's attacks were stopped by the transfer of German troops from their left flank and the French line settled down into the beginnings of trench warfare through Lassigny, just east of Roye, through Chaulnes to a point on the Somme a few miles east of Bray. Joffre's third attempt to outflank his enemy consisted in the appointment of Foch to the general direction of the operations on the French left and the creation of a new X. Army under Gen. Maud'huy to operate north of the Somme as far as Arras. Maud'huy began his effort on Oct. 2, but so far from being able to turn the German flank he found himself struggling desperately to save Arras. For Falkenhayn had in his turn determined on a great effort to envelop the French and had assembled in Artois a VI. army composed of troops withdrawn from Alsace and Lorraine, where their places were taken by Landwehr. On the flank of the VI. Army eight German cavalry divisions under Von der Marwitz were to sweep across Flanders to the Belgian coast, while the siege of Antwerp was to be pressed to a conclusion.

The result of the collision between the French X. Army and the German VI. Army was to establish the Allied trench line during the first week of Oct., east of Albert, west of Bapaume, along the eastern outskirts of Arras, the western slopes of the Vimy ridge, of which the greater part remained in possession of the Germans, as did the mining towns of Lens and Loos. Meanwhile the German cavalry sweeping round northwards into Flanders had occupied Ypres and Bailleul and sent patrols through Hazebrouck, west of which they were checked by French cavalry supported by territorial infantry and by a brigade of British Marines, which had been landed at Dunkirk on the night of Sept. 19-20. A battalion of this brigade occupied Lille on Sept. 28 but was withdrawn on Oct. 1 to move with the remainder of the brigade to take part in the defence of Antwerp (see ANTWERP, SIEGE OF).

*British Reinforcements.*—Towards the end of Sept. the British Govt., anxious to do everything possible to save Antwerp, was, besides sending reinforcements directly to the Belgian fortress, preparing an expedition for the raising of the siege. This expedition, consisting of the 7th Regular Div. and 3rd Cav. Div.,<sup>1</sup> under Sir Henry Rawlinson, had landed at Zeebrugge on Oct. 6. Meanwhile Sir John French being desirous of regaining touch with the Channel coast and of shortening his line of communication, had suggested to Joffre at the end of Sept. that his army should resume its original position on the Allied left.

When the menace of the German enveloping movement had become clear, the original British bases at Havre and Boulogne had been abandoned, and had been transferred to St. Nazaire on the Atlantic. The British communications with the Atlantic

<sup>1</sup> The 6th Regular Div. had joined Sir John French on the Aisne, and the original cavalry division of the expeditionary force had been expanded into two.

were necessarily impeded by French cross traffic and it would be obviously desirable to reopen the original bases and establish freer and shorter lines of communication. Joffre accepted this view, the British trenches were gradually taken over by the French during the first fortnight of October, and the whole British Army was transferred to Flanders, arriving fortuitously in time to meet another great German attempt at envelopment. This movement was screened by the arrival near Béthune of the French XXI. Corps from the south, which pushed back the right of the German cavalry, only to be stopped in its turn near and south of La Bassée by the German XIV. Corps, which had come up from Metz.

*Retreat of the Belgians.*—Thus when the British II. Corps detrained at Abbeville on Oct. 8 and 9 the trench line had become stabilised as far to the north as the La Bassée canal. The first development of Falkenhayn's turning movement had been definitely checked and there seemed a reasonable prospect that the British Army arriving in Flanders in support of the French cavalry screen would succeed in overlapping the German right. While these movements were taking place, two events had materially altered the situation in Flanders. On Oct. 10 Antwerp capitulated and the greater part of the Belgian Army retreated along the west to take refuge behind the floods of the Yser valley which had been created by opening the dykes. Sir Henry Rawlinson's force being too late to assist in the defence of Antwerp, assisted in covering the retreat of the Belgians and moved through Bruges and Ghent towards Ypres, while in order to assist the Belgian Army further, a brigade of French Marines had occupied Dixmude.

On Oct. 13 the British 3rd Cav. Div. had re-occupied Ypres and on the same day the Belgian Govt. was transferred to Havre. On Oct. 13, too, Lille, which had been attacked by the Germans on Oct. 8, capitulated. On the day before the fall of Lille, Smith-Dorrien's II. Corps, swinging round with its right on Béthune, had begun to drive back the German cavalry towards the La Bassée-Lille road. By Oct. 17, with a French cavalry corps under General Conneau on its left, it had captured the villages of Herlies and Aubers on its left, and was approaching La Bassée with its right. It was then attacked by the right of the German VI. Army, which was constantly being extended as troops came up from Lorraine.

*British Advance.*—The British III. Corps under Gen. Pulteney, on its way northwards from the Aisne, had on Oct. 11 begun detraining at St. Omer and Hazebrouck and marched towards Bailleul; driving German cavalry supported by infantry detachments out of Meteren it captured Armentières on Oct. 16, but was unable to advance beyond the outskirts of that town. On Pulteney's left the British Cav. Corps under Allenby, which had marched from the Aisne and reached St. Pol on Oct. 9, moved thence northwards and pushing back German cavalry from the Southern Flanders ridges, occupied Mont des Cats, Mont Noir and the important hill of Kemmel, and obtained a footing on the Messines ridge. On Oct. 19 the I. British Corps under Sir Douglas Haig had concentrated at Hazebrouck, whence it marched towards Ypres and effected a junction east of that town with Rawlinson's force.

On Haig's left a new French VIII. Army under Gen. d'Urbal was coming into existence. This at first consisted only of the Marine brigade already mentioned, a cavalry corps under Gen. de Mitry, and two divisions of territorials, but it was rapidly reinforced. The general direction of the operations of the Allied left was in the hands of Foch, who acted as Joffre's representative. By Oct. 20 battle was joined along the whole front from La Bassée, along the Aubers ridge, just east of Armentières, along the Messines ridge, east of Ypres to Dixmude and thence to the sea near Nieuport. Towards this front both sides were hurrying reinforcements. The British Army was strengthened by the arrival of selected battalions of territorial infantry and of an army corps from India, composed of both British and Indian troops, while on the German side four Army-corps, created since the beginning of the War, were advancing from Brussels towards the Yser. In such circumstances, each side still hoping to be

able to outflank the other, the first battle of Ypres began (see YPRES, BATTLE OF).

*Position at End of 1914.*—With the close of that battle and the withdrawal by the Germans of troops for the Eastern front, they adopted perforce a defensive attitude along the whole front. For the Allies there followed necessarily some weeks of rest for the exhausted troops and a period during which the Franco-British forces, which had become much involved during the battle were sorted out. The result of these readjustments was that Haig's corps, withdrawn from Ypres, took over the La Bassée front with the Indian corps on its left; Pulteney's III. Corps still held the Armentières section, reinforced by the arrival of an 8th Regular Div. from England and Smith-Dorrien's II. Corps occupied the lines opposite the Messines ridge with its left fronting Wytshaete. Thence northwards, d'Urbal's VIII. Army held the Ypres salient, the Belgian army the line of the Yser and a French detachment watched the coast.

These arrangements completed, the Allied commanders-in-chief planned to take advantage of the weakening of the German armies in the West by endeavouring to penetrate the enemy's defences. There resulted a number of minor enterprises carried out by the French, mainly on the Lorraine front and by the British against the Messines ridge. These endeavours were entirely unsuccessful and served only to inform the Allied leaders that the problem of breaking through lines of trenches protected by barbed wire, defended by resolute men, equipped with quick-firing rifles and machine guns, and supported by modern artillery, was both formidable and new, and required a readjustment of all pre-conceived ideas of the methods of attack. It was in this atmosphere that the year 1914 closed on the Western front.

## II. TRENCH WARFARE, 1915-7

While weary British troops were handing over their lines in the salient to their French comrades at the close of the first battle of Ypres (see YPRES, BATTLE OF), and they had time to think of other things than the grim struggle that had just ended, it dawned upon them that the war in the west had entered upon a new phase. The trench barrier had been completed from the North Sea to the Swiss frontier, and a war of movement and manoeuvre, for which most of them had been trained, had become impossible. This was a development which had not been foreseen by the military world of Europe and it took it by surprise. For the Germans this surprise was less unpleasant in the winter of 1914-5 than for the French and the British. The fortifications of the French and Russian frontiers had compelled the Germans to study closely the art and science of siege warfare and to make preparations for such warfare. They had assimilated the experiences of the Russo-Japanese War and had learnt from them to their profit.

The British Army was in very different case. Its chiefs before the War believed that it would be employed only in a war of movement, and the study of siege warfare had been confined to a small body of engineers, amongst whom it was largely theoretical. All the money to be found for the Army Votes had been used in the training and equipment of the Expeditionary Force, and there was none left for the provision of the material required for the attack of fortresses. The cost even of hand grenades, with which experiments had been made when the reports of

British observers in Manchuria came home, was held to be prohibitive. For these reasons the winter of 1914-5 was for the British infantry in France and Flanders a period of unmitigated suffering.

*New Allied Plans.*—While the soldiers in front were enduring and slowly learning to mitigate the horrors of trench warfare, those behind were planning. There were not lacking active brains in Paris and in London who saw that the assaults upon the ever-widening barriers of barbed wire and the evermore serried lines of trenches must prove a slow and bloody business. These brains sought eagerly for a way round the barrier which would lead to a speedier and less costly victory, and so began the controversy between "Easterners" and "Westerners" which endured while the War lasted.

There were signs early in 1915 of preparation for an Austro-German attack upon Serbia; and Mr. Lloyd George, inspired by his friends in France, proposed at once to save a weak ally and to attack the weakest link in the opposing chain by transferring the bulk of the British army to the Balkans and reinforcing it with the new armies as they became ready for the field. Both the French and the British Commanders-in-Chief hotly opposed this proposal. The lines of communication through Serbia were long and difficult, and it was very doubtful whether they could be made to maintain an adequate force. The transference of the British army to the Balkans must in any event have taken many months, during which it would have been condemned to an inactivity from which the enemy on the inside of the circle, with not only shorter but better communications, would certainly have profited. The Balkan enterprise was therefore condemned, and the immediate outcome of the controversy on the British side was the starting of the Dardanelles adventure.

Joffre's plan was simpler. He desired to attack on the Western Front at the earliest possible moment and with all possible force. It was argued at the time, and has repeatedly been argued since, that it would have been better to have awaited the development of the British Army, the increase of the Allied artillery, the improvement of their stock of munitions and to have employed the interval in gaining advantages over less formidable foes in other theatres of war. To these arguments Joffre's answer was that the Germans were in occupation of a great part of France, that near Noyon they were only 50 m. from Paris, on the Somme they were barely 20 m. from Amiens, the main junction connecting the British and French in Flanders and Artois with the remainder of the French troops, while farther north they were little more than 40 m. from Calais. The French Commander-in-Chief maintained that the security of the Western Front must be a paramount consideration in Allied strategy, and that to secure the position in the West it was necessary to drive the Germans farther back.

#### EARLY BATTLES IN 1915

Sir John French was in general agreement with Joffre's views. He at first desired a combined naval and military attack upon the coast of Belgium, but on receiving representations from Lord Kitchener that neither the men nor the munitions required for this operation could be made ready in time, he abandoned this proposal and set himself whole-heartedly to co-operate in Joffre's plans. These plans comprised a grand attack by the British Army north of the La Bassée canal and by the French northern group of armies under Foch on the front between the La Bassée canal and Arras. The hope was that this attack would give the Allies the Vimy Ridge and compel the Germans to evacuate Lille. In order that Foch might have the forces necessary for such a battle it was agreed between the commanders-in-chief that the British should relieve the French troops, who had occupied the Ypres salient when Haig's men had been withdrawn from it after the first battle of Ypres. Sir John French had at the end of 1914 received one more regular British division, the 27th, made up by Kitchener from foreign garrisons, while another, the 28th, arrived early in January. The 1st Canadian Div. disembarked in France in the second week of February. This gave him a total of

12 infantry and five cavalry divisions, besides a number of selected territorial battalions. These reinforcements allowed him to form his command into two armies, the first under Sir Douglas Haig and the second under Sir Horace Smith-Dorrien, and at the same time to extend his front gradually north into the Ypres salient.

*Battle of Neuve Chapelle.*—The British Army, which like other European armies, had been trained to believe in the supreme virtue of attack, had since the beginning of the War, with the exception of the short period of the advance to the Marne and the Aisne, been compelled to fight defensively, and Sir John French desired to give it a wider experience of attack upon entrenchments. For this purpose he had been carefully saving up artillery ammunition by strictly limiting the amount to be expended in the routine of trench warfare, and he calculated that he would have sufficient at his disposal to allow him to engage in a considerable battle early in March. He entrusted the execution of this battle to Haig's I. Army, which was directed to attack the German lines near Neuve Chapelle, an operation which it was hoped would result in a favourable position for the further battle which was to be undertaken later in co-operation with Foch. The battle of Neuve Chapelle opened on March 10 with what was in those days held to be a very heavy bombardment. This bombardment was followed by an infantry assault, which was at first successful, and carried the village of Neuve Chapelle, but was soon brought to a standstill by the enemy's machine-guns. In this battle the British first experienced the difficulty of bringing up reserves at the right time through roads blocked by the debris of battle and over ground scarred by trenches and torn by shell-fire. On the whole, however, both the French and the British were impressed by the result of the bombardment, which was held to promise great things when there should be more guns and more ammunition. Preparations for further battles therefore went forward (*see NEUVE-CHAPELLE, BATTLE OF*).

The Germans, guessing what was on foot, were not slow to interfere with these preparations. On April 17 a portion of Smith-Dorrien's II. Army attacked and gained a footing upon Hill 60, an important feature on the south face of the Ypres salient. The Germans, counter-attacking, promptly regained possession of the hill and followed up this success by a far more serious enterprise on April 22. By then Foch's preparations for the attack on the Vimy Ridge were far advanced, and to obtain the troops he needed for the coming battle he had greatly weakened the French forces left in the north portion of the Ypres salient. Against this portion the Germans launched waves of poison gas discharged from cylinders, which completely overwhelmed the French troops, who had no protection against the gas. The flank of the 1st Canadian Div. was completely exposed, and for a short time a definite breach was created in the Allied line. Fortunately the Germans were unprepared for the extent of their success, and had not the troops at hand to take immediate advantage of it, while the gallantry of the first Canadian Div. and the 28th Div. held the enemy at bay until reinforcements could be brought up. The first complete British Territorial division to arrive in France, the 46th, North Midland Div., was fortunately in the neighbourhood, and these and other reinforcements, some contributed by Foch from the reserves he was holding in readiness for his battle, sufficed to save Ypres and to patch up a new line.

But the second battle of Ypres, if it did not give the Germans all the success they might have attained had they been ready to follow up the first success, at least gained a great part of their purpose by weakening the forces and exhausting the meagre supply of ammunition which the Allies were accumulating for their projected battle.

*Fromelles and Festubert.*—The battle began on May 9 with an attack by the British I. Army under Haig on either side of Fromelles, and an attack by d'Urbal's French I. Army, under the direction of Foch, on a much wider front which extended from the Scarpe to the north of the Souchez. The British attack made very little progress and it was soon evident that the

preliminary bombardment had not sufficed to destroy sufficiently the enemy's defences, or, what was of greater importance, to overcome his machine-guns. Sir John French, however, felt himself bound by his agreement with Joffre and Foch to keep the enemy occupied on his front as long as possible, and the battle of Fromelles became merged in the battle of Festubert, by bringing the front of attack slightly south into what it was hoped would prove more favourable ground.

The experience of Festubert was, however, hardly more favourable than that of Fromelles, for again the German machine-gunners checked all real progress, while the lack of artillery ammunition became more and more felt. The situation was made more difficult in this latter respect by renewed German attacks in the Ypres salient upon the II. Army, now under the command of Sir Herbert Plumer. The situation of the British Army in Flanders was somewhat eased by the arrival of five more divisions of territorials, followed by the first of the New Army divisions, the 9th, but it was lack of shell rather than lack of men which forced Sir John French to stop his attacks, and the battle of Festubert petered out on May 25th.

*French Successes.*—Meanwhile, on the British right, Foch was making encouraging if slow and very costly progress. In the battle of the Souchez the villages of Ablain St. Nazaire, Carency, Neuville St. Vaast and Thélus were carried by d'Urbal's men, who fought their way doggedly up the west slopes of the Vimy Ridge. The French found the German machine-guns to be the chief obstacle to progress and the prime cause of casualties, particularly in the villages, in which the enemy's machine-gunners fought indomitably from cellar to cellar and in a certain elaborate series of works which became known to fame as the Labyrinth. When the British ceased their attacks on May 25, Foch had made enough headway to encourage him to believe that he could gain the whole ridge, and he determined to continue the battle alone. But for this he wanted more troops, and an extension of the British front, which would set free Frenchmen, while both he and Joffre were fearful lest the new Army divisions preparing to leave England should be sent to the Dardanelles.

*British Front Extended.*—In May Joffre, therefore, wrote to Kitchener that he proposed to renew the attempts on the Arras front to take Vimy Ridge, while the British Army fought on Foch's left and he made his main attack in Champagne to the east of Reims. To obtain the French troops for this campaign he required the British Army to extend its front to the right and left, and also to relieve de Castelnau's VI. Army on the Somme front. The remainder of the summer was occupied by these changes, which became possible as the New Army divisions arrived from England. The 2nd and 3rd of these to reach France disembarked at the end of May, and six more before the end of July, so that by then the four divisions and the cavalry division of Mons had in 11 months increased to 28 divisions and five cavalry divisions. These reinforcements enabled a British III. Army to be formed under Sir Charles Monro, which took over some 17 m. of front from a point to the south of Arras as far as the Somme, eventually extending its lines to the south of that river. Haig's I. Army prolonged its right south of the La Bassée canal to the neighbourhood of Lens, and thus found itself facing the open plain of Loos, simultaneously the II. Army, now under Plumer, who had taken Smith-Dorrien's place, relieved the remaining French troops in the Ypres salient and brought its left into contact with the right of the Belgians.

#### THE AUTUMN CAMPAIGN OF 1915

While these movements were in progress, vast preparations were taking place on the battle-front. Guns, trench mortars, shells and military stores of all kinds had accumulated in hitherto undreamt-of quantities. Joffre and his staff had it in their minds at this time that they were engaged in operations in the nature of a huge siege, and the essential was to blow a practicable breach in the enemy's lines through which the infantry could be poured to the assault.

A study of the previous battles of trench warfare had con-

vinced them that with sufficient guns and sufficient ammunition this was possible. The output of the French factories had been increased enormously, and though the British Ministry of Munitions had hardly yet begun to be productive, still the supply of heavy guns and shells for the British Army had been greatly increased and it was equipped to reply effectively to the German gas. The one fly in the ointment was that there had been a renewal in the British Cabinet of the controversy between the "Easterners" and the "Westerners," and Mr. Churchill had pressed with all his eloquence and skill for a decisive campaign which should open the road to Constantinople. The result was a compromise, and three of the New Army divisions had gone to the East. Some compensation for this was obtained by the arrival of two more New Army divisions in France, and by the formation of a Guards' division, which had been made possible by the creation of new battalions of Guards and the replacement of those already in France by other battalions. This gave Sir John French an additional army corps, which he kept in his hands as a reserve.

*Allied Offensive in Champagne and Artois.*—Joffre opened his autumn campaign on Sept. 25. In addition to his great attack in Champagne, Foch with the French X. Army attempted once more to storm the Vimy Ridge, while Haig's I. Army attacked between the La Bassée canal and Lens, in conjunction with a secondary British attack to the north of the canal and demonstrations on the front near Armentières. The general plan of the north battle was that Foch, having carried the Vimy Ridge, should advance east to the south of Lens, while Haig pushed east through Loos to the north of Lens and joined hands with Foch beyond that town. In this way the Allies would avoid the mass of ruined buildings and miners' cottages which composed the town and would form admirable refuges for the German machine-gunners.

The tactical methods to be employed on both the south and north battlefields were similar in conception, that is to say, there was to be a great rush forward of the assaulting infantry as soon as the attack had been adequately prepared by the artillery, and the reserves were to follow hard after the first-line troops. Only in the matter of the preparation of the attack was there any essential difference in the methods to be employed by the British and the French. The former had determined to replace an intense bombardment by a discharge of gas from cylinders similar to that from which they had suffered in the second battle of Ypres.

Of the British share in the general plan, the demonstrations in front of Armentières proved quite ineffective, while the attack north of the La Bassée canal failed. On the front opposite Loos, however, the discharge of gas surprised the Germans and overcame the resistance of their first-line troops, though it caused some casualties among the British themselves and made it difficult to direct the attack. Despite this, the first wave of British infantry passed through and beyond Loos, when it appeared that they only needed the prompt arrival of the reserves to secure a very considerable success. Sir John French had, however, kept these back until he saw how the battle progressed, and when they arrived late in the evening the New Army divisions which formed two-thirds of the reserve found great difficulty in making their way through the confusion of the battlefield under conditions entirely strange to them, and were unable to confirm the first success won, so that, though Loos was held, German counter-attacks recovered a considerable part of the ground gained, and in particular the important Hill 70, which dominates Loos on the north (see LOOS, BATTLE OF).

Worse still, Foch's attack on the Vimy ridge failed almost completely, and the Germans remained in possession of the crest. This alone condemned the north attack to failure, for the British front of battle was not large enough to insure a breach in the enemy's defences sufficiently wide to be exploited successfully. The remainder of the battle of Loos, which lasted until Oct. 15, resolved itself into the repulse of a number of fierce German counter-attacks, which ended in

mutual exhaustion, with the British in possession of the salient extending round Loos to the La Bassée canal.

The great battle in Champagne was an even more severe disappointment because more had been expected. The first news from the field aroused high hopes. The first two German lines of defence were carried on a wide front, and many prisoners and guns were captured, while on the fourth day of the battle the third German line, which was believed to be the enemy's last system of defence, was for a time breached near Sainte Marie; but again the solution of the problem of bringing up reserves at the right time and in good order was not found, while the enemy's reserves, which came up fresh through country which had not been fought over, arrived in time to fill the breach. The battle of Champagne ran on into Nov., developing into a series of struggles for tactical points of importance, but ended with no material change in the position won by the French at the end of the fourth day of the battle.

So the campaign of 1915 closed on the Western Front, with the Allies still asking themselves how it was possible to get through the trench barrier and drive the Germans from France and Belgium. The great bombardment followed by the assault in mass had failed, and some other method of attack was required.

*Allied Organisation Revised.*—Ere the year closed a new problem had developed in the Near East which had its repercussion on the Western Front. German, Austrian and Bulgarian forces had overrun Serbia, and the Allied Governments had decided to send a relief expedition to Salonika. Part of the troops required for this new enterprise came from the Dardanelles, but more were needed and these had to be supplied from the Western Front. Five divisions of French troops under the command of Gen. Sarrail were ordered off and accompanied by the three British divisions of the III. Army which had been holding the line south of the Somme, the 27th, 28th and 22nd. It was also decided to spare the two divisions of Indian infantry, which had proved such a timely reinforcement at the time of the first battle of Ypres, the horrors of another winter of trench warfare in Flanders, and they were sent off to Mesopotamia.

This reduction of the British Army was made good by the arrival in France before the end of the year of the 2nd and 3rd Canadian Divs. and the 16th Irish Div., and of the 21st, 23rd, 24th, 25th, 26th, 36th and 38th New Army Divs., so that the strength of the British Army in France and Belgium stood at 36 divisions and five cavalry divisions. The Allies on the Western Front had therefore at this time about 3,100,000 men, opposed to 2,000,000 Germans. These figures gave rise to anxious discussion as to what superiority of numbers was necessary to ensure success under conditions of trench warfare, and whether and how the Allies could obtain the necessary superiority.

While these discussions were going on important changes took place in the Allied command. Joffre had hitherto been nominally chief of the French General Staff. He was now definitely appointed commander-in-chief of the armies of the northeast, with de Castelnau as his chief-of-staff. In the British Army Sir John French was brought home to command the troops in Great Britain and was succeeded by Sir Douglas Haig, with Gen. Kiggell as his chief-of-staff, while Sir William Robertson, who had been chief-of-staff to French, became Chief of the Imperial General Staff at the War Office.

#### OPERATIONS IN 1916

In Dec. 1915 the first serious attempts to obtain unity of action between the Allies took place, and a conference of commanders-in-chief and chiefs-of-staff of the British, French, Belgian and Italian Armies, attended also by representatives of the Russian and Japanese Armies, was held at Joffre's headquarters. At this conference it was agreed to attack the enemy as early in 1916 as possible, sufficient time being allowed for the training of the New Army divisions that the British Army was receiving, and for the re-equipment of the Russian armies. These plans, however,

never matured, because the enemy anticipated them, and it is therefore unnecessary to refer to them further.

During Dec. 1915 and Jan. 1916 the Germans developed considerable activity along the front and made local attacks at Nieuport on the North Sea coast, against more than one point in the Ypres salient, at Givenchy on the Vimy Ridge front, on the Somme, and in Feb. on the Alsace front. The majority of these attacks took the form of experiments in various methods of bombardment which the Germans wished to test in view of a greater effort which they were planning. That effort took the form of a great attack upon Verdun (*see VERDUN, BATTLE OF*) which began on Feb. 21.

Both commanders-in-chief were agreed that the principles on which the plans of battle in 1915 had been drawn up required modification. It was seen that the analogy of the great siege did not hold, that something more was required than to blast a great breach in the enemy's lines and then to launch a great assault. The something more was the defeat of the enemy's reserves, which came up fresh and in good order to meet troops when the assault had been thrown into some confusion. It was agreed, therefore, that the first object of battle should be to draw in and exhaust the enemy's reserves, and that until that object had been achieved no decisive success could be expected. So long as the enemy continued to attack Verdun, it would, on this principle, be to the advantage of the French to endure these attacks provided always that the enemy gained no success which would affect seriously the strategical position on the whole front, and provided that the exhaustion of the French man-power was not excessive.

Joffre therefore proposed to fight defensively at Verdun as long as possible, but to be ready to strike back as soon as the situation there appeared to him too dangerous, or as soon as the French Army was approaching the limits of endurance. He therefore asked Haig not only to relieve the French X. Army on the Arras front, but to prepare to attack north of the Somme on a front as wide as the resources of the British Army would permit, and undertook to support that attack with a French attack south of the river on a scale which would depend upon the effect of the battle of Verdun upon the French Army. (*See VERDUN, BATTLE OF.*)

*Battle of the Somme.*—Between Jan. and July the British strength in bayonets and sabres grew from 450,000 to 660,000, and there was a more than corresponding increase in artillery and aircraft. This enabled Haig to fall in completely with Joffre's wishes, and as soon as the relief of the French X. Army was completed he set about preparing for the great attack on the front north of the Somme. The growth of the armies made necessary the creation of a IV. Army under the command of Sir Henry Rawlinson. The III. Army was now commanded by Sir E. Allenby, and Sir Charles Monro, who had gone out to supervise the evacuation of the Dardanelles, returned to command the I. Army. British troops now held a continuous line from the Yser canal to the Somme, and were actively preparing to take upon themselves more of the brunt of the war on the Western Front, a burden of which nearly seven-eighths had hitherto fallen on their French comrades.

In the latter part of May the German Crown Prince redoubled his attacks on the Verdun front, and on the 21st the Germans stormed the Mort Homme hill on the left bank of the Meuse, for which they had been struggling for weeks. Pétain at once called Joffre's attention to the gravity of the situation, and pressed for an early beginning of the counter-offensive on the Somme, but Joffre was anxious to give Haig as much time as possible for the training of his troops, and made Pétain endure yet longer. Fire from the Mort Homme hill had long impeded German progress on the right bank of the Meuse, but with the hill in their possession the enemy in the beginning of June began to press hard on that bank and on the 7th captured Fort Vaux. Thereupon Pétain renewed his representation to Joffre, who in consultation with Haig decided that the battle of the Somme should begin on July 1. The preliminary bombardment was begun a week earlier, on June 24, the day on which the Ger-

mans, after capturing Fort Thiaumont, stormed the village of Fleury and attained the farthest point in their progress towards Verdun.

The battle was fought out in three phases, the first being the struggle up the slopes from the valleys of the Ancre and of the Somme to the south crest of the Somme plateau, the second the struggle for possession of the plateau, the third phase consisting of the advance down the north slopes. The first phase was consummated by a brilliant night attack by the IV. Army on July 14, and on July 17 the British and French troops north of the river were abreast of the French south of the Somme, the French having for some time been established opposite to Péronne. The whole front of attack could again move forward together. The second phase constituted a long series of fierce struggles, the Germans bringing up more and more troops and disputing every yard of ground, so it was not until Sept. 9 that the British, with the French on their right, were able to look down upon the north slopes of the plateau and the plains beyond.

*Progress of the Battle.*—By this time two of the objects for which the battle had been fought were gained. The Germans, forced to transfer troops to the Somme, had to relax their pressure on Verdun. The French retook Fort Thiaumont on June 30, while throughout July they slowly regained part of the ground which had been won from them, and on Aug. 17 drove the enemy out of Fleury. Verdun was no longer in danger, and Pétain and Nivelle were able to plan at leisure counter-attacks on a more extensive scale. The second object of the battle of the Somme, the exhaustion of the enemy's reserves, was being obtained as surely. When the battle began, the front attacked by the British was held by six German divisions, that attacked by the French by two. In the two months 36 German divisions had been engaged on the British front, 18 on the French. In the six months of Verdun the Germans had employed 43 divisions in battle, so that their defence on the Somme was far more exhausting than their attacks at Verdun.

At the end of Aug. the failure of Falkenhayn's plans was publicly admitted by his supersession by Hindenburg, with Ludendorff as his chief assistant. The latter, after visiting the fields of Verdun and the Somme, found the German position on the Western Front to be one of great gravity, and the chief problem confronting him to be how to stop "the progressive falling off" of the German fighting power. The situation of the Allies had improved marvellously since June, when men were wondering how long it would be before the Germans entered Verdun. Not only had Verdun been saved and the Germans been forced to fight desperately on the defensive, but the Italians had driven back the attacking Austrians in the Alps and had then passed themselves to attack on the Isonzo. On the Russian front Brusilov had won great victories on the Bukovina and Rumania had entered the war, too late certainly to profit by Brusilov's success, but none the less adding apparently another ally to those who confronted the Central Powers. The whole machinery of the Allies was, for the first time, simultaneously at work, and Joffre's strategy appeared to be triumphant.

It was in these encouraging circumstances that the third phase of the battle of the Somme began on Sept. 15. The attack of that day was made famous not only by the successes won, which were considerable, but by the fact that tanks then made their first appearance in battle.

Despite the employment of tanks, and despite the splendid valour of the infantry of the New Armies, the resistance of the enemy was not broken in the third phase of the battle of the Somme. The days were growing shorter and the weather became uncertain, while the enemy, drawing troops from all parts of the front to prevent his line from breaking, fought with fine courage. By Nov. 17, when rain and mud put an end to the battle, the Germans had engaged no less than 127 divisions. The enemy's reserves had indeed been worn down; in the valley of the Ancre he was hemmed by Gough's V. Army into an awkward salient, but the weather had broken and it was too late to reap the harvest on the battle-front. The first fruits of the Somme were garnered elsewhere.

*The Nivelle Method.*—On Oct. 24 Nivelle began an attack on the right bank of the Meuse, and on the following day recaptured Fort Douaumont. This conspicuous success was followed by the recapture of Fort Vaux on Nov. 2. The battle ended in a complete victory for the French, six French divisions overcoming seven German divisions at surprisingly small cost. Nivelle and Mangin, who commanded the army corps engaged, became the heroes of France. The victory was largely due to the skillful handling of massed artillery, and the Nivelle method became famous. Its fame was extended when, on Dec. 14, a second attack won an even more brilliant success, which made Verdun quite secure and brought in 11,387 prisoners and 115 guns, again at small cost.

When the statesmen of Paris and London compared the results of these two battles at Verdun, which had resulted not only in important gains of ground but in the capture in a few days' fighting of more than 17,000 prisoners, with the slow bludgeon work of the Somme in which the British Army in four and a half months had captured 38,000 Germans at a tremendous price, they began to think that they had at last discovered the man for whom they were looking so anxiously.

#### OPERATIONS IN 1917

On Nov. 11 1916 Joffre assembled his second conference of commanders-in-chief to consider plans for the following year. It was agreed that the Germans were in great difficulties on the Western Front, and that the situation of the Allies was more favourable than it had ever been.

*Strength of the Allies.*—The fighting strength of the British Army had grown to about 1,200,000 men, and it was known that considerable further reinforcements would reach France during the first few months of the year. The fighting strength of the French Army had been increased by the incorporation of native troops to about 2,600,000, so that, including the Belgians, the Allies disposed of about 3,900,000 men against about 2,500,000 Germans.

Joffre declared that the French Army could maintain its strength for one more great battle, but that thereafter it must progressively decline, as France had no longer a sufficient number of men of military age to replace losses. He therefore warned Sir Douglas Haig that during the coming year the burden must fall more and more upon the British Army, a position which the British commander-in-chief readily accepted. Germany had recently created a number of new divisions, some of which had been employed against Rumania, but it appeared probable that the transfer of these divisions to the Western Front would be delayed if Russia was able to be active on the Eastern Front, and of this the great improvement in the supply of munitions for the Russian Army held out promise at this time. It was also agreed that, in view of the probable decline in strength of the French Army later in the year and the promised reinforcement of the British Army, the relative superiority of the Allies on the Western Front would be greater in the spring of 1917 than at any time which could be foreseen with certainty.

*Foundations of the 1917 Offensive.*—For all these reasons it was decided to take the earliest possible opportunity of pressing the advantage won by the battle of the Somme, and of continuing the process of exhausting the enemy's reserves as preparation for an effort which should be decisive. All the armies of the Entente were to be ready to attack in the first fortnight of Feb., the British Army between the Vimy Ridge and Bapaume, the French armies between the Somme and the Oise; and the French attack was to be followed soon after by another in Champagne to the west of Reims. It was further understood between Joffre and Haig that these attacks would, if necessary, be followed by further attacks by the British Army in Flanders. During the winter the British Army was to do its utmost to press the enemy on the Somme battlefield, and to prevent him from recovering from his embarrassment there.

The underlying ideas of this plan were primarily that the policy of exhausting the German reserves should be resumed at the earliest possible moment, and secondly that the utmost effort should

be made to complete the work begun on the Somme. The commanders-in-chief believed the situation to be such that victory could be won in 1917, but they were under no illusion as to the possibility of ending the War by one great blow, to be delivered in the spring. Joffre followed up the results of this conference by issuing general instructions embodying the decisions reached, and in these instructions he directed that the first British and French attacks, that is to say, those to be delivered between Vimy and Bapaume and between the Somme and the Oise, were to be ready by Feb. 1.

*Nivelle in Command.*—No sooner were Joffre's plans completed than a series of intrigues against the French commander-in-chief came to a head. A number of officers of the French General Staff regarded with dismay a proposal to give more and more of the task of consummating victory to the British Army and less and less to the French. They found many supporters among the politicians in Paris, and these were reinforced by others, who feared that the "war of exhaustion" and the process of wearing down the enemy's reserves would end in exhausting France before it exhausted Germany. The cry therefore went up that it was time to have a change in the higher command. Foch, whose bloody assaults upon the Vimy Ridge had not been forgotten, was held to be too much of a "hammer and tongs" fighter, and he was placed on half-pay, while the state of the defences of Verdun before the German attack began was brought up against Joffre. So he was given a marshal's baton, and an honorific position in Paris and Nivelle reigned in his stead.

The new commander-in-chief at once made a drastic change in Joffre's policy and plans. He proposed to increase the weight of the French attack, and in order that he might obtain the French troops necessary he asked that the British should relieve the French VI. and XX. Armies and extend their front south across the Somme as far as the Amiens-Roye road. In return he suggested that Haig should modify his plans for keeping up the pressure on the Germans on the Somme battlefield during the winter, and that the date of the combined attacks should be postponed until March 15.

This meant a delay of six weeks in launching the attacks planned by Joffre, and the enemy would be given time to recover from the effects of the Somme. But it became clear, as Nivelle's plans developed, that there was to be an even more complete change of plan than this. He proposed to apply on a great scale the methods he had employed with such success at Verdun, and to return to the policy which had been discarded after the failure in Champagne in 1915. He intended, by skilful employment of a great mass of artillery, to overcome the enemy's resistance in his front lines, and then to pour in to the assault a great reserve which should break through the trench barrier completely and so change the whole strategical position on the Western Front.

*Allies' Mistaken Policy.*—Early in Dec. 1916, there had been a change of Government in Great Britain, and Mr. Lloyd George had become Prime Minister. He had made up his mind that the Somme had been a costly failure, and was eagerly looking for some method of winning the War which should be speedier and less costly in life than that of a "war of exhaustion." He therefore welcomed a general who promised a short, sharp and decisive battle, which would be over, one way or the other, within a comparatively short time. So at a conference held at Calais at the end of Feb. 1917, it was agreed between the British and French Governments that the British Army should be placed under the general direction of Nivelle for the forthcoming operations.

This decision violated a fundamental principle of military organisation. A general of a division is not, while still in command of his division, placed also in command of an army corps which includes other divisions, for the good and sufficient reason that if his attention is absorbed by the details of one unit or of one part of the front, he cannot simultaneously give proper attention to the other units or to other parts of the front. The right course would have been to have given Nivelle the general charge of the whole Western Front and to have appointed another commander-in-chief for the French Army. The results of this mistake soon became apparent. On the last day of the Calais

Conference news arrived from the British V. Army that there were signs of a German withdrawal in the valley of the Ancre. Some time before, the British airmen had discovered that a great new system of defensive works had been constructed by the enemy covering Douai, Cambrai and St. Quentin, the system which became known to the Allies as the Hindenburg line; and not long after the report from the Ancre came in there were indications that the Germans were preparing to retire from the whole of the Somme battlefield into this line. But Nivelle, not being in close touch with happenings on the British front, did not believe in a German retreat, and issued to Haig orders which were not compatible with the changed situation, and in certain matters went far beyond the agreement reached in Calais. This led to friction, which was adjusted at a further conference in London. By then it had become apparent that the Germans were in retreat on the whole front between Arras and the Aisne near Vailly.

*German Retreat to the Hindenburg Line.*—The Germans, relieved from pressure on their front during the winter, had prepared for their retreat systematically and brutally. The whole country which had been in their occupation west of the Hindenburg line was devastated, villages were burnt, roads and railways destroyed, fruit trees cut down and everything of any value was removed and mines which exploded at a touch were prepared with diabolical ingenuity. In these circumstances a rapid pursuit became impossible and the Germans were able to delay the advance of the Allies by rearguards, while they removed their heavy artillery and established their main bodies in the Hindenburg lines.

This manoeuvre, planned and successfully carried through by Ludendorff, who with Hindenburg as his chief had succeeded Falkenhayn in Sept. 1916 when the failure of the latter's attack on Verdun had become obvious, effected a great change in the situation to the benefit of the Germans. Not only did it materially shorten their front and thereby enable them to increase their reserves, but their troops exchanged the battered defences of the Somme battlefield with its awkward salients for the strongest lines which had yet been built upon the Western Front. Further, the enemy had withdrawn from a considerable part of the front which Nivelle had intended to attack, and this made necessary a further postponement of his battles, but he still adhered to the main features of his plan. In the altered circumstances grave doubts arose in the minds of some of the senior French generals as to the feasibility of this plan, and when these came to the ears of the French War Minister, M. Painlevé, he assembled a council of war on April 6, on the very eve of the offensive, at which criticisms of the plan were presented by certain of the commanders who were to take a leading part in its execution. Nevertheless, the French Govt. decided not to interfere with Gen. Nivelle.

*The Spring Offensive.*—It is difficult to conceive of a more unfortunate prelude to a great battle. However, these doubts and hesitations of the leaders were not known to the rank and file of the army or to the French people; and when, on April 9, the spring campaign began by an attack by Allenby's III. Army on the enemy's lines east of Arras, and by the Canadian Corps with one brigade of the 5th Div. on the Vimy Ridge, and met with an immediate success, hopes soared high. The French public was deeply impressed by the rapid capture of the Vimy Ridge, which had for so long resisted Foch's attacks, and great things were expected when the French Army advanced.

The second of Nivelle's blows was delivered by the group of armies of the centre, now under Franchet d'Espérey, against the German front in the neighbourhood of St. Quentin; but Franchet d'Espérey was here in contact with a part of the main Hindenburg line, and he had neither the time nor the means to prepare effectively for an attack upon their formidable defences. The operations of the centre group of armies, which had been intended to be an important part of Nivelle's programme dwindled therefore into little more than a demonstration, which took place on April 14 and had no material results. Nivelle's main battle, which took place on the front between Reims and Anizy, began on April 16. It had been planned that the assaulting

troops should, on the first day of battle, break through the first three German lines. The attack was made by Mangin's VI. Army and Mazel's V. Army, with Duchesne's X. Army and a mass of cavalry in reserve ready to exploit their success. Anthoine's IV. Army struck in to the east of Reims on the 17th. The left of Mazel's attack failed almost entirely; and elsewhere, though the first German line was captured, little progress was made beyond it. The dream of a rapid rupture of the enemy's front had to be abandoned, and a fresh plan of battle had to be formed.

One of the first results of the failure of Nivelle to realise his hopes was that he had to request Haig to press his attacks to the east of Arras with all possible vigour, so as to keep the largest possible number of Germans occupied in that quarter. This entailed a prolongation of the battle of Arras into a period when gains became small and were only purchased at great price. None the less Haig decided that the situation made it necessary to support the French with all his power, and he fought on till May 17, by which time the British Front was established some four miles to the east of Arras and in the plain to the east of the Vimy Ridge.

While Haig was thus battling in the north, Nivelle on the Aisne Front had brought his X. Army into his front line, and by slow and bitter fighting had won his way up the Chemin des Dames Ridge, of which he captured the eastern portion. Early in May it was quite evident that there was no prospect of such a break through as had been planned, and on the 15th the French Govt. replaced Nivelle by Gen. Pétain, while Gen. Foch, recalled from semi-retirement, became Chief-of-Staff in Paris. Pétain's first task was to wind up the operations on the Aisne front, and the battle ended definitely on May 20.

The immediate consequence of this repulse was the outbreak of a series of mutinies in the French Armies, which so affected the morale of the French troops that Pétain found it necessary to appeal to Haig to keep the enemy engaged while he restored the confidence of his men.

*Battle of Messines.*—If the attention of the Germans was to be occupied by the British armies it was necessary that they should be forced to fight. Upon any part of the British front south of the point where it bends south from the Belgian frontier north-west of Lille it was possible for the Germans to repeat their manoeuvre of March and avoid a battle by retiring into another system of defences, for in doing this they would be merely abandoning a portion of French territory which was of no great value to them, while they might by this method economise sufficient troops to enable them to fall upon the French. On the Belgian front they could not fall back without risking their hold upon the ports of Ostend and Zeebrugge, which were to them important bases for their submarine campaign, and without endangering the security of the chief aerodromes from which their air attacks upon England were made.

For these reasons Haig decided to press the enemy with all his available means upon the Belgian front, and on June 7 he began this campaign with the battle of Messines. This battle was most skilfully and thoroughly prepared by Sir Herbert Plumer, and was fought and won by his II. Army. The battle began with the explosion of a number of huge mines, the secret of which had been preserved by constant and devoted watchfulness on the part of the miners, who had tunnelled beneath the enemy's lines many months previously and awaited patiently the opportunity for their use. The effect of these explosions, combined with a very skilfully planned bombardment of massed guns of all calibres, was such that, except on the right of the attack in the neighbourhood of Messines, the infantry, for once, had little to do. The whole of the Messines-Wytschaete ridge was captured at comparatively very light cost, and the Ypres salient, a name of ill omen for the British army since Oct. 1914, disappeared.

The strength of the British army in combatant troops was now at its greatest. Haig had 64 divisions and ten cavalry divisions under his orders, and a mass of heavy artillery, tanks and aeroplanes. It was well that this was so, for the army was to be called

upon to endure greatly while Pétain and his men got their second wind. Nor was it only the situation on the Western Front which called for resolute action, for the condition of the Russian Army was far more critical than that of the French Army. Kornilov had, on July 1, begun an offensive, and if he was supported and encouraged by success in the west it was still possible that the Russians might continue to be a powerful factor in the War.

*Third Battle of Ypres.*—With these heavy responsibilities on his shoulders, Haig began on July 31 the third battle of Ypres, with a great attack by the V. Army, which had been moved north for the purpose.

As in the case of the battle of the Somme, the first fruits of the third battle of Ypres were reaped elsewhere than on the battle front. The Germans, forced to send more and more troops into the fiery furnace which blazed on the Ypres ridges, were compelled to leave the French alone, and Pétain had time to restore the confidence of his army. Part of his method was the delivery of very carefully prepared attacks on a comparatively small front, supported by a great mass of artillery which should leave the infantry little more to do than to occupy the ground won. The first of these attacks was delivered by Guillaumat's II. Army on the Verdun Front, and was completely successful, ending with the French in possession of all the ground which the Germans had won in six months fighting in 1916. This was followed by a more important attack delivered on Oct. 23 by Maistre's VI. Army, which gave the French the whole of the Chemin des Dames ridge, and resulted in the capture of 11,000 prisoners and 200 guns. Then and not till then Pétain expressed himself as satisfied that his immediate purpose was achieved.

The British troops, struggling in the mud of Flanders, could not be told the reasons which had called for a supreme effort from them and the terrible struggle through the mud, unrelieved by any conspicuous success, was a heavy strain upon them. As events turned out it would probably have been wiser to have brought the third battle of Ypres to a close immediately after the French had won the Chemin des Dames, but at that time the British were within a short distance of the crest of the Passchendaele ridge, while information received at G.H.Q. showed that the strain upon the German Army had been far greater, and that there had been a very appreciable lowering of the morale of the German troops.

Haig had yet another blow in preparation. The continued bad weather and the slowness of the progress had caused the abandonment of the project of landing on the Belgian coast, and all hope of driving the Germans from the Belgian ports had gone, but there still appeared to be an opportunity of profiting from the exhaustion of the German reserves before the winter gave them a period for recovery, as it had after the battle of the Somme. A final reason for continuing the struggle was that on Oct. 24 an Austro-German attack had been launched in Italy and at Caporetto had broken through the Italian lines. It was therefore of importance to keep up the pressure upon the Germans on the Western Front. So the third battle of Ypres was continued, until the ridge and village of Passchendaele were captured on Nov. 3.

*British Tanks at Cambrai.*—A fortnight later Byng's III. Army attacked the German front opposite Cambrai. This battle opened a new era in trench warfare. One of the outstanding difficulties which the trench barrier had created was that it had hitherto eliminated one of the chief resources of generalship, surprise. The time and labour required to prepare for a great bombardment, and the accumulation of the huge stores of material of war on the selected front of battle, made it impossible to conceal intentions from the enemy. But at Cambrai these difficulties were overcome by using a great number of tanks, brought up secretly to take the place of the bombardment in breaking the enemy's defences (*see CAMBRAI, BATTLE OF*).

The attack was made upon one of the strongest parts of the Hindenburg system, but the tanks successfully broke through, and the surprise was complete. At Messines the guns had left nothing for the tanks to do, and in the third battle of Ypres they

had been defeated by the mud of Flanders, but at Cambrai they came into their own. One thing alone was lacking as far as their part in the battle went. The co-operation between the tanks and the artillery in the later stages of the attack was not complete, so that numbers of tanks fell easy victims to the German guns, a lesson of which advantage was taken in 1918.

Of greater importance was the fact that six French and five British divisions had been transferred to Italy to help the Italian army to stem the disaster of Caporetto, so that Haig had not the troops to complete and extend the first successes won at Cambrai. It is a typical illustration of the advantage which their central position conferred upon the Germans that several of the British divisions which would have been invaluable at Cambrai had not reached the Italian front at the time when the Austro-Germans were checked on the Piave and the battle of Caporetto came to an end. So the German counter-attacks won back a good part of the ground which Byng had gained in the first advance, and the battle of Cambrai ended on Dec. 7 in one more disappointment for the Allies.

*Lessons of 1917.*—The campaign of 1917 on the Western Front had been fatally hampered by the change of plan which had been made by Nivelle when he succeeded Joffre. That change had permitted Ludendorff to prepare for and carry through the retreat into the Hindenburg line, and had postponed the date of the Allied offensive from Feb. 1, the date fixed by Joffre, until April 9—a delay of nine precious weeks. As Joffre had anticipated, it had been necessary for the British Army to bear the brunt of the fighting, but it would have done so under very different conditions if the Germans had been hustled back into the Hindenburg line, as they were in Sept. 1918, and if Messines had been fought at the beginning of April, and the third battle of Ypres had begun on May 30 instead of July 31.

The battle of Cambrai might then have synchronised with the last offensive of the Russian Army, and the combined effect might well have saved that army from dissolution, for adequate French and British reserves would have been available in France to support Byng's attack, and the War might have ended victoriously in the autumn of 1917. As it was, the battles of 1917 showed clearly that the solution of the problems of trench warfare at which Haig and Joffre had arrived was correct. It was first necessary to exhaust the German reserves and then to strike a surprise blow or series of surprise blows. Cambrai had shown how surprise might be achieved. But all this experience, which had been purchased at great cost, had been acquired too late to be put to profit in 1917, owing to the fatal delay in opening the campaign of that year.

### III. THE WESTERN FRONT IN 1918

In the latter half of 1917 there had been numerous discussions between the Allied statesmen and generals with the object of finding some effective means of co-ordinating their efforts, more especially in the military sphere.

#### THE SUPREME WAR COUNCIL

Up to the time of the crisis created by the defeat of the Italian armies at Caporetto these discussions had produced no result, but one effect of that crisis was the assembly of an Allied Conference at Rapallo, where on Nov. 9 it was decided to create a Supreme War Council of the chief Allied ministers, with headquarters at Versailles. Permanent military representatives of the chief Allied Powers were appointed to assist this council in the preparation of plans of campaign, Gen. Weygand being the French representative, Gen. Sir Henry Wilson the British, Gen. Bliss the American and Gen. Cadorna the Italian.

Before the creation of the Supreme War Council numerous conferences of the Allied ministers had been held to deal with problems as they arose, but there had been no international body charged with the preparation of questions for consideration by such conferences or with supervising the execution of the policy agreed upon. The establishment at Versailles of an international secretariat therefore supplied a need which had long been felt and was a great step forward in securing co-operation in the many spheres in which the Allies had been to a considerable extent competitors. It did not, however, solve the vexed question of the unity of military command, for the military representatives were not members of the Supreme Council, and were advisers only without any executive authority.

*Situation in Early 1918.*—The first great task before the Supreme Council was the consideration of the plans of campaign for 1918. The situation was serious. The collapse of the Russian Army was complete and on Dec. 22 peace negotiations between Russia and Germany had begun at Brest-Litovsk. For some time past German divisions from the Eastern Front had been arriving in France and Belgium and it was certain that many more would follow. At the beginning of 1917 there had been on the Western Front 170 British, French and Belgian divisions and by March of that year this number had been increased to 178 owing to the arrival of six British and two Portuguese divisions. These had been opposed to 129 German divisions. During 1917 six French and five British divisions had gone to Italy, and four French divisions had been broken up owing to lack of men to maintain them.

As against this decrease in the Allied strength the French had dismounted part of their cavalry and created one infantry division with the men so obtained, while  $4\frac{1}{2}$  American divisions had arrived. Therefore the Allied strength had fallen from 178 divisions to 168 $\frac{1}{2}$ , a decrease of 9 $\frac{1}{2}$  divisions. At the end of Jan. 1918 the German divisions had increased in numbers to 177, a reinforcement of 48 divisions as compared with 1917, thus making a balance in favour of the Germans of 54 $\frac{1}{2}$  divisions. This change in the situation was the more formidable because it was calculated that the Germans could bring another 30 divisions to the West, while the Portuguese divisions were of uncertain quality and it would be some months before the American divisions would be sufficiently trained to take a full share with their Allies.

The entry of the United States into the War had more than compensated for the defection of Russia and had given the Allies an invaluable naval reinforcement together with equally valuable financial aid, but it was calculated that American military strength, which took longer to develop, would not restore the balance in favour of the Allies before the late summer, and that the intervening period would be one of danger on the Western Front. France had no longer the men to replace her losses and Pétain, the French commander-in-chief, had been compelled to reduce the number of battalions in his divisions from 12 to nine. There were no more divisions to come from England and Haig, owing to lack of drafts, was compelled to follow Pétain's example and reduce the infantry in his divisions to a similar extent. This reduction was offset by a corresponding reduction in the infantry of the German divisions, but in view of the number of the latter, which might be expected on the Western Front, it was more than probable that the Germans for the first time since 1914 would be in a numerical superiority.

It was in these circumstances that the Supreme War Council met at the end of January. It was then clearly necessary to prepare for the possibility of a great German attack. While most of the German divisions coming from the East were being assembled opposite the British front and there were definite signs of military preparation in the neighbourhood of Cambrai, it was far from certain that the main effort of the Germans would be made in that part. It might be decided further to the south against the French or even against the Italians. In such circumstances any one of the Allied commanders-in-chief might if a neighbour were attacked be in legitimate doubt whether such attack were not a feint preparatory to a more formidable effort against him-

self. Some superior authority was therefore required to supervise the whole field of operations and to allocate reserves as and when required.

*The Military Executive Committee.*—The military representatives could not fulfil the functions of such an authority, as they were without executive power, and therefore after prolonged discussion the Supreme War Council decided to turn the military representatives into a military executive committee with Gen. Foch, then chief of the French general staff in Paris, as its chairman. The function of this committee was to create an Allied general reserve, to determine the location of that reserve and to issue orders for its employment. Opinion was not yet ripe for the creation of a generalissimo and the decision actually reached was a compromise between a number of proposals.

Compromises are rarely effective in war, and this was no exception. The exercise of military command by a committee is always objectionable, for a committee is constitutionally prone to discussions and is therefore very rarely able to act with that promptness which the exigencies of a military situation usually require. Further the committee was the less likely to be prompt in its decisions, because it was located at Versailles and could only obtain information from the front through the medium of the commanders-in-chief. The arrangement, far from unifying command, made it more complicated, in that it left the British and French commanders-in-chief in control of the greater part of their armies, while taking from them that part which was to constitute the general reserve and placing it under an independent body.

*Further Unsatisfactory Compromises.*—Nor was this the only decision of the Supreme War Council which resulted in an unsatisfactory compromise. Reinforcements, apart from American troops, could only be obtained for the Western Front by withdrawing troops, mainly British, from Italy, Salonika and Palestine. But the Italian statesmen would not consent to any weakening of the Allied contingents on their front, the French statesmen were as strongly opposed to any reduction of the forces at Salonika, while the British ministers were eager to extend the success which Gen. Allenby had won in capturing Jerusalem, by an offensive campaign against the Turks. The Allied chiefs of the staff had agreed at a preliminary conference to recommend to the Supreme Council that a defensive attitude should be adopted in other theatres of war and that all troops not absolutely required for defence in those theatres should be transferred to the Western front.

This recommendation was referred to the military representatives, who reported that the offensive campaign in Palestine should take place provided the Western front was made safe. They did not, however, add their opinion as to the number of troops required to make the Western front safe. The discussion turned on the latter point. The British Prime Minister believed that the experience of the War had shown that the lines of trenches on the Western front were impregnable and that the right policy was to act defensively in France and Belgium, await the arrival of the Americans with a view to a decisive campaign in 1919 and in the meanwhile to take the offensive in Palestine. Finally M. Clemenceau, the French Prime Minister, agreed to the offensive campaign in Palestine on the understanding that no reinforcements should be taken from the Western Front.

Thus the conference closed without making any provision for strengthening the Western front. The sequel was even less satisfactory. M. Clemenceau had brought great pressure to bear on the British Govt. to have the British front in France extended to compensate for the reduction of the French Army. Despite Sir Douglas Haig's protests, made in view of the fact that the Germans were massing opposite his front, he was compelled to extend his right as far South as the Oise, the new front being taken up by the British V. Army under Gen. Gough.

Meantime the Military Executive Committee had reported that it required a general reserve of 30 divisions from the British, French and Italian Armies and to this number the British contribution was to be seven. To the request for this number of divisions Haig replied that in view of the extension of his front and

of the steady increase in the number of German divisions, which by the first week in March amounted to 190, he could spare no troops. At a meeting of the Supreme War Council held in London on March 14, the formation of the general reserve was postponed and a week later the great German attack began. One result of these controversies was that the British chief of the staff, Sir W. Robertson, who had been unable to agree with his Government as to the creation of the military executive committee and the offensive campaign in Palestine, was removed from his position and his place was taken by Sir Henry Wilson, Sir Henry Rawlinson becoming military representative at Versailles.

#### THE GERMAN OFFENSIVE OF 1918

The change in the military situation in favour of Germany, brought about by the collapse of Russia and the victory of Caporetto, had towards the end of 1917 encouraged Ludendorff to believe that there was a prospect of winning the War by a decisive victory in the West. He tells us in *My War Memories* that he regarded the situation at that time as favourable in every theatre of war save in Asia, and he held the reverses which the Turks had suffered as of secondary importance. In his report to the Kaiser on Feb. 13 1918, he said:

The battle in the West which the year 1918 will bring presents the biggest military problem ever set before an army. France and England have grappled with it in vain for two years. . . . It must not be imagined that we are going to have another such offensive as in Galicia or Italy. It will be a stupendous struggle, beginning in one place and continuing in another and will take up a long time (see GERMAN OFFENSIVE).

*Ludendorff's Problem.*—The first question then to be settled was where the battle should be begun. The advantages of starting with an attack on the French were considered and dismissed because it was believed that such an attack would be answered by a British attack in Flanders, while it was held that exhaustion of French man-power would prevent France from undertaking an offensive on a large scale. Next the strategical situation of the British Army was considered to be less favourable than that of the French, for its lines ran parallel to and at no great distance from the coast of the Channel and any considerable break through the British front would at once make the position of Haig's troops precarious. On the other hand the French Army with more room to manoeuvre might recover from an initial reverse.

It was also the general opinion at German headquarters that the British Army, now almost entirely composed of troops raised since the beginning of the War, had shown itself to be less capable of battle manoeuvre than the French, and that once it was driven from its main defensive lines it would prove an easy victim. Finally Great Britain was regarded as the main prop of the Allies. A somewhat exaggerated view of the privations which unrestricted U-boat warfare were causing in England prevailed and Lord Lansdowne's suggestions for a peace by arrangement were known. It was confidently believed that, if to the threat of starvation could be added a severe defeat of the British Army in France, Mr. Lloyd George's determination to continue the War would be broken and the views of the peace party in Great Britain be made to prevail. On all these grounds it was decided to make the first effort against the British.

*Selection of the Point of Attack.*—The next question was to choose the part of the British front to be attacked. Prince Rupprecht of Bavaria, who commanded the group of armies on the northern part of the British front, strongly urged an attack on the Armentières-La Bassée front on the grounds that the British would certainly prepare for a renewal of the attack to secure the submarine bases on the Belgian coast, that therefore the British reserves would be massed in Flanders and that such an attack would lead most speedily to the desired object, a war of movement against the British reserves.

There was also the advantage that in Flanders the British lines were nearer to the coast than elsewhere and that a break through there would cause greater embarrassment than on any other part of the front. The objection to this plan was that

the ground in the valley of the Lys, always water-logged during the winter, would not be in a fit state for active operations until about the middle of April. Now, as in 1914, time was a vital factor in the German plans. Then the object had been to defeat the French before the Russians could develop a dangerous offensive. Now the object was to defeat the French and British before the American Army could become a decisive factor in the situation.

*German Opinions on United States.*—The views held at German headquarters during the winter of 1917-8 on the military effort of the United States were:—

The United States are forming an army of about 50 divisions of which three only have as yet landed in France. One of them is at the front to be trained. The two others are in need of more training behind the front. By the spring of 1918 the American forces in France may reach a strength of about 15 divisions. The mass of the divisions will only be suitable for use on quiet fronts. Only the three divisions now in France may be expected to take part in a spring offensive. The corps of officers is not yet trained for war on a large scale. On these grounds, the independent use of large American units in difficult positions will be out of the question at present. The drafting of reserves and the arming and equipment of the American troops are good. Training is still inadequate. But the first regiment put in at the front fought well during a German attack and it is therefore to be expected that the American soldier after more training and experience will prove himself a worthy opponent.

These calculations were substantially accurate. The total number of Americans in France at the end of March was approximately 370,000, with a combatant strength of about 150,000 organised in five divisions. The first American divisions took over an active section of the front on April 25 and at Cantigny on May 28 made the first American attack. Ludendorff decided that, in order to anticipate America, the first attack must be made before the middle of April and selected the St. Quentin front. The strategical purpose behind this enterprise was the separation of the British and French Armies. The main axis of the attack was to be directed at first just north of the Somme where it bends westwards to the sea near Péronne. The Somme reached, that river was to be used to hold off the French reinforcements coming up from the south; and the general direction of the attack was to be changed northwestwards so as to round up the British Army against the coast.

The objection to the St. Quentin front was that an attack there led across the devastated area of the Somme battlefields, but Ludendorff held that this disadvantage was more than counterbalanced by the strategic results which the plan offered and by the importance of beginning early. As he had told the Kaiser, this attack was to be but the first of a series, and instructions were issued to army commanders to prepare for such a series along a great part of the front. These attacks were given code names, that on the St. Quentin front being called the "Michael" attack. The date selected for it was about March 20. It was to be followed by a subsidiary attack south of the Oise called "Archangel." Prince Rupprecht was to prepare for the offensive which he had advocated on the Armentières-La Bassée front, to which the name "St. George I." was given and for a second on the Ypres front called "St. George II." The Crown Prince was to prepare an attack in Champagne to which the name "Blücher" was subsequently given.

*Preparations for the Offensive.*—In order to preserve secrecy, each army was given the impression that its attack would be the first and the most important and therefore the preparations for all the attacks were seriously made. The reserves for the Michael attack were so placed that they could be brought up rapidly by night marches to the St. Quentin front, but could be moved almost as readily for the St. George I. and Blücher attacks. It is interesting to observe the effects of these preparations on the minds on the other side of the line. Sir Douglas Haig in France and Sir W. Robertson in London both deduced from the German dispositions that the first attack would be made on the St. Quentin front and might be expected at any time after March 1. But there could be no certainty that this would be the main German effort and Haig was aware of the preparations for the St. George attacks. In view of the sensitiveness

of his left to any threat of a German advance against the Channel ports, and to the fact that a comparatively short advance would enable the Germans to shell Calais and Boulogne with long range guns, he decided to keep the bulk of his reserves north of the Somme and for the same reason to refuse the demand of the military executive committee for divisions for the general reserve.

Pétain, while agreeing that the indications showed that the first attack would be made on the British, was by no means sure that the enemy's main attack would not be delivered on the Champagne front; and his eyes were constantly upon the preparations in that area. Right up to the Doullens conference on March 26, he was chary of sending reinforcements to help the British until he was more certain that a great attack, which might open the road to Paris, would not be made against his own front. The military representatives at Versailles were of opinion that the difficulties of the shell-torn and devastated area of the Somme would prevent an attack on the St. Quentin front, and they expected an attack on the La Bassée-Arras front to take place probably in May. Therefore although Ludendorff was unable to conceal the preparations on the St. Quentin front and Haig's intelligence staff accurately predicted the place and date of the German attack, yet he had made his dispositions with such skill as to keep his enemies in doubt of his intentions even after the Michael attack had begun.

*German Offensive of March-April 1918.*—Strategically it may be said that the issue of that battle was decided on March 28, when Byng's III. Army defeated the attacks of the right of the German XVII. Army south of Arras. The effect of this combined with the unexpectedly easy success of the attack of the German XVIII. Army against the British right was to cause Ludendorff to make a fundamental change in his plan. Instead of directing his main attack north of the Somme, with the object of using that river as a barrier against the French and of making an eventual turn northwest against the British right flank, he directed his main effort south of the Somme, generally southwestwards. Thus it was committed to an area which could be most readily and speedily reinforced by the French; and when Foch was appointed at Doullens "to co-ordinate the operations of the Allied armies on the Western Front," and had decided to direct all his energies to maintaining the junction between the French and British Armies, the Michael attack was brought to a standstill.

That attack was followed on April 6 by the Archangel attack just south of the Oise. Originally designed as a subsidiary effort to help the Michael attack forward, it was now used to improve the somewhat awkward situation of the XVIII. Army, which had been stopped in a pronounced salient with its head towards Amiens. Having secured some ground up to and slightly beyond the Ailette, the Archangel attack was stopped on April 8. The next day Prince Rupprecht began an attack in Flanders against the front held by the Portuguese in the neighbourhood of Neuve-Chapelle.

Towards the end of March Ludendorff had reduced the plans for the St. George I. and II. attacks to the limits of a secondary enterprise, and the battle in Flanders was begun with no ambitious aims. It at once achieved such success that Prince Rupprecht was authorised to return to his original programme and the Germans had hopes of securing the whole of the Flanders ridges. The St. George I. attack was directed on the important railway junction of Hazebrouck and was stopped at no great distance from that town, but the St. George II. attack delivered against the Ypres salient by the German IV. Army was to a great extent evaded by the timely evacuation of the salient by the British II. Army; and thanks to the arrival of French reinforcements that attack only resulted in the capture by the Germans of the important Hill of Kemmel, the main ridges remaining in the hands of the Allies.

Ludendorff has often been criticised for allowing himself to be diverted by the first success of the battle in Flanders from his original objective, the separation of the British and French Armies, and it has been maintained that had he limited Prince

Rupprecht's efforts, as he had intended to do, and renewed the attacks south of the Somme, he would have captured Amiens and thereby made traffic between the French and British Armies difficult if not impossible. Certainly during April the Allied position in front of Amiens was highly critical, but all the experience of the War had shown that once a great attack had been brought to a standstill the difficulties of restarting it were almost insuperable; and in this case the area behind the front of the German XVIII. Army had been devastated in repeated battles and the communications behind that army were exceptionally difficult, while seeing that French reinforcements arrived from the south to stop the St. George attacks it is reasonably certain that they would have stopped a renewal of the Michael attack upon Amiens, had that been attempted.

*Results of First German Attacks.*—Though Ludendorff had failed in his main purpose he had gained a greater measure of success than had been won on the Western Front since the beginning of trench warfare, and had for the time exhausted the offensive power of the British Army. Its battle casualties amounted to 14,053 officers and 286,517 other ranks. The Germans captured 65,000 prisoners and 769 guns, many more guns were damaged and a vast quantity of war material fell into the enemy's hands. The losses in material, thanks to the activities of the Ministry of Munitions, were quickly replaced; but the replacement of the casualties, swollen by an inevitable increase in the number of sick, was a more serious matter.

The British age of military service was raised, and 140,000 drafts were sent out, but further help could only come from the secondary theatres of war. Therefore two divisions were brought to France from Italy, the proposed offensive in Palestine was abandoned and two divisions were transferred from Allenby's command, while a number of British battalions were released from Palestine, their places being taken by battalions of the Indian Army. Some more battalions were transferred from Salonika. By these means the ten divisions, mainly from his V. Army, which Haig had been compelled to break up, were gradually reconstituted, and the strength of his command was restored.

But during this period of reconstruction the initiative necessarily remained with the Germans; and Ludendorff, having envisaged a long series of battles, was not disposed to give up the attempt to win victory because his first efforts had not given him all that he had hoped. By the end of May the number of German divisions in the West had reached 207, the greatest number attained, and with 81 divisions in reserve Ludendorff proposed that the Blücher attack should be his next great effort and should be begun on the Chemin-des-Dames front which he knew to be weakly held. The Blücher attack, begun on May 27, swept over the Chemin-des-Dames, across the Aisne and was only stopped on the Marne near Château-Thierry by the timely arrival of American divisions. (See GERMAN OFFENSIVE.)

*Combined German Attacks.*—The result of this battle, which brought the Germans to within 40 m. of Paris, was to leave them in a very narrow salient, with its head on the Marne and, as after the Michael attack, so now, Ludendorff attempted to improve this position, first by an attack intended to reach Compiègne, delivered to the west of the salient by the German XVIII. Army on June 9, and secondly by another attack on the following day on the western face of the salient near Villers-Cotteret. Foch had divined Ludendorff's intention and both these attacks were checked and yielded little result.

Thereafter there followed a pause which proved fatal to the Germans and exposed the underlying fallacy in Ludendorff's plans. He had from the first seen that time was a vital factor, that he must defeat the French and British before the Americans could intervene, and under that impression he had attempted too much at first. If his first attacks had taken the form of a series of limited blows designed to exhaust the enemies' reserves and to culminate in a great final effort when those reserves had been exhausted it is just possible that his application of this policy might have been as successful as Foch's

proved to be later. But he had in fact in the Michael, St. George and Blücher attacks attempted to break through, and had been induced by preliminary success to carry on each of these battles into the stage where they yielded little but loss. Consequently his efforts instead of being continuous and progressive were broken by the necessity for rest and preparation. An undue effort left him momentarily weakened.

For some time past Rupprecht had been instructed to prepare for a renewal of the battle in Flanders, which it was hoped would hem the British Army against the coast, but this attack was to be preceded by a great attack on either side of Reims designed to widen the Marne salient and drive in towards Paris. Rupprecht's preparations, which had begun in May, were known both to Haig and to the British Govt. and when the Blücher attack developed at the end of May, and Foch called upon Haig to send eight divisions to help the French, the British Govt. sent Gen. Smuts (then a member of the War Cabinet) to Haig, to inquire whether this would not endanger the British Army. To this Haig replied that Foch, having been appointed generalissimo (he had been given that title at an Allied Conference at Amiens on April 14), must be supported, and that he would take the entire responsibility of sending off the divisions, which went accordingly. It may be mentioned that, as the result of Foch's appointment the Versailles Military Executive Council had disappeared and Sir Henry Rawlinson had resumed command of the British IV. Army.

*Allied Position Improves.*—The accumulation of Allied reserves between Amiens and the Marne had decided Ludendorff to attempt the attack east of Reims, where he believed the line to be held weakly. But his attacks could not be ready until July 15 and the five weeks' delay since the end of the Blücher attacks had brought a great improvement in the Allied situation. All the British divisions which had been broken up as the result of the Michael and St. George attacks had by then been reconstituted and, as the consequence of a special appeal to the President of the United States made in the crisis of March, and the provision of extra shipping, American troops had been arriving since the end of April at the rate of 300,000 a month.

Thus the number of American divisions ready to take part in battle was steadily increasing. Further Ludendorff's plans became known to Foch and when the German attack was made it was defeated (see GERMAN OFFENSIVE). That defeat was promptly followed by a counter-attack in the Marne salient which Foch had prepared for some time (see MARNE, SECOND BATTLE OF THE). The success of that counter-attack was so complete as to compel Ludendorff to draw upon his reserves elsewhere and to postpone Rupprecht's projected offensive. Therewith the initiative passed finally from Ludendorff to Foch.

#### THE ALLIED OFFENSIVE, 1918

Towards the end of July Foch had agreed with the Allied Commanders-in-Chief that in order to keep the initiative and to free lateral communications a series of local offensives should be undertaken, the first by the British on the Amiens front to free the Paris-Amiens railway; the second by the French on either side of Compiègne to free the Paris-Avicourt railway in its northern section; the third by the Americans to free the Paris-Avicourt railway in its eastern section.

*Battle of Amiens.*—For the first Haig had some time previously instructed Rawlinson to prepare, and now, to extend the scope of the proposed battle, Foch placed Gen. Debeney's I. Army on Rawlinson's right, at Haig's disposal. The battle began on Aug. 8 (see VICTORY, ADVANCE TO), and resulted in a triumph for the new type of British tank. Foch, delighted with the British success, urged Haig forward across the Somme to the capture of Péronne, but the British commander-in-chief had no desire to repeat Ludendorff's mistake and allow the unexpected success of a preliminary attack to tempt him into continuing a battle into the stage when the first drive had lost its momentum and further fighting would cause heavy losses in return for small gains.

The battle had achieved its original purpose, the freeing of the Paris-Amiens railway, and Haig insisted that instead of knocking his head against the stiffening resistance of the Germans his attack should be transferred further to the north. So on Aug. 21 Byng with the British III. Army began the battle of Bapaume, the town being captured on Aug. 29. The success of Byng's operations induced Haig to extend his front of attack still further to the north and on Aug. 26 Horne's I. Army, co-operating with the left of Byng's III. Army, began the battle of the Scarpe, which drove the Germans back from in front of Arras into the main defences of the Hindenburg system.

*Further Allied Successes.*—Meanwhile the second of the limited offensives had begun and on Aug. 10 Humbert with the French III. Army attacked and secured the German positions on the *massif* of Lassigny, while a few days later Mangin on Aug. 17 advanced with the French X. Army northeast of Compiègne and in a series of attacks penetrated to the valley of the Ailette and secured the heights north of Soissons. Thus, as the result of Haig's intervention, the scope of the first two operations had been greatly extended, the German lines had given way on a front of 70 m. and the Allies by Sept. 2 held the chord of the great salient which had run from near Arras, by Albert, just southeast of Amiens to Soissons. That chord now ran in a general north and south line from the Scarpe 10 m. east of Arras, by Péronne and Noyon to Soissons.

*German Retreat Commences.*—Ludendorff had not at first been much perturbed by the initial success of Foch's counter-attack of July 18 and he had gone to Flanders to hasten the preparations for Rupprecht's offensive. When there he learned the full extent of the disaster which had befallen German armies and cancelling that offensive he began to withdraw troops from Flanders to ease the situation on the Marne front. While he was so engaged the battle of Amiens came like a thunderbolt from a clear sky and the resulting situation was felt to be so grave that a crown council was held at Spa on Aug. 13-14, at which Ludendorff declared that it was no longer possible for Germany to gain her war aims and a peace by arrangement should be sought at the first favourable opportunity, while Germany still held large stretches of Allied territory.

This complete change of front produced a political crisis and resulted in the negotiations which made Prince Max of Baden German Chancellor. The evacuation of the great Lys salient created by Rupprecht in April was decided on and this evacuation was now hastened by a number of local attacks by the British. On Aug. 30 they re-occupied Bailleul and by the end of the first week of Sept. the Germans had recrossed the Lys and were back in the lines from which they had started in the spring. On Sept. 12 Gen. Pershing completed the series of preliminary operations by attacking the St. Mihiel salient with nine American divisions.

With the elimination of that salient the introductory phase in the advance to victory came to a close. Within eight weeks a complete change had taken place in the military situation. No longer were the Allies anxiously anticipating German attacks from positions menacing Paris and the Channel ports; the Germans, who had lost all their territorial gains of the spring, were now anxiously anticipating the next Allied blow and had abandoned all hope of winning the War. Their reserves were depleted, while those of the Allies were steadily increasing. Ludendorff had been compelled to break up 16 of his divisions to provide drafts for the remainder. In May the Americans had three divisions fit for battle, now Pershing could place at Foch's disposal 25 divisions, each double the strength of a German division. At the end of April Haig's strength had fallen to 48 divisions fit for battle, by mid Sept. this number had grown to 61. Thus while in May the Germans had 207 divisions opposed to 153 Allied divisions, after the battle of St. Mihiel they had 191 divisions opposed to 210 Allied divisions, counting one American as the equivalent of two German divisions.

*Allied Offensive Plan Outlined.*—Success had fired the Allied troops with enthusiasm, while the Americans were fresh and

inspired with the zeal of crusaders. Defeat had on the other hand greatly depressed the German ranks and the tanks which the Germans had neglected had become a weapon of terror. In these circumstances Foch and the Allied commanders-in-chief agreed that the time had come to seek victory in 1918 by means of a series of combined attacks to be delivered as soon as possible after the American operations at St. Mihiel were concluded. These were to be made

1. By the Americans west of the Meuse in the direction of Sedan.
2. By the French west of the Argonne in the direction of Mézières.
3. By the British on St. Quentin-Cambrai front in the direction of Maubeuge.
4. By Belgians, British and French in Flanders in the direction of Ghent.

(See VICTORY, ADVANCE TO.)

*First Overtures for Peace.*—On Sept. 28 the Hindenburg system was cracking under Haig's blows and on that day Hindenburg and Ludendorff agreed that the situation of their armies was desperate. The next morning they informed the German Foreign Minister than an immediate request for an armistice was essential and on Oct. 4 the first peace offer was sent to President Wilson. Thus it was the battle of Amiens which decided Ludendorff to tell the Kaiser on Aug. 15 that a German victory was impossible and the battles of the end of Sept. together with the news of the collapse of Bulgaria before Gen. Guillaumat's attacks and of the Turks in front of Allenby, which caused him to appeal for terms. The suggestion, therefore, that the collapse of Germany was due to what is generally known in that country as the "stab in the back," that is to say, internal revolution and not to military defeat, cannot be substantiated, though it is true that the despatch of plenipotentiaries, who crossed the Allied lines on Nov. 8, was hastened by the revolution, as was their readiness to accept on Nov. 11 the terms imposed.

*Position on Nov. 11.*—The general situation on Nov. 11 was that the Allied front ran northwest from Pont-à-Mousson on the Moselle through Stenay-Sedan-Mézières-Chimay Mons-Ath and Ghent to the Dutch frontier. Thus the Allied right was considerably nearer to the German lines of retreat over the Rhine than were the German forces in Belgium. It has often been held that the Allies should, therefore, instead of imposing terms on Nov. 11, have continued the struggle and ended the War dramatically by compelling a large mass of German troops to surrender.

The decision to impose terms was made by Foch in consultation with the Allied commanders-in-chief because on Nov. 11 the Allied advance to the Meuse had come temporarily to a standstill. The Germans had in their retreat destroyed very completely both roads and railways and until these could be repaired supplies could not be brought up to the front beyond the line reached on Nov. 11. Therefore on the Meuse front a short halt was necessary and this would have given the Germans time to rally behind the Meuse and have entailed further battles. Foch had provided for this contingency and had actually begun to set in motion a new Allied offensive by French and American troops directed into Lorraine on either side of Metz, in order to turn the line of the Meuse. This portion of the front was weakly held by the Germans and against it the Allies could have brought their freshest troops and their largest reserves, for it was in this quarter that the bulk of the American Army was employed.

At the time of the Armistice the number of American divisions in France had increased to 42 and of these 32 were ready for battle. There is therefore no doubt but that an immediate advance into Lorraine would have been successful and have placed the German armies on the Meuse in a position of great embarrassment by the time that the Allied advance against the Meuse could have been resumed. Foch and the Allied Commanders, however, felt that if they could force Germany to accept such terms as would leave her militarily helpless they had no right to call for a further sacrifice of life or to expose the territories of France and Belgium to further devastation. It was in this spirit that the Armistice was signed in Foch's railway carriage in the forest of Compiègne on Nov. 11.

**WESTER WEMYSS, ROSSLYN ERSKINE WEMYSS, 1ST BARON** (1864– ), British sailor, was born in London April 12 1864, a posthumous son of James Hay Erskine Wemyss of Wemyss Castle, Fife. He entered the navy in 1877, was promoted lieutenant 1887, commander 1898 and captain 1901. Rear-admiral of 2nd Battle Squadron 1912–3 and of the 12th Cruiser Squadron 1914, he was made vice-admiral 1916 and admiral of the fleet 1919. He commanded a squadron during the landing of the British troops in Gallipoli (1915), was commander-in-chief in the East Indies and Egypt (1916–7), deputy first sea lord, and afterwards first sea lord of the Admiralty (1917–9) and a member of the War Cabinet (1918). He was created K.C.B. (1916), G.C.B. (1918) and raised to the peerage in 1919. In 1924 he published *The Navy in the Dardanelles Campaign*.

**WEST INDIES, BRITISH** (see 28,544).—In 1925 the estimated total population of this group was 1,805,436 (Bahamas 55,423; Barbados 159,499; Jamaica 904,405; Turks and Caicos Islands 5,400; Cayman Islands 5,465; Trinidad and Tobago 381,753; Grenada 68,957; St. Lucia 54,304; St. Vincent 47,591; Antigua 29,420; Dominica 38,632; Montserrat 11,890; St. Kitts-Nevis 37,140; and the Virgin Islands 5,557). Emigration from the islands to Cuba and Santo Domingo remained considerable, but the adoption of the quota system in the United States in 1924 almost stopped the exodus to that country.

### I. POLITICAL HISTORY

On the outbreak of the World War in August 1914 many West Indians came over to enlist, and a contingent comprising 15,601 officers, non-commissioned officers and men was recruited voluntarily for active service and embodied as the British West Indies Regiment, which served with distinction in France, Flanders, Egypt, Palestine and elsewhere. Private contingents also went over for enlistment in the United Kingdom. The total contributions made by the British West Indies towards the cost of the War, relief funds, etc., amounted to over £3,250,000, the most notable gift being a contribution of £60,000 annually for 40 years voted by the Jamaica Legislature.

While the idea of political federation of the West Indies awoke little enthusiasm the scattered colonies tended increasingly to co-operate in matters of common interest. This is largely attributable to the intercolonial conferences which were held from 1899 onwards to consider such matters as agriculture, legal affairs, quarantine, customs tariffs, etc. All proved eminently successful, the customs conference (1919), for example, having resulted in the adoption of uniformity of definition and arrangement of the West Indian tariffs, whilst the conference on legal affairs (1916) led to the establishment of a West Indian court of appeal. A further step in the direction of closer union was the foundation in 1917 of the West Indian Associated Chambers of Commerce, which holds triennial conferences that serve to focus opinion on commercial matters affecting the group. In 1926 a conference, at which all the West Indian colonies as well as British Guiana and British Honduras were represented by official and unofficial delegates, was held in London to discuss the desirability of setting up a permanent conference or council to discuss periodically West Indian affairs. In 1920–21 Grenada, St. Lucia and St. Vincent petitioned the King for the substitution of representative government for the Crown Colony system. While the request of Grenada was granted, those of St. Lucia and St. Vincent were rejected on the grounds that the signatories were not sufficiently representative.

In 1921–2 a Colonial Office mission, comprising the Hon. Edward Wood, M.P., Under-Secretary for the Colonies, the Hon. W. Ormsby-Gore, M.P. and Mr. R. A. Wiseman visited the West Indies and British Guiana with the object of promoting

closer touch between the Colonial office and those colonies and of studying the constitutional question. They visited in succession all the islands and British Guiana. In his report (Cmd. 1,679) Mr. Wood advocated the reintroduction of the elective system into the constitutions of Grenada, St. Lucia and St. Vincent and its adoption in Trinidad and Tobago. He recommended an increase in the tariff preference granted by Great Britain on Empire sugar from one-sixth to one-third, and in the event of the duties being reduced its stabilisation on the basis of not less than £3 15s. od. per ton on 96° sugar, and the adoption of the proposals for establishing an "all red" telegraphic system in the British West Indies. Most of his recommendations were adopted. Trinidad, which had been since its cession in 1797 a Crown Colony, with its ward Tobago, was granted a measure of representative government, and the elective element was reintroduced into the constitutions of Grenada, St. Lucia, St. Vincent and Dominica. The result of the British Empire Exhibitions of 1924 and 1925 was to attract much tourist traffic to these colonies, and to increase the interest taken in their affairs in Great Britain. Delegations of Members of Parliament visited parts of this area in 1924 and 1925; the Prince of Wales had already toured them in 1920.

### II. ECONOMIC HISTORY

*Trade.*—The World War and the boom which followed brought about a remarkable revival of prosperity to the British West Indies, their total trade rising from £20,993,559 in 1913 to £54,691,648 in 1920. In 1923 the total was £30,674,367. The chief staples, sugar, rum, molasses, cacao, cotton and arrowroot, all commanded greatly enhanced prices, the only industry, indeed, that reaped no benefit being that of the production of lime and lime products in Dominica, which was adversely affected by the lack of shipping facilities and by import restrictions in the United States. More recently it suffered from the outbreak of witherip disease, which necessitated Imperial assistance of £22,000 (loan £13,400; grant £8,600).

Some anxiety was caused in 1912 by the decision of the Imperial Government to withdraw from the international convention for the suppression of sugar bounties and cartels, but the remaining high contracting Powers having decided to adhere to that agreement no ill effects resulted. Though Great Britain withdrew from the convention, she decided to adhere to its principles and not to give a preference to sugar produced within the Empire or to cane over beet. In Aug. 1918 she gave to the signatories of the convention six months' notice of her intention to resume complete liberty of action in respect of her policy with regard to sugar, and the Finance Act of 1918 provided for the granting of a preference of one-sixth off the duties on sugar, molasses, tobacco, coffee, cacao and other products imported from within the Empire into the United Kingdom, and a preference of 2s. 6d. per gallon on rum. The preference on sugar was increased in 1925 from 1s. 8-3d. per cwt. on sugar polarising 96° (to which it had fallen consequent upon a reduction in the sugar duty in the preceding year) to 3s. 8-75d., and stabilised for 10 years at that figure by clause 7 of the Finance Act of 1925.

Following an inquiry in 1909 by a Royal Commission, a conference was held at Ottawa in 1912 between representatives of the Dominion and the British West Indian colonies, the Bahamas, British Honduras and Jamaica excepted, to consider the question of closer trade. On April 9 1912 a reciprocal trade agreement was signed, the basis of which was a mutual preference of 20% on the chief products of the countries concerned, with a minimum preference on flour in favour of Canada of 12 cents per 100 lb. and 15 cents on 96° test sugar not over No. 16 Dutch standard in colour in favour of the British West Indies. Certain concessions which the Canadian refiners had enjoyed of importing foreign sugar at the British preferential rates were withdrawn. The agreement came into force on June 2 1913. Grenada gave her adhesion in the same year.

In 1920 a second conference was held at Ottawa at which all the West Indian colonies, and also the Imperial Government, were represented. A new agreement was signed on June 18 1920, and brought into force in May 1921, under which Canada agreed to give to British West Indian products a tariff preference of 50%, whilst the British West Indies similarly agreed to extend to Canadian products tariff preference of 50% in the case of Barbados, British Guiana and Trinidad, 33½% in that of British Honduras, the Leeward Islands and the Windward Islands, 25% in Jamaica and 10% in Bahamas, the legislature of which colony afterwards voluntarily increased the preference to one of 25%. Certain products were again specifically dealt with, the preference on Canadian flour entering the West Indies being not less than 1s. per 196 lb., and that on West Indian sugar being not less than 83-712 cents per 100 lb. on 96° test.

The Government of Canada further agreed to endeavour to arrange for a weekly freight, mail and passenger service, with steamers of 5,000 to 6,000 tons burden, capable of steaming 12

knots, between St. John (New Brunswick) or Halifax (Nova Scotia) down the islands lying to windward, British Guiana and back, the colonies contributing £27,000 per annum; also a service of freight, mail and passenger steamers of 3,500 tons burden, capable of steaming 10 knots, from Canada to Nassau (Bahamas), Jamaica, Belize (British Honduras) and back, fortnightly, the colonies concerned contributing at the rate of £13,000 per annum toward any loss involved should the service prove unremunerative. The Canada-British Honduras service was inaugurated in Jan. 1921, but the western service was withheld. A declaration appended to the agreement favoured the laying of British-owned and British-controlled cables as soon as possible, to connect Bermuda with Barbados, Trinidad, British Guiana, the Windward Islands, the Leeward Islands and Turk's Islands or Jamaica.

In 1925 a new and more comprehensive agreement was signed under which West Indian produce (other than tobacco, cigars and alcohol) was to enjoy a preference of 50% off the full duty on entering the Dominion. Canada was to withdraw the benefit of the British preferential tariff from any British colony producing cacao beans which did not extend to her a satisfactory reciprocal preference. She was to admit, free of duty, bananas produced in British colonies and impose a duty of 50 cents per bunch on foreign bananas.

Canada also undertook to provide for the western group a fortnightly freight passenger and mail service from Canadian ocean ports calling at all the islands both ways and at British Guiana, and alternating with a fortnightly freight service from five ports in summer and ocean ports in winter calling at St. Kitts, Antigua, Barbados, Trinidad and British Guiana. Towards the cost the colonies visited were to contribute £29,000 annually. For the western group Canada was to provide a fortnightly passenger freight and mail service with refrigeration for 70,000 bunches of bananas alternating with a fortnightly freight service to carry 50,000 bunches of bananas. The West Indies on their part were to give increased tariff preferences, namely 2s. per barrel or bag of 196 lb. of Canadian flour, and in the case of Jamaica, the Bahamas and British Honduras a preference not less than 30% on dairy products, meat and apples, and in the other colonies a preferential duty of not less than one-third of the general rate.

**Industries.**—Sugar remains the principal staple. Under the central factory system canes from the surrounding estates or farms are dealt with at a central base, at which the most efficient extracting machinery can be installed. The cocoa industry suffers from competition with the rapidly increasing production of cacao in West Africa. The banana industry is making headway in Jamaica after a setback due to a succession of hurricanes in 1915, 1916 and 1917. A considerable acreage has been planted under bananas in St. Lucia, and much interest in this crop is being shown also in Grenada and Trinidad, it being believed that arrangements will shortly be made for the provision of a fruit steamer service.

The Sea Island cotton industry, which owed its development in the West Indies to the ravages of the boll-weevil in the United States, received a check in 1920, through the appearance of the still more dreaded boll-worm in St. Kitts and Montserrat, to which it was brought by a Brazilian vessel. A comparatively new industry, which made rapid progress, was that of rice. At one time British Guiana had imported large quantities of rice for the Eastern immigrants, but in 1905 this colony was already able to cover her requirements and export 45,223 lb. and in 1925 15,495,727 pounds.

Almost as rapid has been the development of the petroleum industry in Trinidad. The existence of petroleum deposits in Trinidad has long been recognised. As far back as 1864 oil was struck, but it proved impossible to make a financial success of the enterprises concerned. About 1900 Mr. Randolph Rust, a local resident (mayor of Port of Spain in 1921), imported modern oil-boring machinery and successfully struck oil at Aripiero in 1901. Other prospectors came on the scene, and in 1910 followed the successful flotation of the Trinidad oilfields, and Trinidad enjoyed an extraordinary boom. The new industry, which was officially inaugurated in 1911, developed rapidly. With many new wells being drilled it was certain that the production of oil, which in 1925 amounted to 126,233,293 gal., would undergo material expansion.

**College of Tropical Agriculture.**—As the outcome of the report of a committee appointed by Lord Milner in 1919, the Imperial College of Tropical Agriculture was founded in 1921, with headquarters at St. Augustine, about seven m. east of Port of Spain, Trinidad. Its objects are to provide training in the science and practice of tropical agriculture to students intending to become tropical planters, agricultural administrators or officers or specialists in different branches of agricultural science and technology, and to offer facilities for the study of tropical agriculture to graduates of other colleges and universities. An important feature of the college is the provision for research and investigation work which its laboratories and fields afford. The site was given by the Govt. of Trinidad and Tobago, whose planters furnished £50,000 towards the erection of the college building, the first wing of which was opened by the governor, Sir Horace Byatt, in the presence of Lord Peel and the other members of a parliamentary delegation which was visiting the island. Maintenance is provided for by Imperial grants and contributions from the Govts. of certain of the West Indian and West African colonies. Attached to the college is an instructional

sugar factory, towards which the British sugar machinery firms contributed plant to the value of £20,000.

**Communications.**—In 1915 the Royal Mail Steam Packet Co. terminated the transatlantic contract steamer service on the ground that they had been precluded from using their terminal port at Southampton. In the same year the fortnightly intercolonial contract service was also terminated by mutual agreement between the company and the colonies concerned. For some time thereafter the company continued to berth small passenger steamers for the West Indies at irregular intervals; but this service was also brought to an end in 1920, and passengers between the West Indies and Great Britain were compelled to travel by foreign steamers, cargo boats or via Canada or the United States. In 1920 T. & J. Harrison, who had acquired Scrutton Sons & Co.'s cargo service, entered the transatlantic passenger business. They now send passenger steamers every few weeks to Barbados, Trinidad and British Guiana. Later, Elders and Fyffes Ltd. included Barbados and Trinidad in the itinerary of certain of their steamers. It is consequently only in and in connection with the smaller islands that the need for better steamship communication is seriously felt, though throughout the colonies there is a demand for a regular line of steamers to carry fruit to Great Britain.

New cables were laid in 1924 from Grand Turk to Barbados, with spurs from Barbados to British Guiana and Trinidad, and wireless stations established at Barbados, Grenada, St. Lucia, St. Vincent, St. Kitts, Antigua and Dominica. The new system is conducted by the Pacific Cable Board on behalf of the Govts. of Great Britain, Canada, British Guiana and the West Indian colonies concerned.

Aspinall, *Colonial Reports* (Annual). *The Pocket Guide to the West Indies*.

**WESTINGHOUSE, GEORGE** (1846–1914), American inventor and manufacturer, was born at Central Bridge, N.Y., Oct. 6 1846. He entered the Union Army in the Civil War in 1863, but in 1864 was appointed third assistant engineer in the navy. At the close of the Civil War he resigned and entered Union College, but on the advice of the president, withdrew to devote his time to mechanical invention. In 1865 he invented a device for replacing derailed cars and also a reversible steel railway frog. In 1869 he patented his air-brake and organised the Westinghouse Air Brake Company. In 1872 he invented the automatic air-brake (see 4.414). This brake was quickly adopted by railways in America and gradually in Europe. He also developed a system of railway signals, operated by compressed air with the assistance of electrical contrivances. In June 1912, he received the Edison Gold Medal for "meritorious achievement in connection with the development of the alternating current system for light and power." In 1893 this system was installed at the Chicago Exposition. Later his Pittsburgh establishment built dynamos for the power plants at Niagara Falls, for the rapid transit systems of New York City, and for the London Metropolitan Railway. Westinghouse also devised a method for conveying gas through long-distance pipes, thus making it a practicable fuel. He died in New York March 12 1914.

**WEST POINT** (see 28.558).—The administration building, east academic building, riding hall, two new cadet barracks, cadet chapel and chaplain's quarters, artillery barracks and stable, cavalry barracks and stable, eight sets of officers' quarters, two apartment buildings each containing eight sets of officers' quarters, a cadet laundry and a concrete athletic stadium with a capacity of 20,000 were completed after 1910. By Act of May 4 1916, the number of cadetships authorised at the academy was increased to 1,332. By authority of the War Department, April 1915, candidates were permitted, in lieu of passing the regular entrance examination, to qualify for admission upon the presentation of satisfactory certificate of previous academic work in accredited institutions. By Acts of 1919 and 1920, the pay of cadets was fixed at \$780 per annum and one ration per day or commutation thereof at the rate of \$1.08 per day.

The War and the demand for officers led the War Department to direct the graduation of the First or Upper Class April 20 1917, and of the Second Class Aug. 30 1917. The next year the need for officers resulted in the graduation of three classes, the first, June 12 1918, and the second and third together, Nov. 1 1918. A class of new cadets was admitted at an irregular time, Nov. 2

1918, and provision was made for a temporary one-year course. After the Armistice the War Department directed, May 12 1919, that the course of instruction be fixed for three years, but the following year Congress specified that the course should be four years. The academic authorities thereupon reorganised the curriculum in the light of the most recent military and educational experience.—

The schedule contains the following features:—

(1) The upper classes on duty undergo military training June 15 to Aug. 30, at West Point; (2) the new Fourth Class enter the academy July 1 and receive at West Point preliminary military training until Aug. 30; (3) during the academic year, extending from Sept. 1 to June 4, tactical drills and supervised athletics alternate daily for all cadets; (4) academic instruction is given in the following subjects—*Fourth Class*, mathematics, English, French and surveying; *Third Class*, mathematics, English, French, political history, drawing and theoretical tactics; *Second Class*, natural and experimental philosophy, chemistry and electricity, Spanish and drawing; *First Class*, military engineering, law, military art and history, ordnance and gunnery, economics and government and military hygiene. Training in riding and equitation is given to the upper three classes.

The number of graduates of the academy 1910 to 1925 inclusive was 2,993. The superintendents since 1910 have been T. H. Barry, 1910-2; C. P. Townsley, 1912-5; John Biddle, 1916-7; S. E. Tillman, 1917-9; Douglas McArthur, 1919-22; Fred W. Sladen, 1922-6; Merch B. Stewart, 1926— (F. W. S.)

**WEST VIRGINIA** (see 28.560), a State of the United States of America. In the decade before 1920 the population increased from 1,221,119 to 1,463,701 (19.9%), the urban population from 18.7% to 25.2%, and the density of population from 50.8 to 60.9 per square mile. The five largest cities in 1920 were Wheeling (56,208), Huntington (50,177), Charleston (39,608), Clarksburg (27,869) and Parkersburg (20,050).

**Agriculture.**—In 1920, 62.2% of the land area of West Virginia was in farms, and 57.7 was improved. The total number of farms was 87,289, and the total farm acreage was 9,569,720. In the preceding decade the total value of all farm property increased from \$314,738,540 to \$496,439,617 (57.7%), and the value of farm lands and buildings from \$264,390,954 to \$410,783,406, the value of implements and machinery from \$7,011,513 to \$18,395,058, and livestock from \$43,336,973 to \$67,261,153. The number of farms reported mortgaged grew from 9,525 in 1910 to 10,274 in 1920. The average debt per mortgaged farm was \$1,241 in 1920. Of the 87,289 farms in the State in 1920, 86,785 were operated by white farmers, of whom only 752 were foreign-born, and there were only 504 coloured farmers, compared with 708 in 1910. Of the native white farmers 71,181 were owners, 1,071 managers and 13,781 tenants.

**Domestic Animals.**—The following table shows the number of domestic animals in 1910, 1920 and 1925:—

|              | 1910    | 1920    | 1925    |
|--------------|---------|---------|---------|
| Horses       | 176,530 | 169,148 | 157,000 |
| Mules        | 11,577  | 14,981  | 15,000  |
| Milch cows   | 560,770 | 587,462 | 224,000 |
| Other cattle |         |         | 343,000 |
| Sheep        | 556,952 | 509,831 | 514,000 |
| Swine        |         |         | 261,000 |

The value of all crops for West Virginia in 1919 was \$96,537,459, compared with \$36,167,014 in 1909. The 1919 value of the corn crop was \$29,768,131; oats, \$3,054,668; wheat, \$8,395,997; hay and forage, \$23,746,574; potatoes, \$6,461,619; tobacco, \$2,731,338; apples, \$7,540,491; peaches, \$1,518,784. The variations in production of the chief crops in 1909, 1919, and 1923 is shown in the following table:—

|           | 1909       | 1919       | 1923       |
|-----------|------------|------------|------------|
|           | Bu.        | Bu.        | Bu.        |
| Corn      | 17,119,097 | 17,010,357 | 20,536,000 |
| Oats      | 1,728,806  | 3,054,668  | 4,600,000  |
| Wheat     | 2,575,996  | 3,747,812  | 2,760,000  |
| Buckwheat | 533,670    | 537,883    | 693,000    |
| Potatoes  | 4,077,066  | 2,809,398  | 4,851,000  |

In 1920 4,080,000 lb. of tobacco were produced. Fruit-raising has recently become more important, especially in the eastern

panhandle and South Branch. In 1922 the production of apples was 5,600,000 bu. and peaches 715,000 bushels. The extension of agricultural teaching, which was established at the West Virginia University in 1913, has been an important factor in the development of scientific agricultural methods.

**Mining.**—Next to agriculture, mining is the chief occupation. In mineral production West Virginia ranks second among the States of the Union. The total annual mineral output is valued at over \$300,000,000. Oil production in 1920 was 8,173,000 bbl., valued at about \$20,000,000. The yield in 1922 was 7,026,000 bbl. and in 1924 was 5,924,000. Gas production, which in 1919 was approximately 201,500,000 cu. ft. (valued at \$40,304,500), decreased to 192,660,989,000 cu. ft. in 1924. Coal production, which had reached 61,671,019 short (net) tons in 1910, continued to increase steadily, reaching in 1914 71,707,626 short tons, valued at \$71,391,408 and furnishing employment to 78,363 persons. The industry became especially active when the United States entered the World War. In 1916 the production increased to 86,460,127 short tons, valued at \$102,366,092. In 1919 it was 75,500,000 short tons, and, together with coke production of 1,454,000 short tons, gave employment to 91,566 persons. In 1920 it was 87,500,000 tons. The production of coke, which steadily increased until 1910, when it reached 14,217,380 short tons, valued at \$7,525,922, diminished in 1919 to 1,454,000 short tons. The total output of coal in 1922 was 81,000,000 tons, that of 1923 was 97,475,177 tons, valued at \$276,759,877, and that of 1924 was 103,325,060 tons, valued at \$206,651,920. The determination of the United Mine Workers in 1912 to unionise the mines of West Virginia led to a bitter and prolonged labour war.

**Manufactures.**—In 1914 West Virginia was the 28th State in importance of manufactures. The number of establishments was 2,749, with an invested capital of \$175,995,011 and a production valued at \$193,511,782. The number of persons employed was 79,353 (11% more than 1909), earning \$51,377,760. The leading industries were lumber and timber, steelworks, rolling-mills, tinplate and terneplate, glass, leather, railway cars and shop construction, flour-milling, and the manufacturing of clay products. The State ranked second in the production of glass, and also in the production of tinplate and terneplate, and eighth in the value of clay products. By 1923 the number of manufacturing establishments was approximately 3,000 with a total capital of \$225,000,000, employing 110,000 labourers and producing goods valued at over \$228,000,000.

**Water-power.**—One of the most prominent features is electrical production by water-power, which has largely transformed mine operation. Large projects have been planned on New Gaylor and Cheat rivers. The latest activity of this kind is on Cheat river at the Pennsylvania line, where a large dam was finally completed in 1926. A revision of the restrictions of the state Water-Power Act with a view to co-operation with the Federal Water-Power Act and to encourage water-power development was recommended by Gov. Cornwell in 1921. A Senate joint resolution, adopted April 29 1921, authorised the governor to appoint a commission to consider suitable water-power legislation suitable for development and proper control of natural water-power sites.

**Banks and Banking.**—Banking resources increased more than 100% in the years 1916-25. From 1920 to 1923 the total deposits in West Virginia state banks rose from \$154,440,268 to \$186,802,607 (which, however, decreased to \$183,922,397 in 1924) and in West Virginia National banks from \$136,717,000 to \$156,676,000. The condition of the banks in West Virginia in 1924 was as follows:—

|          | National Banks | State Banks  |
|----------|----------------|--------------|
| Number   | 125            | 225          |
| Capital  | \$13,126,000   | \$20,339,043 |
| Surplus  | 10,529,000     | 13,805,900   |
| Loans    | 131,320,000    | 71,729,992   |
| Deposits | 134,429,000    | 183,922,397  |

**Finance.**—The long impending dispute known as the Virginia debt question, which arose from the formation of West Virginia

as a separate State in 1863, was partly settled by a U.S. Supreme Court decision of 1911 and a later judgment of 1915 fixing the obligation of West Virginia at \$12,393,929.50 (including interest since 1861). It was finally settled in 1919 when the West Virginia Legislature, facing a threat of compulsion, arranged to pay \$1,062,287.16 in cash and the balance by an issue of "listable" 3½% bonds in favour of Virginia, payable in 1939 or earlier. The state fund revenue for the year ending June 30 1924 was \$10,416,699 and the disbursements were \$9,193,997. On June 30 1924 the total bonded indebtedness of the State was \$39,100,000, of which \$9,100,000 were Virginia debt bonds and \$30,000,000 were road bonds. Before 1914 West Virginia obtained its revenue for state purposes from a small direct levy on assessed valuations, a charter or licence tax on corporations, and from liquor or other licence. An Act of 1915 imposed a business tax which in 1921 produced \$1,400,000. The legislature in 1919 imposed a privilege tax on pipe-lines carrying oil and gas. This law, which was expected to yield about \$1,500,000, was declared unconstitutional by the U.S. Supreme Court in 1921. Anticipating the failure of the law the Legislature of 1921 passed an Act which repealed the laws of 1915 and 1919 and substituted therefor a gross sales tax designed to reach every person, firm, association or corporation, doing a business of \$10,000 or more in the State, and also declaring a tax on persons practising professions on the excess of their annual gross income above \$10,000. In 1925 the gross sales tax and the gasoline tax were increased. From 1918 to 1923 direct taxes increased \$24,694,311 (120%). In 1918 the aggregate assessed valuation of all property was \$1,449,451,754, in 1923 it was \$2,109,813,186 and in 1924 it was \$2,122,919,846 (real estate, \$1,236,516,283; personal, \$430,789,236, and public utility, \$455,514,327).

**Education.**—In 1924 the total school population was 479,766, the total school enrolment 401,344, the average daily attendance 316,510, the *per capita* cost of education \$37.33 based on enumeration and \$44.20 based on enrolment. The total number of teachers was 13,632. The total number of school houses was 7,196. The expenditure for all public schools (elementary and high) was \$21,446,542, and the total for higher state institutions was \$1,860,814. The value of public-school property was estimated at \$49,981,335. A compulsory school law of 1920 has steadily become more effective. The development of the high schools has been a prominent feature of recent educational growth. In 1924 the State had 218 classified high schools with 1,733 teachers and an enrolment of 32,075, with 5,317 graduates during the year. The high school property was valued at \$16,277,253. The total cost of maintenance in 1923-4 was \$3,402,730, or \$105.08 *per capita*. Under the Act of 1919 the control of all educational affairs of the State, from the lowest school to the university, was vested in a State Board of Education. The Board has an advisory council of three coloured citizens.

**Public Health.**—In 1914 a hygiene laboratory was established. In 1915 a State Department of Health was created; two new divisions, vital statistics and child welfare, were added by an Act of 1919. In 1925 general laws relating to health and medicine included provisions for examination and registration of midwives and nurses, for regulation of the practice of pharmacy and of chiropractic, for prevention of the sale of fraudulent diplomas by medical schools, for regulating the sale of caustic poisons and for legal action against places of prostitution.

**State Government.**—An amendment proposed in 1917 and ratified in Nov. 1918 provided that an itemised and classified budget should be prepared by the Board of Public Works and presented to the legislature for its guidance in determining appropriations. The governor urged the necessity of a modification which would place upon the executive the duty and the authority of preparing the budget, as the original draft of the amendment (before mutilation by the legislature) had provided, and in 1925 the legislature submitted a budget amendment placing large responsibility and power in the hands of the executive in the preparation of the budget. Another amendment ratified in Nov. 1920, provided for two periods of every regular session of the Legislature—one of 15 days in January, primarily for presentation of bills, and another

of 45 days in March–April, primarily for consideration and action on bills. An amendment in 1920 increased the salaries of members of the Legislature to \$500. By an Act of 1915 the membership of the House of Delegates (previously 86) was increased to 94. Following 1913 the salaries of elective state officers and supreme judges were increased. By an Act of 1919 the salary of the governor was increased to \$10,000, effective March 4 1921.

By an Act of 1919 a Dept. of Public Safety (state police) was established to relieve the military arm of the State and to aid in abolishing the system of private peace officers. Its need was demonstrated by a serious condition resulting from a strike of steel workers at Benwood and Weirton in the upper panhandle. Among the most important acts of the Legislature of 1923 were those providing for instruction in American history and civics in all public and private schools, for organisation of co-operative marketing associations to facilitate the sale of agricultural products, for increasing compensation paid to injured employees and for the appointment of factory inspectors. Among the most important general laws enacted in 1925 was one authorising a bond issue of an additional \$20,000,000 for further extension of state highways, one providing a better system of deposits of state funds, one creating a state forest and conservation commission, several relating to public health and medicine, and several relating to banking and taxation. The State continued Republican in politics, although party division resulted in the election of a Democrat, John J. Cornwell, to the governor's office in 1916 to succeed Gov. H. D. Hatfield. In the elections of 1920 and 1924, the Republicans elected the entire state ticket headed by Ephraim F. Morgan in 1920 and by Howard Gore in 1924.

**WEYGAND, MAX** (1867– ), French soldier, was born at Brussels Jan. 21 1867. Having entered the military college at St. Cyr in 1885, as a foreigner, he proceeded to the cavalry school at Saumur. He was appointed sub-lieutenant in 1888 and after successive promotions commanded the 5th Hussars in 1912. On Sept. 21 1914, as a temporary colonel, he was appointed chief of the general staff of an army, and in Aug. 1916 he was made a general of brigade. From the outset of the World War he was the immediate assistant of Marshal Foch, whom he succeeded as the French representative on the Inter-Allied General Staff in 1917. In April 1918 he resumed his work as Chief of the General Staff under Marshal Foch, which post he held during the remainder of the War; and in this capacity he was considered by many to be what Berthier was to Napoleon.

But, and here the balance was in his favour, he proved himself capable of personally directing operations on a very large scale in Poland. In Aug. 1920, when Warsaw was surrounded and threatened by a Soviet army, at a distance of only 20 km., Gen. Weygand arrived, and speedily reconstituting the disorganised Polish army, launched an offensive against the Bolsheviks' vulnerable points. In Dec. the enemy was in retreat. When the people of Warsaw acclaimed him, he said: "My rôle was merely to fill up the gaps; it was the heroic Polish nation itself which won the victory."

Weygand became a member of the *Conseil Supérieur de la Guerre*, and was made a grand officer of the Legion of Honour on Sept. 1 1920. In Nov. and Dec. 1922 he served as military expert on the French delegation to the Lausanne Conference, and in Jan. 1923, he was sent to the Rhine to inspect the Allied troops. The same year he succeeded Gen. Gouraud as high commissioner in Syria, where he proved himself to be a remarkable organiser. He was recalled to Paris on Nov. 29 1924, and placed in charge of the *Centre des Hautes Études Militaires*. (M. Gu.)

**WHALES AND WHALING** (28.570).—The last two decades of the 19th century which witnessed, at many European and American ports, the decay almost to extinction of whaling by the use of sailing ships and harpoons thrown from their boats, saw also the beginnings of the new whaling which was to replace

it. The Svend Foyn gun (see 28.571) was first employed for the capture of whales near the Norwegian coast; it was carried on small steamers and the whales being taken near shore were towed back to harbour for flensing and the extraction of oil. These three features—the use of the harpoon gun and harpoon with explosive head, of steamers capable of manoeuvring quickly and towing the whales, and of shore stations at which efficient plant could be installed for economic utilisation of the catch—are the essentials of modern whaling, an industry which has spread to practically every ocean coast of the world.

*Methods.*—No material change has been made in the harpoon, which has four 12-in. barbs which open out on entering the whale. Whale catchers and factories, however, have been developed greatly. A modern catcher is of 150 tons, with a crew of 11 men; she may reach 130 ft. in length, and can develop a speed of 12 to 15 knots. Similarly a shore station, with its accommodation, engine-houses, boilers and machines, is a small settlement and gives employment to about 150 men. Latterly, to enable whaling to be carried out in regions in which the maintenance of shore factories is difficult or impracticable, large ships equipped with boilers and other plant and capable of carrying 5,000 to 7,000 tons of whale oil are used. These floating factories do not operate in the open sea, but take up their position in such sheltered coves as they can find, where the attendant catchers (generally three in number) feed them with whales. The floating factory taken by Capt. Larsen to the Ross Sea was a 7,000-ton ship and was accompanied by five catchers. Although utilising a far greater proportion of the whale than was possible in the early days of whaling, floating factories are less efficient in economy than the shore stations.

*Factory Processes.*—On arrival at the factory, the whale is drawn up a sloping stage by means of a steam winch, power being used also in stripping the blubber, dividing blubber and carcass and transporting them to the boilers. The blubber is tried down in open boilers, the flesh and bones in pressure boilers, steam being the heating agent. The oil is graded into five qualities, of which grades 0 and 1 are obtained from blubber alone, 2 and 3 from carcass and bones and 4 from refuse. The finer qualities, after hydrogenation, are used in soap-making (see OILS, FATS AND SOAP). The oil was of great importance during the War as a source of glycerin; it is also used in the manufacture of margarine, and in dressing leather and fibre. The meat, especially that of certain species, is much used for food in Japan and has been used on the Pacific coast of the United States; for modern use, however, it must be eaten or tinned when very fresh. Whale meal and guano are made for cattle feeding and fertiliser respectively. Whalebone has much declined in importance in recent years. Ambergris is still employed in making perfumes. The value of the oil, however, enormously preponderates.

*Present Conditions.*—The new methods spread rapidly over the North Atlantic seaboard reaching Iceland and the Faeroes before 1900 and Great Britain shortly after, and after more than one exploratory voyage Antarctic whaling was resumed early in this century. The whaling in this region centres about the dependencies of the Falkland Is., whose waters are now by far the most productive whaling field. In 1906 Norwegian companies took 47,200 bbl. of oil from the Northern and 4,200 bbl. from the Southern Hemisphere; in 1911 they took 38,000 from the former and 306,000 from the latter. It may be added that the technical success of the Norwegians has led to whaling being very largely in their hands. According to expert evidence given before an Inter-departmental Committee on the Falkland Is. Dependencies, 72% of the world's supply of whale oil in 1917 was contributed by Norwegian companies; even in companies whose capital is in British or other hands the expert labour is almost entirely Norwegian.

*Types of Whale.*—The whales of the Falkland Is. Dependencies are chiefly the Blue whale (*Balaenoptera musculus*) which may reach 100 ft. in length and yields on an average 12 tons of oil, the Fin whale (*B. physalus*) giving 7 tons, the Humpback (*Megaptera nodosa*) with 5 tons, together with Right whales,

Sei and other species in far smaller numbers. During the years 1909–18 the mean annual numbers of all kinds taken was 8,197 and in some years the catch exceeded 10,000, while in the same period the total value of products rose from just over £250,000 to over £1,500,000.

*Danger of Over-Fishing.*—Unfortunately the very success of whaling brings its own dangers. One catcher has been known to bring to her station (Vancouver) 325 whales in seven months, and six whales in one short voyage. Thus the destructive effect of modern whaling exceeds immensely that prevailing in the Arctic or South Sea whaling of former times. In the Antarctic whaling mentioned the fishery has shown a tendency for the Humpback whales to figure less largely in the catch, and for the Fin whales which succeeded them to give place to Blue whales; and though, perhaps, this may be explained in part by the increasing facility with which improvement in ships and gear permits larger and more valuable species to be attacked, when coupled with the known history of several other whale fisheries it constitutes a *prima facie* case for inquiring whether, notwithstanding the rigid regulations of the fishery by limitation of catching power, the region is not being fished to the detriment of future supply.

*Scientific Investigations.*—Such fears have led to the launching of a comprehensive investigation into the whales, and the oceanic conditions affecting their growth, movements and abundance. Capt. Scott's "Discovery" has been practically rebuilt and as the royal research ship "Discovery," commissioned for the work, which is financed by the Falkland Is. Govt. and directed by a special committee appointed by the Colonial Office. It is impossible here to detail the wide field of investigation undertaken. The danger of exhausting the whale stock of (for instance) South Georgia clearly depends largely on whether the catch is drawn from a separate local race or from the fringe of a great circumpolar stock. An important part of the investigations consists in marking whales by discharging at them numbered discs, resembling drawing pins in shape, which fasten into the whale's hide. These marks when returned by the whaler on the ultimate capture of the whale will cast light on the creature's migrations and thus on the question referred to, and if sufficiently numerous on the rate of destruction. A vessel of whale-catcher type appropriately named "William Scoresby," will be employed in this work but will co-operate with "Discovery" in other ways. A laboratory has been placed on South Georgia for the use of the staff. The investigations, which will keep close touch with other expeditions, can hardly fail to yield results of great economic and scientific importance.

Pelagic whaling, in which the whales are treated at sea after being drawn up on a slipway let into the stern of a large floating factory, has been inaugurated. It is too early to learn whether this method, which can hardly approach existing methods in efficient use of materials, will be a financial success: but if successful and permitted unrestricted development it will clearly increase the danger of depletion.

Andrews, *Whale Hunting with Gun and Camera* (1916); *The Sei Whale*, American Museum of Natural History monographs, N. Series, vol. 1, pt. 6 (1916); *Report of Inter-departmental Committee on Research and Development in the Dependencies in the Falkland Islands*, Cd. 657 (1920); J. T. Jenkins, *A History of the Whale Fisheries* (1921); S. Risting, *Av Hvalfangstens Historie* (Oslo, 1922); C. B. Hawes, *Whaling* (1924); George F. Dow, *Whale Ships and Whaling* (1925). (J. O. B.)

**WHARTON, EDITH** (1862– ), American novelist, the daughter of George Frederick Jones, was born in New York City, but spent most of her later life in Italy and France. In 1885 she married Edward Wharton, a Boston banker, and in 1891 she began her literary career by contributing to *Scrivener's Magazine* a story entitled *Mrs. Manstey's View*. Her first long novel, *The Valley of Decision*, a not very interesting essay in historical romance, was published in 1902. *The House of Mirth* (1905) definitely established her reputation as inferior to Henry James' alone in the field which she and James together ploughed.

Her splendid sense of character, her ineluctable wit would have secured her a still higher place in literature if, owing to long residence abroad, she had not too often set her characters amid the frivolity of cosmopolitan society.

The best known of her later publications are: *The Fruit of the Tree* (1907); *Tales of Men and Ghosts* (1910); *Ethan Frome* (1911); *The Custom of the Country* (1913); *The Age of Innocence* (1920); *Old New York* (1924), and *The Mother's Recompense* (1925).

**WHEAT:** see GRAIN.

**WHEATLEY, JOHN** (1869–1940), British politician, was born on May 18 1869. Educated in village schools in Lanarkshire, he worked in the coal mines till 1891. After serving two years on the Lanarkshire county council, he was elected to the Glasgow city council in 1912, becoming a baillie, and acting as leader of the Labour group. He was also chairman of the Scottish National Housing Council. In 1922 he was elected M.P. for the Shettleston division of Glasgow. A member of the Independent Labour party from 1908, he was on its administrative council in 1923 and 1924. As Minister of Health in the Labour Govt. he was responsible for the Housing Act of 1924, which provided for a continuous building programme over a period of 15 years, designed to secure the erection of 2,500,000 houses to be let at rents within the means of the working class. In a large number of pamphlets, and through journalistic articles, Mr. Wheatley set out what is known as a left wing view of British Labour policy.

**WHITE, ANDREW DICKSON** (1832–1918), American educationalist (see 28.599), died at Ithaca, N.Y., Nov. 4 1918. His later works included *Seven Great Statesmen in the Warfare of Humanity With Unreason* (1910) and *The Work of Benjamin Hale* (1911). In 1913 he published a new edition of *The Warfare of Science and Theology in Christendom*.

**WHITE, EDWARD DOUGLASS** (1845–1921), American jurist, was born on a plantation in the parish of Lafourche, La., Nov. 3 1845, his father being 7th Governor of Louisiana. He was educated at Mount St. Mary's, Md., Georgetown (D.C.) College, and, after the outbreak of the Civil War, at the Jesuit College in New Orleans. During the latter part of the year he served as a private in the Confederate army. He studied law in the office of Edward Bermudez, later Chief Justice of Louisiana, was admitted to the Bar in 1868, and practised law in New Orleans. In 1874 he was elected to the state Senate, and four years later was appointed associate justice of the Louisiana Supreme Court. In 1891 he was elected to the U.S. Senate, and before completing his term was appointed, in 1894, associate justice of the U.S. Supreme Court by President Cleveland. In 1910 he was appointed Chief Justice by President Taft. Many of his notable opinions were delivered in connection with the Sherman anti-trust law. Of special importance were his opinions requiring the dissolution of the Standard Oil Co. and the American Tobacco Co. in 1911. As Chief Justice he administered the oath of office to President Wilson in 1913 and 1917, and to President Harding in 1921. He died at Washington, D.C., May 19 1921.

**WHITE, SIR GEORGE STUART** (1835–1912), British soldier (see 28.599), died in London June 24 1912.

**WHITE, SIR WILLIAM HENRY** (1845–1913), British naval architect (see 28.602), died in London Feb. 27 1913.

**WHITEAVES, JOSEPH FREDERICK** (1835–1909), British palaeontologist (see 28.602), died at Ottawa, Canada, Aug. 9 1909.

**WHITE RUSSIA** (see RUSSIA 23.869).—The White Russian Socialist Soviet Republic was established by a decree of the All-Russian Central Executive Committee on Feb. 5 1919, and its relations with the Russian Socialist Federated Soviet Republic were regulated by a treaty signed on Jan. 16 1921 until the adoption of the constitution of the Union of Socialist Soviet Republics in 1923, when the White Russian Republic became a constituent State in the Union. Its territory lies in the centre of the Western frontier of the Union opposite Poland (see RUSSIA).

The Republic covers 52,398 sq. versts, and has a population of 1,730,846, of whom 274,070 are classified as urban. The average density is just over 30 persons to the square verst. The capital

is Minsk (population 105,834). The country is to a large extent composed of forest and marsh, and is not productive. The timber trade is being developed, and although a certain amount of grain is grown it is insufficient for home needs. There are practically no industries. The main Moscow-Warsaw line passes through the republic with an important station at Minsk, from which branch lines go to Vilna and Bobruisk. A main road from Brest-Litovsk to Moscow also passes through Bobruisk. There are two institutions of quasi-university standing at Minsk.

**WHITE SLAVE TRAFFIC** (see PROSTITUTION, 22.457).—The movement for the suppression of the international traffic in women and children for immoral purposes may be said to some extent to date from the attempt, in the middle of the 19th century, to introduce what may be described as a system of State regulation of vice into England. This system owed its introduction to the remarkably high incidence of venereal disease at that period among soldiers and sailors, and as a result, in 1864, the first of the Contagious Diseases Acts was passed (see 22.462).

*Steps Taken Before 1920.*—At that time in Europe there appear to have been, as there still are, two bodies of opinion; in some countries the State recognised prostitution as a necessity which could not be overlooked, but which called for control by registration and sanitary supervision; in other countries a strong body of opinion favoured no such recognition. In 1875 a meeting was called by Josephine Butler in Geneva to consider white slave traffic from its international aspect and in its relation to state regulation, and as a result the International Federation for the Abolition of State Regulation of Vice was formed. In 1898 and 1899 William Alexander Coote, the Secretary of the National Vigilance Association of Great Britain, visited Germany, Holland, Belgium, France, Russia, Switzerland, Spain, Austria and the Scandinavian countries, and in the capital of each organised a national committee for the suppression of white slave traffic. An international congress was therefore held in London in June 1913, and at that congress the International Bureau for the Suppression of White Slave Traffic was constituted to co-ordinate the work of the national committees. The French Government had called an official conference in Paris in 1904, and an international agreement was drafted, under which the signatory Powers undertook to appoint a central authority in each country charged with the co-ordination of all information relative to the traffic. The signatories undertook to ensure vigilance at ports and railway stations, to notify the arrival in each country of suspected persons, to take declarations from alien prostitutes, to protect and maintain the victims of the traffic pending repatriation (for which they also took the responsibility) and to supervise registry offices or agencies engaged in finding employment for women and girls abroad.

In 1910 a second governmental conference was called in Paris. A convention drawn up after this conference provided for the punishment of procurers for immoral purposes of girls and women, either minors or of full age, in whatever country the various acts constituting the offence might be committed. It provided also for the enactment, in those countries where needed, of the necessary legislation. In addition to the official conferences mentioned, the International Bureau was instrumental in calling together conferences and congresses in various parts of Europe, and it is greatly due to the enterprise of this body and the national committees affiliated to it, that so much has been done to limit the extent of the traffic.

#### THE WORK OF THE LEAGUE OF NATIONS

Such was the preliminary work done before the League of Nations came into existence on Jan. 10 1920. Article 23 (3) of the Covenant states that Members "will entrust the League with the general supervision over the execution of agreements with regard to the traffic in women and children." On the decision of the First Assembly of the League, a questionnaire was sent to all Governments to ascertain the measures taken or proposed in the various countries to put an end to the traffic. The Council of the League was also invited to convene an international conference. Thirty-four States were represented at this conference, which was held in Geneva from June 30 to July 5 1921. To it were invited, not only States parties to the previous international engagements, but all States willing to take part, and the meetings were open to the public. The conference examined the replies to the questionnaire, and a Final Act was adopted containing a number of recommendations requiring action by Governments. This Final Act was approved by the Council and, in Sept. 1921 the Assembly invited all Governments to authorise their delegates to sign forthwith a Convention submitted by the British Govt. in which many

provisions of the Final Act were given conventional form. This Convention was open for signature on Sept. 30 1921; it has been signed by 33 States, 27 of which (including the British Empire, the Dominions of Australia, Canada, New Zealand and South Africa and India) have up to the present time ratified the Convention. Twenty-five British colonies and dependencies and the territory of Iraq (British mandated territory) have adhered.

The new Convention was not intended to replace the earlier instruments, but to supplement only, and it is for that reason that the first Article prescribes that the High Contracting Parties, if not already parties to the Agreement of 1904 and the Convention of 1910, shall ratify or adhere to them without delay. Other new provisions in the Convention are that the punishments prescribed under the Convention of 1910 for those who traffic in women and girls are made applicable to those who engage in the traffic of children of either sex. The punishment is required not only of those guilty of offences committed, but of attempts to commit the offence and, within legal limits, of acts preparatory to the committing of such offence. The minimum age under which it is an offence to procure a woman for immoral purposes, even with her consent, previously fixed at 20, is raised to 21. In addition, the provisions of the Convention of 1921 relating to extradition go further than those of the Convention of 1910, the Parties agreeing that in cases where no extradition convention exists between two countries, they will take all measures in their power to extradite or provide for the extradition of persons accused or convicted of certain offences specified under the Convention of 1910. They also undertook to prescribe such regulations as are required for the protection of women and children seeking employment in another country, if they had not already done so.

**The Advisory Committee.**—Another outcome of the Conference of 1921 was the setting up of an advisory committee to the Council on all matters relating to the traffic in women and children. This committee sat for the first time in June 1922. It was composed of delegates of Governments, and of assessors appointed by international voluntary organisations. During its four meetings it had under special consideration the questions of employment of women abroad by theatrical, variety, concert and cinema agents; the moral welfare of women and children on emigrant ships; the consideration of the system of licensed houses; the employment of women police, and the consideration of the laws and regulations in force in the various countries for the suppression of the traffic.

Of these questions, one which has been given much importance is that of the system of the licensed house. Though it may be maintained that the regulation of vice in any country is purely an internal and national question, it was the opinion of a large number of members on the advisory committee that the licensed house stimulates immorality and encourages an international trade to supply a certain market. The committee gave special attention to the subject, and as a result of its investigations, the Council "recognising the connection which may exist between a system of licensed houses and the traffic in women and children," invited States which had abandoned the system to explain the motives of their decision in abandoning it, in so far as they concern the traffic; and States which still maintain the system to indicate whether their experience leads them to believe that the system encourages the international traffic or otherwise.

The majority of answers received appear to indicate a strong movement for the abolition of the licensed house system, which some of the new States created by the Treaty of Versailles adopted and subsequently abandoned. The reasons given by these States and others for this abolition are various. It is said, for example, by some that the system has not justified expectation, and has tended to disseminate rather than diminish venereal disease. It is the opinion given by more than one State that the licensed brothel has proved itself to be a permanent factor in the traffic in women and children, in fact that the traffic owes its very life to the existence of the licensed brothel. The Dutch Govt., in stating the reasons for the abolition of the system of regulation in that country, state that experience has

shown that the traffic depends on the existence of the licensed brothel and that its abolition has almost killed the traffic. On the other hand certain countries, in replying, say that they maintain the system in the interests of public health. This is sometimes qualified by the statement that there is an obvious contradiction existing between the system of tolerance and the higher end of the State, or that the State has decided to give the matter serious attention in view of the growing public opinion in favour of abolition, and in other reports it is said that although the system is maintained, a scheme is in course of preparation for its suppression. The evidence, however, is far from complete.

**An Expert Investigation.**—In order to ascertain the extent of the world traffic, the routes which it follows and the individuals or organisations connected with it, a small body of experts was nominated to make a world investigation on the spot with the consent of and in conjunction with the Governments concerned. During 1924 and 1925, between 30 and 40 countries were visited.

**BIBLIOGRAPHY.**—*Reports of the International Conference on Traffic in Women and Children* (Geneva, 1921); the *Reports of the League of Nations Advisory Committee on Traffic in Women and Children* (5 sessions, 1922, 1923, 1924, 1925, 1926). (R. Cr.)

**WHITLEY COUNCILS:** see INDUSTRIAL RELATIONS.

**WHITLOCK, BRAND** (1866– ), American diplomat and writer, was born at Urbana, Ohio, March 4 1869. He was elected mayor of Toledo in 1905 and was re-elected for three succeeding terms, but in 1911 declined the nomination for a fifth term. In 1913 he was appointed U.S. minister (later ambassador) to Belgium. Before he had been in Belgium a year the World War broke out and the German invasion took place. Although the other diplomatic bodies followed the Belgian Court to Havre, Whitlock insisted on remaining in Brussels. It was largely due to his urgent advice that Brussels did not resist and thus escaped devastation. In the early days of the War he gave protection to many German residents who had been unable to leave the country. By his firm attitude toward the German military officials he saved many innocent Belgians from death; but his activities on behalf of Edith Cavell were unavailing as he was misled at the last moment through false promises by the Germans. After the formation of the Commission for Relief in Belgium, its operations were placed wholly under his direction. His ceaseless work on their behalf won the gratitude of all the Belgians. He resigned Feb. 1 1922. An account of the German occupation is given in his *Memories of Belgium under the German Occupation*, 2 vol. (1918).

Whitlock's other writings include *The 13th District: a Story of a Candidate* (1902); *Her Infinite Variety* (1904); *The Turn of the Balance* (1907); *Abraham Lincoln* (1909, in the *Beacon Biographies*); *The Gold Brick* (1910); *The Fall Guy* (1912); *Forty Years of It* (1914); *J. Hardin and Son* (1923), and *Uprooted* (1926).

**WHOOPIING COUGH:** see INFECTIOUS FEVERS.

**WHYMPER, EDWARD** (1840–1911), British artist, explorer and mountaineer (see 28.617), died at Chamonix Sept. 16 1911.

**WHYTE, ALEXANDER** (1837–1921).—Scottish divine (see 28.617), died at Hampstead, London, Jan. 16 1921. In 1915 he published *Thirteen Appreciations*.

**WIEN, WILHELM** (1864– ). German physicist, was born on Jan. 13 1864, at Gaffken (East Prussia). He studied at the universities of Königsberg, Freiburg and Berlin, and in 1890 entered the Physico-Technical Institute as assistant. In 1896 he was appointed professor at the technical high school, Aix-la-Chapelle; in 1899 he went to Giessen, and in 1900 to Würzburg. Wien's researches covered almost the whole sphere of physics. He wrote on optical problems; on radiation, especially the radiation of heat, for which in 1911 he was awarded the Nobel prize; on water and air currents; and on the transmission of radiation in rarefied gases (Cathode and Röntgen rays), which brought him in touch with modern high frequency technology. In 1913 he lectured at Columbia University in New York on problems of modern theoretical physics.

Wien was editor of the *Annalen der Physik* from vol. 21 (1906); His chief works are: *Lehrbuch der Hydrodynamik* (1900); *Neuere Probleme der theoretischen Physik* (1913); *Die Relativitätstheorie vom Standpunkte der Physik und Erkenntnislehre* (1921).

**WIGGIN, KATE DOUGLAS** (1857-1923), American novelist (see 28.626), died in London Aug. 24 1923. In accordance with her wishes her body was cremated, and the ashes scattered on the waters of the Saco river at Hollis, Me., Sept. 12 1923.

**WILAMOWITZ-MÖLLENDORFF, ULRICH VON** (1848- ), German philologist, was born on Dec. 22 1848 at Markowitz in Posen. He studied at Bonn and Berlin, and afterwards travelled in Italy and Greece 1872-4. In the latter year he took a post as lecturer in Berlin, and afterwards became a professor in Greifswald and Göttingen. In 1897 he was appointed professor of ancient philology in the university of Berlin. Wilamowitz proved himself not only an excellent editor and witty commentator on the Greek tragedies of Aeschylus, Euripides and Aristotile, but also a brilliant translator of Greek verse. Sharply attacked by Friedrich Nietzsche in his youth, Wilamowitz became one of the first authorities of modern times in the field of Greek philology.

Among his numerous works are: *Aeschyli Tragoediae* (Greek and German 1914); *Euripides Herakles*, with an introduction to the Greek tragedy and German annotations (1889); *Die Textgeschichte der griechischen Lyriker* (1900); *Bucolici Graeci* (Oxford, 1905); *Die Ilias und Homer* (1916); *Platon*, (1919); *Hellenistische Dichtung* (1924); *Griechische Verskunst* (1921); *Pindaros* (1922).

**WILBERFORCE, ALBERT BASIL ORME** (1841-1916), English divine (see 28.630), died May 13 1916.

**WILBRANDT, ADOLF** (1837-1911), German novelist and dramatist (see 28.631), died at Rostock June 10 1911. See E. Scharrer-Santen, *Adolf Wilbrandt als Dramatiker* (1912), and *Jahrbuch und Deutscher Nekrolog*, XVI., p. 84 (Totenliste 1911).

**WILBUR, RAY LYMAN** (1875- ), American educationalist, was born at Boonesboro, Ia., April 13 1875. He graduated at Stanford University in 1896, proceeding thence to Cooper Medical College, San Francisco (M.D. 1899), and later continuing his studies at London, Frankfurt and Munich. In 1909 he was appointed professor of medicine at Stanford University, becoming dean in 1911. In 1915 he was appointed president. He was chief of the division of conservation of the U.S. Food Commission, and a member of the California State Council of Defence 1917.

**WILEY, HARVEY WASHINGTON** (1844- ), American chemist, was born in Kent, Ind., Oct. 18 1844. He was educated at Hanover (Ind.) College (A.B., 1867; A.M., 1870), Indiana Medical College (M.D., 1871) and Harvard (B.S., 1873). He was professor of Greek and Latin at Butler College, Indianapolis (1868-70); state chemist of Indiana and professor of chemistry at Purdue University (1874-83); and chief chemist of the U.S. Dept. of Agriculture (1883-1912). From 1899 he was professor of agricultural chemistry at the George Washington University. He was specially interested in preventing food adulteration, and antagonised many food packers, who in 1911 unsuccessfully exercised political pressure to obtain his dismissal from the Dept. of Agriculture on the technical charge that an expert in his department had received recompense exceeding the legal rate. President Taft wholly exonerated him. Dr. Wiley resigned in 1912, thereafter devoting himself largely to the cause of pure food by lecturing and writing.

His numerous publications include *The Sugar Industry of the United States* (1885); *Principles and Practice of Agricultural Analysis* (1894-7; revised edition, 1906-14); *Foods and Their Adulterations* (1907, third edition, 1917); *The Lure of the Land* (1915), and *Beverages and Their Adulteration* (1919). He also edited a series of *Health Readers for Schools* in 1919.

**WILLARD, DANIEL** (1861- ), American railway official, was born at North Hartland, Vt., Jan. 28 1861. He studied for a year at the Mass. Agricultural College, Amherst, and in 1879 began his railway career as a track labourer in Vermont. He rose to fireman, then to engineer, and for years held various positions on the Minneapolis, St. Paul and Sault Ste. Marie; Baltimore and Ohio; Erie; Chicago, Burlington and Quincy; Colorado Midland and Colorado and Southern railroads. In 1910 he was elected president of the Baltimore and Ohio. In Oct. 1916, he became a member of the advisory commission of the council of national defence, and the following March chairman of the com-

mission. He was appointed in July 1917, a member of the special committee of the council of national defence to secure mediation in case of strikes on war contracts. In Nov. 1917, he was appointed by President Wilson chairman of the War Industries Board. In Jan. 1918, he resigned in order to devote his personal attention to the Baltimore and Ohio Railroad. After the Government had taken over the railways as a War measure he was displaced as operating head of his road, but remained president in charge of its corporate affairs, in which position he continued when the U.S. Govt. gave up control of the railways.

**WILCOCKS, SIR WILLIAM** (1852- ), British engineer, was born in India and educated at Roorkee College, India. From 1872 to 1897 he was engaged successively in the Indian and Egyptian Public Works Departments. He designed and carried through the Aswan Dam in 1898, and for this work the C.M.G. was conferred upon him, followed by the K.C.M.G. in 1902. His most important undertaking, however, was the irrigation of Mesopotamia, begun in 1911 at an estimated cost of £26,195,000. The scheme provided for the irrigation of 3,500,000 acres. His published works include *Egyptian Irrigation* (1889); *The Irrigation of Mesopotamia* (1905) and *From the Garden of Eden to the Crossing of the Jordan* (1918). In March 1921 he was found guilty by the supreme consular court of Egypt of sedition and criminal libel in respect of statements concerning the data in connection with the Nile irrigation scheme, and was bound over to be of good behaviour for one year.

**WILLETT, WILLIAM** (1856-1915), British builder, was born at Farnham, Surrey, in Sept. 1856. He made a name for himself in London as a designer of beautiful houses; but his chief claim to fame was his conception and promotion of the system of "daylight saving." Though scoffed at in his lifetime, his idea was taken up and put into practice in 1916, and honour has been paid to Willett's memory, which was denied to him in life. He died at Chislehurst, Kent, March 4 1915. (See DAYLIGHT SAVING.)

**WILLIAM** (1882- ), late Crown Prince of Germany, eldest child of William II. of Germany, was born at the Marble Palace, Potsdam, on May 6 1882. He began his military career by serving in the 1st Foot Guards, and accompanied the Kaiser to England (Jan. 19-Feb. 5 1901) on the occasion of the funeral of Queen Victoria. On June 6 1903 he married the Duchess Cecilia, sister of the Grand Duke of Mecklenburg-Schwerin. There were five children, four sons and one daughter, of the marriage. His political and personal interventions in public affairs gave some trouble in the years preceding the War. He was credited with pan-German sympathies, and on one occasion (Nov. 9 1911) he appeared in the royal box in the Reichstag during the debate on the Morocco settlement and demonstratively applauded speakers who were attacking Great Britain and the Imperial Chancellor, Bethmann-Hollweg. He was afterward compelled by the Emperor to make amends to the Chancellor. On the occasion of the conflict in Dec. 1913 at Zabern in Alsace between officers of the garrison and the civilian population, he dispatched telegrams encouraging the officers in their truculent attitude. In 1910-1 he paid a visit to Ceylon, India and Egypt, and he published some account of his experiences in his *Jagdtagebuch*.

On the outbreak of the World War the Crown Prince was appointed to the command of the V. Army in the west. In Sept. 1915 he received the command of an army group, and he was nominally in charge of the German operations against Verdun. His flight to Holland speedily followed that of the Emperor in Nov. 1918, and he went to Wieringen, an island in the Zuider Zee. He formally renounced on Dec. 1 1918 his rights of succession to the crowns of Prussia and the German Empire. The ex-Crown Princess and her children, however, continued to reside at Potsdam. Although credited with remaining in touch with the Monarchists in Germany, the ex-Crown Prince took little active part in this movement. His father was the national object of the strict legitimist sympathies while William was too closely involved in his father's fate and unpopularity to be able to head a rival movement of his own. On Nov. 10 1923 he suddenly returned to his estate at Oels in Silesia. There was strong feeling in France that the German Govt. should be com-

pelled to surrender him, but the matter was settled by a German note which stated the act of renunciation of the ex-Crown Prince and declared that it would not permit the return of the Kaiser. The Allied Powers declared that they would hold Germany responsible for any consequences which might arise, but the ex-Crown Prince himself declared that he would take no part in politics. His memoirs, *Ich suche die Wahrheit* were published in 1922.

**WILLIAM II.** (1859– ), until 1918 German Emperor, was born at Berlin on Jan. 27 1859, the eldest son of Prince Frederick of Prussia, afterwards Crown Prince and second German Emperor, and of Victoria, Princess Royal of Great Britain and Ireland.

At the time of his birth William received an injury to his head and left side that rendered his left arm permanently useless, an event that was to have an important effect upon his character and thereby upon the future of Germany and the world. As a Hohenzollern prince, and still more as heir to the throne, he was destined for a military career. Yet in this career his useless arm would more patently handicap him than in any other. Hence there entered into his personality what would now be termed an "inferiority complex," to overcome which he asserted himself to the uttermost, so that in the event he became arrogant and self-assertive even when he had no occasion to be so. Because he seemed manifestly unfitted for the army, he determined all the more to make himself an efficient soldier. With the exception of three years spent at the gymnasium at Cassel and two more at the University of Bonn his early years were entirely occupied in military training and duties—he became a second-lieutenant in the First Regiment of the Guards at the early age of 10 years. Hence when he ascended the throne on June 15 1888 he did so thoroughly imbued with militaristic ideas, and in the belief that "the soldier and the army, not parliamentary majorities, have welded together the German Empire. My confidence is placed in the army."

Prior to his accession he had made two friendships that were destined to affect profoundly his future career, and that serve to illustrate in their divergency his dual personality. Amidst army circles he had learnt to know General Count Waldersee, a bitter opponent of Bismarck and Bismarck's pro-Russian policy, from whose enmity with the great Chancellor may well have sprung the Emperor's own enmity with him. A Prussian prince and soldier, he found in Waldersee the prototype of the *alt-preussische* officer for whom there was but one loyalty—that of his oath to his king; and one path to national greatness—military victory. There was, however, another and very different side to William's nature—a side that sought expression in his dramatic journeyings over Europe; in his highly rhetorical speeches; in his very sincere love of music and art. Inherited from his Coburg grandfather, Albert the Prince Consort, the young Kaiser's strongly developed artistic and theatrical temperament demanded a more sympathetic *milieu* in which to expand than the society of Waldersee and the officers of the Potsdam garrison. And this is found in the Kaiser's friendship, which lasted more than 30 years, with Philip, Count (later Prince) zu Eulenburg-Hertefeld. In the diaries and letters of this remarkable man is to be found the fullest, most intimate portrayal of his Imperial friend's personality.

On ascending the throne William II. speedily found that Germany was not wide enough to contain two such spirits as his and Bismarck's. In theory the aged Chancellor conceded the supremacy in the government to the Emperor; in practice he had himself been the real ruler. But now there sat on the throne a ruler who was not content to rule merely in name. After a struggle that left behind it bitternesses that poisoned German political life for more than a generation, the Chancellor was dismissed and the young Emperor grasped with his own hands the helm of the ship of state. Despite gloomy forebodings, especially in Bismarckian circles, no disaster overtook the ship; on the contrary, she went forward prosperously for the first decade of the reign.

In the 'nineties, however, the Emperor made the discovery that the future of Germany lay on the high seas; a discovery that led to the long rivalry in naval armaments between the Empire and Great Britain and that was an important factor in bring-

ing about the World War. For once an idea had taken possession of the Emperor he was tenacious to the last degree in endeavouring to give practical expression to it. Hence he placed himself at the head of the Navy party, gave his support to von Tirpitz, and telegraphed to Prince Henry of Prussia: "I will not rest until I have brought my navy to the same height at which my army stands." This policy of naval and also of colonial expansion inevitably brought Germany into conflict with the British Empire; but the Emperor's outbursts of ill-humour against this country are chiefly to be ascribed to his dislike to having his desires frustrated rather than to any inherent personal animus against the English. From his earliest years he had been brought up to have his slightest wish regarded as a command, to be instantly obeyed; and as years passed by his position as ruler over a greatly prospering nation did nothing to eradicate his egotism.

In foreign policy the Emperor pursued a less spectacular path in the first decade of his reign than had been anticipated. He was conciliatory towards France; he courted Russia, whose rapidly growing intimacy with France gave cause for alarm to the Wilhelmstrasse; and he paid a theatrical, yet in its practical results eminently valuable, visit to the Sultan of Turkey in 1889. The East, indeed, made a strong appeal to his temperament, and he did much to intensify the "Drang nach Osten" by which Germany shortly afterwards became animated. Until the dispatch of the celebrated telegram to President Kruger on Jan. 3 1896, after the failure of the Jameson Raid, Anglo-German relations had been friendly, even cordial, since the Emperor's accession; and at one time the basis of a possible *entente* was under discussion. But after the episode of the telegram a change took place; the two countries gradually drifted apart until, with the growth of the German Navy, rivalry began to spring up between them.

In the second decade of his reign events occurred presaging the coming of the catastrophe that was to mark its final days. There was the episode of the Björkö Treaty, July 23–4 1905, in which the Emperor sought to detach the Tsar from his French alliance by pledging him to give, if necessary, his armed support to Germany—an attempt that ended in failure because Prince Bülow was willing to regard the treaty, which the Tsar had actually signed without consulting Count Lamsdorff, the Russian Foreign Minister, as being *non avenue*.

Two years later came the famous incident of *The Daily Telegraph* interview (Oct. 28 1908), in which the Emperor inveighed against the Anglo-Japanese alliance and declared that Germany "must be prepared for any eventualities in the East"; a declaration that was promptly disavowed by Prince Bülow, who forced his Imperial master to promise publicly that in future he would refrain from such intrusions into the realm of foreign policy. The storm raised in Germany by the publication of this interview nearly cost the Emperor his throne; for some weeks talk of his abdication was rife, and he became the sport of every caricaturist in Germany. Eventually the storm blew over, leaving the Kaiser unchanged in his autocratic disposition: "If another such opportunity comes, then I will no longer act in a constitutional manner."<sup>1</sup> If it left the Kaiser unchanged, except in his people's regard for him, the storm destroyed Bülow, whose resignation followed in 1909. With his departure the last controlling influence over the Kaiser was removed, and that ill-balanced, if gifted, monarch was left to fall a victim to the counsels of militaristic advisers. As Holstein, who died in 1908, had said when entreating Bülow to remain in office: "If you resign, war will be inevitable."<sup>2</sup>

The year 1908 was indeed a decisive year in the Emperor's life. For 20 years he had ruled over an empire that had steadily waxed materially more prosperous. For 20 years he had been the central, though by no means the most important figure, in the political life of Europe. Now in the space of a year all was changed. For a second time the work he had sought to accomplish at Björkö was destroyed when the Tsar and King Edward VII.

<sup>1</sup> Graf Robert von Zedlitz-Trützschler, *Zwölf Jahre am deutschen Kaiserhof*, 1923, p. 239.

<sup>2</sup> Emil Ludwig, *Wilhelm Der Zweite*, 1926, p. 381.

met at Reval in June. As a politician he had been proved no match for his uncle, for whom he now entertained a very hearty dislike. As a ruler he had made himself ridiculous in the eyes of his own people because of the flagrant contrast between his professions and his deeds. For the first time in his reign, perhaps for the first time in his life, the Emperor experienced the chilling sensation of unpopularity. The way in which he met it was but a prelude to the days of Nov. 1918; he went hunting with the ill-fated Archduke Francis Ferdinand, and wired to Bülow from Vienna at a time when the Reichsrat was debating his conduct: "The two days here passed very harmoniously and happily... the hunt went splendidly. I laid 65 deer low. I remember you always in my prayers morning and evening. They lift us above all human hatred and envy! There is a silver lining (sic) to every cloud. God be with you! In old friendship. William I.R."<sup>1</sup>

Between 1908 and 1914 the storm clouds overhanging Europe frequently threatened to break. At times it seemed as if the German Emperor were bent on provoking the catastrophe; at other times he seemed to be doing his utmost to avert it. Aehrenthal's *coup* in the annexation of Bosnia-Hercegovina in Oct. 1908 aroused the Kaiser's fury no less than that of Izvolsky. "Vienna will be accused of duplicity," he wrote on the margin of the dispatch in which he learnt of the annexation, "and with reason. It has duped us shockingly. I have been cut to the heart in my feelings as ally, simply a felony in the thanks of the House of Habsburg."<sup>2</sup>

The Turkish revolution followed speedily on the annexation crisis. With amazing inconsistency the autocratic Emperor welcomed this latest achievement of democracy. On the margin of a dispatch in which Marschall von Bieberstein, writing from Constantinople, commented on the conduct of the Sultan's courtiers who, owing all to him, nevertheless deserted him in the hour of crisis, the Kaiser in words prophetic of the circumstances attending his downfall wrote: "Thus do creatures of the court always behave! Not only among the Turks but also among us Christians."<sup>3</sup> With the fall of Bülow the influence of the military party, and especially of von Tirpitz, grew from day to day. The competition between England and Germany in naval armaments became keener and keener. Repeatedly urged by Bülow to come to an understanding with England on the naval question, the Kaiser invariably replied in words he used to King Edward: "It (the naval programme) will be adhered to and exactly carried out, without any restrictions."<sup>4</sup>

In 1912 Lord Haldane visited Berlin in the hope that even at that late hour some *modus vivendi* might be found as between the two countries, but without result, though the Kaiser, perhaps to impress his visitor, played the part of a constitutional monarch in the discussions that ensued. By now, however, it was too late to undo the work accomplished in the previous 20 years. Already, as Sir Edward (later Viscount) Grey observed to Count Metternich, Europe was divided into two camps. The responsibility for the existence of that division must in part fall upon the Kaiser's shoulders.

The years 1912-4 were filled with wars in the Balkans and rumours of wars elsewhere. Perhaps at last some vision of what lay ahead of Germany were she to pursue her present path became apparent to the Emperor, for he constantly in these years reiterated his desire for peace. Constantly he warned Bethmann Hollweg against the dangers into which Germany might be led by a warlike Austria, "which might be the ruin of Germany—all because of Albania and Durazzo."<sup>5</sup>

When, however, he was at last confronted with the imminent outbreak of that World War to which events had been leading up for a quarter of a century the Kaiser lost his nerve. On first learning of the murder of the Austrian Archduke and his

wife at Sarajevo he was filled with fury against Serbia, which he declared was not "a State in the European sense, but a robber band."<sup>6</sup> The sanctity of the monarchical principle had been violated; and true to his conception of kingship as a divine institution the Emperor called for vengeance upon the murderers and the nation to which they belonged. Nor did the imminence of a European war at first appall him. On the margin of a dispatch in which Grey was reported as speaking of the danger of a European war he wrote: "That will certainly come."<sup>7</sup> Indeed, during that fateful July preceding the outbreak of War the Emperor found himself caught between the horns of a dilemma from which it might well have puzzled an abler man than he—and he was an able man—to escape. For years he had played the war-lord before the eyes not only of all Europe but before those of the German nation and the military clique. Now that war had become imminent, could he dare risk playing the peacemaker? Might not his throne, if not his life, be endangered were he to seek to oppose the militarists whose plans he had long encouraged at the very moment when the long-awaited opportunity for putting them into execution had arrived? As he thus hesitated, there came the news of the Serbian reply to the Austrian ultimatum, and as he read it the Emperor was quick to see a possible way of escape from his difficulties. "A brilliant result for a delay of 48 hours," he declared. "That is more than one could expect. A great moral success for Vienna; but with it every occasion for war disappears."<sup>8</sup> Unhappily, the Kaiser's advisers proved him a false prophet; and indeed before many days had elapsed he was again possessed by a war-frenzy. At the great Crown Council at Potsdam on July 29 the decision was taken in favour of war.

In the War the Kaiser's mercurial temperament was recognised, as a danger by the military leaders of Germany. He was gradually but effectively side-tracked, and the real control of affairs passed into the hands of men like Ludendorff, Hindenburg and Falkenhayn. In 1918 as the end approached it became obvious that a revolution was imminent. Hindenburg, who treated the Emperor with scant respect, informed him that even the troops could not be relied upon in event of a civil war, and urged him to abdicate. At first the Emperor protested his duty to Germany, but finally gave way, abdicating as German Emperor but not as King of Prussia. The Berlin Government had anticipated such a move and had already announced his abdication of both thrones. After some hesitation he agreed to seek safety in Holland, and he crossed the frontier on Nov. 10, the day after the revolution broke out in Berlin. At first he was the guest of Count Bentinck at Amerongen; subsequently he purchased for himself a property at Doorn. The Empress (Augusta Victoria), who joined him at Amerongen, died at Doorn on April 11 1921. She was a daughter of Frederick, duke of Augustenburg and was married Feb. 27 1881. They had issue, six sons and one daughter. On Nov. 5 1922 the ex-Emperor married Princess Hermine of Reuss, widow of a German prince. (See also GERMANY: HISTORY.)

**BIBLIOGRAPHY.**—For an understanding of William II.'s character no book exceeds in interest or importance Johannes Haller's *Aus dem Leben des Fürsten Philipp zu Eulenburg-Ilterfeld* (Berlin, 1924); Emil Ludwig's *Wilhelm II.* (1926), besides being a brilliantly written account of the Emperor's life, has done more than any other single volume to destroy the respect for monarchy entertained by the German people: it is, however, highly coloured and exaggerated. Among other books may be mentioned Bismarck's *Reflections and Reminiscences*, 3 vol. (1898 and 1921); Prince Hohenlohe's *Memoirs* (1906); Otto Hamman's *Um den Kaiser* (1919); *Der Neue Kurs* (1918); Graf Robert von Zedlitz-Trützschler, *Zwölf Jahre am deutschen Kaiserhof* (1924); Lady Norah Bentinck, *The ex-Kaiser in Exile* (1921); Walther Rathenau, *Der Kaiser* (1919); Baron von Eckardstein, *Lebenserinnerungen und politische Denkwürdigkeiten* (1919-20); H. von Moltke, *Erinnerungen*, etc. (1922); A. von Tirpitz, *Erinnerungen* (1919-20); A. von Waldersee, *Denkwürdigkeiten* (1922-3); *Die Grosse Politik der Europäischen Kabinette* (1921-5); *Die Deutschen Dokumente zum Kriegsausbruch* (1919).

**WILLSTÄTTER, RICHARD** (1872-1951), German chemist, was born in Karlsruhe Aug. 13 1872. He studied chemistry in Munich, and in 1896 became a lecturer in that city. In 1905 he was appointed an extraordinary professor in Zürich. In 1912 he went as ordinary professor to Berlin, and there became a member of the Kaiser Wilhelm institute of chemical research. In 1916 he resumed his activities in Munich. Willstätter's chief researches are connected with alkaloids (atropine and cocaine), also with aniline dyes (aniline black) quinones, and with vegetable colouring matters, particularly those of the flower and the leaf. These investigations led him to pursue researches concerning the assimilation of carbonic acid by plants, and also in connection with chlorophyll which he carried out in conjunction with A. Stoll. Latterly he devoted himself to extensive and successful experiments in connection with ferments. In 1915 he was awarded the Nobel Prize for chemistry.

**WILMINGTON, Del., U.S.A.** (see 28,690), with a population of 110,168 in 1920, of whom 10,746 were negroes and 16,307 foreign born, contained almost half (49.4%) of the population of the State; for 1925 the census bureau estimate was 122,049. The output of factories within the city, which do not include the Du Pont works, six miles away, was valued at \$38,060,000 in 1900; \$121,040,000 in 1919; \$54,539,453 in 1921; \$80,016,372 in 1923. After the World War the city undertook the construction (cost \$3,100,000) of a marine terminal, with ample modern facilities, and 25 ft. of water, ultimately to be increased to 35 ft., which was opened in June 1923. It is connected with the business section of the city by a reinforced concrete highway. A joint city hall and county building was completed in 1914; a civic centre (Rodney square) in the business section, in 1915; a new building for the free library, in 1923. The park area was increased to 702 ac. by 1925, and a zoning ordinance was adopted in 1924.

**WILNO:** see VILNA.

**WILSON, SIR HENRY HUGHES** (1864-1922), British soldier, was born at Edgeworthstown, County Longford, Ireland, on March 5 1864, and educated at Marlborough and Sandhurst. He joined the Rifle Brigade in 1884 and in 1894 he married a daughter of Mr. G. C. Wray. From the outset he was a serious and an ambitious soldier, and while his natural gaiety of disposition made him a welcome companion everywhere, his industry soon attracted the attention of his superiors. He was indeed, almost from the first, one of those men who could not be overlooked. His earliest experience of active service was in Burma between 1886 and 1888, and when the Boer War broke out in 1899 he had passed through the Staff College and become a brigade major at Aldershot.

Before that war ended Wilson was brought back to the War Office, when in the newly formed staff duties directorate it was his especial task to study and to apply the lessons which were learned in South Africa—of which the chief perhaps was the necessity of organising the British Army on something approaching continental lines and establishing a general staff for the study and application of the principles of war. In the work of reform Henry Wilson played a great, if still subordinate, part and it was no surprise when, in 1906, he was appointed to succeed Rawlinson as commandant of the Staff College at Camberley. Himself an inspiring teacher with the Irishman's birthright of eloquence, he gathered around him a group of young officers upon whom he impressed his own views and his own system. More than all he became himself impressed with an almost overpowering sense of the imminence of war between France and Germany. The Entente was already in existence, and if it were to mean anything, at all must carry with it grave military responsibilities. Wilson, therefore, established close relations with the French Staff College, and particularly a close personal friendship with its commandant, Ferdinand Foch, whose great work *Les Principes de la Guerre* (*The Principles of War*) became a textbook in this country. Under his influence Wilson became more and more convinced of the danger which was threatening Europe, and spent much of his leave in making himself thoroughly acquainted with every detail of the Franco-German frontier.

In 1910 he left the Staff College to succeed Sir W. Robertson as Director of Military Operations, while Robertson took Wil-

son's place at Camberley. It was one of the minor tragedies of the War that these two outstanding personalities were never quite able to act in unison. In Whitehall, Wilson concentrated the labours of his directorate upon what he believed to be the vital field of operations. Incidentally he was one of Lord Roberts' most ardent supporters in his campaign for national training. Thus, while British statesmen were striving for peace, the director of military operations, acting under the chief of the Imperial General Staff, was step by step perfecting the nation's preparations for war. While the political leaders of France and Britain were unable to enter into an alliance, soldiers were not only at liberty but were compelled, unless they were to neglect their manifest duty, to think out in consultation every detail of mobilisation and strategic concentration. At each step he had the cordial support of the other directors, with the result that in Aug. 1914 the British War Office was in a position to bring off the greatest strategical surprise of the whole war. Mobilisation was rapid and the Expeditionary Force was landed in France without the loss of a man or a horse, complete in every detail.

*The World War.*—In one important respect, however, there was a miscalculation. In common with almost everyone else Wilson had counted on a short war to be reckoned in months. It was generally accepted that no nation could stand the military and economic strain of modern war for long. Acting on this assumption the War Office was denuded of experienced staff, and when Lord Kitchener took office as Secretary of State for War he found hardly anyone in Whitehall upon whom he could rely. Wilson's own appointment in the field was deputy chief of the general staff under Sir Archibald Murray. Of all those who crossed from England with the British Expeditionary Force he was without doubt the best known in France, so much so that when the numbers of our troops increased the British Army Corps came to be referred to in French confidential documents as *C. d'A.W.* or *Corps d'Armée Wilson*. It was therefore natural that he should be appointed principal liaison officer with the French field headquarters, a post which he held until he took command of the IV. Army Corps towards the end of 1915.

Although deeply interested in the life and welfare of the private soldier, he never really made his mark as a commander. To some extent, no doubt, this was due to lack of opportunity, but still more to temperament and to mental development along other lines. Thus it was that early in 1917 he left the field armies for good and accompanied Lord Milner's mission to Russia. In Nov. 1917 he went to Versailles as British military representative on the newly-established Supreme War Council. Three months later, less than a month before the great German attack of March 1918, he once more succeeded Sir W. Robertson and this time as chief of the Imperial General Staff in London. He was one of those who supported Mr. Lloyd George in his efforts to secure unity of command on the Western front and strongly pressed the claims of his old friend Foch to be appointed commander-in-chief of the Allied forces in France and Flanders. Foch was actually appointed at Doullens, when the German advanced troops were within measurable distance of Amiens.

Wilson had always belonged to what became known as the Eastern school of thought rather than to the Western, and when the German advance had been checked he worked hard to re-establish that Eastern front which had been shaken by the Russian revolution and shattered by "General Hofmann's jack-boot," at Brest-Litovsk. When the Armistice was declared on Nov. 11 1918 he had attained the rank of general, and in the final honours for the War he was promoted field marshal, was given a baronetcy and received a grant of £10,000.

In his capacity as chief of the General Staff he was the principal military adviser of the Government during the prolonged negotiations at Versailles, and subsequently at numerous conferences. His mastery of language and effective manner of expressing in non-technical terms his views on technical matters no less than his charm of manner made him *persona grata* to ministers of state, and his intimacy with all the French superior commanders enabled him to make smooth many rough places.

*Parliamentary Career.*—Unfortunately, when the War was over, the troubles in Ireland came to a head and Wilson was a great Irishman. His position as chief of the Imperial General Staff, under a government with whose policy in Ireland he could not agree, became extremely difficult. Cordial relations became strained and old friendships were broken. When, in Feb. 1922, his tenure at the War Office came to an end he entered Parliament as member for North Down and at the same time he placed his military experience at the disposal of the Government of Northern Ireland. Seldom has a new member gone to Westminster better equipped. Debate, and especially criticism, came easily to him, for he was a ready and effective speaker with sufficient restraint to prevent him from discussion of subjects of which he did not possess special knowledge. His maiden speech was delivered on March 15 on the Army estimates and was followed at fairly frequent intervals by others on the Irish question. Here he quickly established himself as the most outspoken critic of those colleagues with whom in his military capacity he had worked so long, and in so doing he drew upon himself the hatred of his fellow countrymen in the 26 counties. On May 31 1922 he concluded a speech with the words:

I wonder when the moment will come when the Government will have the honesty and truthfulness to say, "We have miscalculated every single element in the Irish problem. We are exceedingly sorry for all the terrible things that have happened owing to our actions. We beg leave to return to private life and never to appear again."

He never spoke again in the House of Commons, for just three weeks later he was shot on his own doorstep in Eaton Place, London, as he returned from Liverpool Street Station after unveiling a memorial to the men of the Great Eastern Railway who had fallen in the War. It was a dastardly crime, as horrible in conception as in the occasion and manner of its execution. He was buried with full military honours in St. Paul's Cathedral.

Sir Henry Wilson's character is difficult to sum up. Essentially a critic, he nevertheless did great constructive work for the British Army and was, as much as any man, in Great Britain, the builder, though not the architect, of the Entente with France. Nevertheless he cannot be ranked with the greatest soldiers for he never held high command; in Parliament he at once achieved distinction, but did not live long enough to prove himself a statesman. Perhaps his greatest achievement was that at the most critical period in history, by his brilliant ability and compelling personality he bridged the gulf between the Government in London and the armies in the field, for he more than any other soldier had the confidence of the Prime Minister.

(N. M.\*)

**WILSON, JAMES** (1835-1920), American administrator (see 28.693), died at Traer, Ia., Aug. 26 1920.

**WILSON, THOMAS WOODROW** (1856-1924), 28th President of the United States, was born in Staunton, Va., Dec. 28 1856. The Scotch strain predominated in his ancestry, for his paternal grandfather came from County Down, in Ulster, and his maternal grandfather, Thomas Woodrow, a graduate of Glasgow, from Scotland. The stern Presbyterianism of his father, a minister of small means but marked capacity as a theologian, early influenced him and left an indelible mark upon his character. His early years were spent in Georgia and South Carolina, where he was deeply affected by the sufferings of the South during the reconstruction period. In 1875 he entered Princeton, graduating four years later. His record for scholarship in college was not remarkable, but he was prominent in debating and literary circles, and became student director of athletic sport. His most notable achievement was an article written in his senior year, and published in the *International Review*, which analysed unfavourably the procedure of Congress and formed the basis of his more mature political principles. After studying law in the university of Virginia and following a brief attempt to practise in Atlanta, he decided to pursue his studies in Government and history at Johns Hopkins University, where he received the degree of Ph.D. in 1886.

Wilson's thesis, entitled *Congressional Government* (1885), was a development of the attack upon Congressional methods, and

because of its clear and felicitous expression has been reprinted many times. In that year<sup>1</sup> he began his teaching career at Bryn Mawr College, where he was associate professor of History and Political Economy until 1888; after two years as professor of the same at Wesleyan, he entered the Princeton Faculty in 1890 as professor of jurisprudence and political economy. With slight changes in title he served in this capacity until 1902, when he became president of Princeton. As professor he rapidly achieved distinction. His lectures were remarkable for clarity of presentation and brilliancy of phrasing, and the same qualities characterised both his addresses and his published writings. His gift was for generalisation rather than plodding scholarship, and after the publication of his thesis his happiest literary efforts were in essay form. They display keen critical capacity, but are not remarkable either for erudition or for striking creative power. As president of Princeton, Mr. Wilson devoted himself to serious reforms of the educational and social habits of the undergraduates. In the hope of elevating the standards of scholarship and of increasing the efficiency of instruction, he inaugurated in 1905 the "preceptorial system," designed through small classes to bring teachers and students into the most intimate relationship. In his endeavours to democratise the social life of the university he met determined opposition. Further difficulties developed from a disagreement with the dean of the graduate college. Mr. Wilson's policies aroused warm controversy among alumni, faculty and undergraduates.

While at Princeton, both as professor and as president, Mr. Wilson displayed great interest in political questions of the day, and through his addresses and articles speedily won a national reputation. In Sept. 1910 he was tendered the Democratic nomination for governor of New Jersey. The offer, coming at the moment when the prospects for success of his policy at Princeton seemed most discouraging, secured his ready acceptance. Resigning his academic position he entered upon an active electoral campaign which won him the support of progressive elements throughout the state, despite the fact that his candidacy had been inaugurated largely under the auspices of the conservative Col. George Harvey (afterwards U.S. ambassador to Great Britain) and the Democratic state boss, Senator James Smith.

In Nov. he was elected by a plurality of 49,000 votes. He at once made it plain that he intended, regardless of the protests of machine leaders, to fulfil his liberal pledges and would assume the leadership of the party for this purpose. As governor he successfully carried through a series of reform measures. Of these the most significant were: a Direct Primaries Law, which, supplemented by an effective Corrupt Practices Act, did much to purify the political atmosphere of New Jersey; an Employers' Liability Act; the creation of a Public Utilities Commission; reform in municipal administration, making possible the adoption of the commission form of government. Elections to the state Senate and Assembly in 1911 gave the Republicans a majority in both Houses and the legislative output was curtailed. Nevertheless his final activities as governor were characterised by the impetus which he gave to the passage of a series of bills, known as the Seven Sisters, directed to the protection of the public from exploitation by trusts.

When in June 1912 the Democratic National Convention met at Baltimore to choose a candidate for President, Mr. Wilson's reputation as an effective reformer had brought his name prominently before the delegates. The convention was apparently controlled by conservative elements and there seemed little chance of the nomination of an anti-machine progressive. But as the struggle to secure the necessary two-thirds vote proceeded, with the conservative forces divided between Champ Clark, Harmon and Underwood, Mr. W. J. Bryan, leader of the progressive elements, threw his dominating influence in favour of Mr. Wilson. It proved decisive, and on the 46th ballot he was nominated, July 2 1912. In the campaign that followed he voiced popular discontent with the conservatism of the Republican

<sup>1</sup> In 1885 he married Ellen Louise Axson, of Savannah, Ga., who died in 1914, leaving three daughters. On Dec. 18 1915 he married Edith Bolling Galt, of Washington, D.C.

administration, which he believed to have been too closely allied with the interests of "privileged big business." His campaign speeches, characterised by a striking phraseology, won much applause, but were remarkable for their high moral tone rather than for originality of thought or policy. Like Roosevelt he demanded a national renaissance of ideals. In matters of immediate concern, such as the tariff, trust regulation, currency, the interests of labour, he insisted that the "rule of justice and right" must be set up. As regarded the future, in matters of conservation and trade, he asserted that great opportunities had been lost through the interlacing of privilege and private advantage with the framework of existing laws: "we must effect a great readjustment and get the forces of the whole people once more into play." His radicalism was of a mild sort, and he insisted that "we need no revolution, we need no excited change; we need only a new point of view and a new method and spirit of counsel." The popular temper was responsive to such a tone, but success in large measure could hardly have come to him except for the division of Republican forces through the campaign of Theodore Roosevelt as Progressive candidate. In the Nov. election Mr. Wilson received 435 electoral votes as against 88 for Roosevelt and 8 for Taft; but his popular vote was 1,000,000 less than that of his two chief opponents, and in only 14 states (all in the South) did he receive a clear majority.

Despite the fact that he was the choice of a minority of the whole people, Mr. Wilson's political position when he assumed office on March 4 1913 was one of remarkable strength. He was supported by a Democratic majority in both Houses of Congress, the Republicans were at loggerheads and he might expect support from the Progressives for much of his reforming legislative programme. His Cabinet was not distinguished, but it contained certain elements of political and administrative strength, which proved advantageous for the moment, although later it was to become the mark for bitter criticism. The President soon made it plain that he was determined, as in his governorship of New Jersey, to exercise his personal influence and his position as head of the party to initiate and carry through the legislation he had advocated in his campaign. His ascendancy in Congress was soon established. After convoking both Houses in special session on April 7 1913 he delivered his first message in person, reviving the custom that had lapsed since the administration (1797) of the elder Adams. He intervened constantly during this and later sessions, to further the legislation in which he was especially interested.

The first important piece of legislation that resulted from the special session was the Underwood Tariff Act, which was passed in Sept. and signed by the President Oct. 3 1913. It provided for a notable downward revision, and naturally met strong opposition from varied industrial interests. Such opposition was overcome largely through the personal efforts of Mr. Wilson, who appealed constantly to public sentiment, notably in an attack upon the activities of hostile lobbyists. The Tariff Act, in addition to lower duties and important administrative changes, introduced an income tax—long advocated by Democrats—which was destined in later developments to counterbalance the loss of revenue resulting from the lowering of the tariff; it weighed heavily upon the industrial interests of the North and increased the growing unpopularity of the President in that region. The Tariff Act was followed by a broad measure of currency reform, the Federal Reserve Act, signed Dec. 23 1913; it is generally regarded as the administration's second great legislative triumph. Mr. Wilson's purpose was to supplant the dictatorship of private banking institutions by a reorganisation that should provide funds available to meet extraordinary demands and a currency that would expand and contract automatically. Early in 1914 the President called upon Congress to continue its labours of reform by the regulation of the trusts. After long debate and warm opposition, his appeal was answered by the passing of the Federal Trade Commission Act and the Clayton Anti-trust Act. The latter, besides perfecting anti-trust legislation in several ways, met the demands of labour by declaring that labour was not a commodity, by prohibiting injunctions in labour disputes

unless necessary to prevent irreparable injury, and by proclaiming that strikes and boycotts were not violations of Federal law. It further exempted labour associations from the anti-trust laws.

Mr. Wilson's policy of domestic social reform had thus been developed with surprising legislative success during the first year of his administration. His foreign policy was not so clear-cut and aroused little enthusiasm. It was characterised by an evident desire to concede the rights of other nations to the limit and to avoid any stressing of the power of the United States for the material advantage of its citizens. Definite steps were taken to prepare the Filipinos for self-government. Pressure was brought to bear upon the California state Govt. to mitigate the severity of its anti-Japanese legislation. The "dollar diplomacy" of the preceding administration was repudiated and American bankers effectively discouraged from participating in the international Chinese loans. As a result of the President's personal demand, Congress repealed the law exempting American coastwise shipping from Panama Canal tolls. Mr. Wilson, however, failed to secure the Senate's ratification of a treaty with Colombia, which contained a virtual apology on the part of the United States and an offer to pay \$25,000,000 as reparation for the alleged grievances of Colombia in connection with the establishment of Panama as an independent country. In the Caribbean, Mr. Wilson's policy differed in principle rather than practice from that of his predecessors; in Nicaragua and Haiti the customs were taken over by U.S. officials. By a treaty signed Sept. 16 1915, a virtual protectorate of Haiti was assumed; in Santo Domingo the precautionary visits of American cruisers were followed in the summer of 1916 by the landing of marines, and in Nov. of that year by the proclamation of a military government under American auspices.

Mr. Wilson's Mexican policy aroused heated criticism. Following the accession of Gen. Huerta to power and the President's failure to arrange a settlement providing for his elimination as dictator, Mr. Wilson resigned himself to what he called a policy of "watchful waiting." Conditions in Mexico were anarchical, and intervention was strongly urged by both American and European commercial interests. To formal intervention the President was definitely opposed, but in April 1914 he was compelled to authorise the occupation of Vera Cruz in retaliation for affronts to American bluejackets. The proffered mediation of Argentina, Brazil and Chile he gladly accepted, but the resulting protocol of Niagara Falls (June 24 1914) did not provide a basis for peace. Although Huerta fled from Mexico in July, the country continued to be torn by rival factions. American troops were withdrawn from Vera Cruz in Nov. 1914, but it was not until Oct. 1915 that the Government of Carranza was recognised by Mr. Wilson, in company with eight South and Central American Governments. Further complications ensued. The raid into American territory of Gen. Villa, March 9 1916, led Mr. Wilson to authorise a punitive expedition, which soon aroused the protests of Carranza. In May and June the President mobilised the National Guard and sent a force of about 100,000 to patrol the Mexican border. The crisis was tidied over by a joint Mexican-American commission sitting at New London, Conn., which brought no definite settlement, but at least postponed hasty action on either side. In Jan. 1917 the last American troops were withdrawn from Mexican soil. The President's policy had not led to stable conditions in Mexico, and the sole advantage secured seemed to be the emphasis laid by the U.S. Govt. on the principle that it would not take advantage of the misfortunes of a weak neighbour for its own selfish profit.

Foreign affairs after July 1914 were naturally dominated by the World War. President Wilson insisted upon a policy of strict neutrality. This he emphasised not merely by formal proclamation on Aug. 4, but by an address to the American people on Aug. 18, in which he adjured them, in view of the mixture of nationalities in the United States, to be impartial in thought as well as action. His offer of mediation, made on Aug. 5, remained without response, and further attempts at mediation in early autumn proved fruitless. His determination

to remain absolutely aloof from European quarrels was underlined in several addresses, in which he insisted that the United States was in no way concerned, and was further emphasised by his opposition to any change in its military policy. America's vital interest in the struggle, however, soon became plain and resulted in diplomatic controversies with the belligerents. Great Britain's attempt to control indirect importation of goods into Germany, by an enlargement of contraband schedules and an extension of the doctrine of "continuous voyage" to conditional contraband, was vigorously opposed by President Wilson, who authorised Mr. Bryan, his Secretary of State, to protest in strong terms. A lengthy interchange of notes followed, which led to no settlement.

The diplomatic controversy with Germany proved more serious. The proclamation of a "war zone" about the British Isles, in which German submarines threatened to destroy enemy merchant vessels with consequent danger to the lives and property of neutrals, was met by a note of Feb. 10 1915, which warned Germany that she would be held to "strict accountability" for the lawless acts of submarine commanders. Mr. Wilson further attempted to find a compromise, based upon a relaxation of the British food blockade and an abandonment of the German submarine campaign. The effort failed and was followed by a series of submarine attacks, which culminated in the sinking of the "Lusitania," May 7 1915, with the loss of over 100 American lives. The President, while he disappointed opinion in the eastern states by a speech in which he reaffirmed his pacific determination, stating that a man might be "too proud to fight," at once set out to win from Germany a disavowal and a promise that merchant ships should not be torpedoed without warning and the saving of the lives of passengers.

A lengthy exchange of notes ensued; the pacific Mr. Bryan, Secretary of State, regarding the President's language as too strong, resigned; on the other hand Mr. Wilson's patience with the evasions of the German Govt. and the continued sinking by submarines led to bitter attacks upon the President's policy of conciliation, which was stigmatised as anaemic or even cowardly. Mr. Wilson succeeded, however, in securing from Germany a promise not to sink liners without warning (Sept. 1 1915), and continued his efforts to induce Germany to abandon the submarine campaign completely. He was hampered by an attempted revolt of Congressional leaders, who blurred the issue with Germany by introducing resolutions designed to prevent Americans from travelling upon belligerent ships. The President, through his personal influence, secured the defeat of these resolutions in Feb. 1916, insisting that he would not consent "to any abridgment of the rights of American citizens in any respect." Shortly afterwards the issue with Germany was brought to a head by the sinking of the "Sussex," March 24 1916. Mr. Wilson waited three weeks before sending a formal note of protest to Germany (April 19 1916), but couched it in the form of an ultimatum, stating that unless Germany should immediately declare and effect an abandonment of its present methods of submarine warfare, the United States would be compelled to sever diplomatic relations. The German answer, while attempting to make acceptance conditional upon Great Britain's relaxation of the blockade, was in effect a promise not to sink merchant ships without warning and without saving human lives. The submarine issue now seemed less critical.

The diplomatic victory thus apparently secured by Mr. Wilson was utilised in his behalf during the electoral campaign of 1916, in which he was inevitably the Democratic candidate. It enabled his supporters to declare that he had vindicated the rights of the United States successfully, and at the same time had "kept us out of war." The slogan made a strong appeal, especially in the districts of the Middle West. The Republicans, on the other hand, who had nominated Charles E. Hughes, criticised the whole foreign policy of the President. They insisted that he had failed to take prompt action for the protection of American lives and honour, alike in his dealings with Germany and in his handling of the Mexican crisis. They characterised his domestic policy as demagogic, instancing the Clayton Act

and the Adamson Act; the latter had been urged on Congress by Mr. Wilson to avert a railroad strike in Sept. 1916, and many citizens regarded it as an untimely surrender to labour threats. They also criticised his attitude on "preparedness," to which the President had been opposed until the close of 1915, and ridiculed the cautious expansion of military forces provided for in the National Defence Act of 1916. In the east and in most industrial centres of the middle west Mr. Wilson was unpopular, but the election showed his strength in the farming districts west of the Mississippi and on the Pacific coast; in spite of Mr. Roosevelt's return to the Republican fold the President drew largely from the Progressives, and on election day received a slight electoral majority over Mr. Hughes (277 to 254) and a popular plurality of 9,129,606 to 8,538,221.

His re-election enabled Mr. Wilson to proceed with plans for peace proposals to the European belligerents. These he had been preparing since the early summer of 1916, and, regardless of the German peace balloon of Dec. 12 1916, he sent on Dec. 18 identical notes to the belligerents, asking them to state the terms upon which they would consider peace. Informed of the undercurrents of German military circles, he evidently feared that if the War continued the United States would necessarily become involved; he also hoped that a clear definition of war aims would strengthen pacific elements in both belligerent camps. The German reply was evasive; that of the Allies refused to consider peace until Germany should offer "complete restitution, full reparation and effectual guarantees." The replies gave the President opportunity to expound what he had come to believe was the only sure basis of an enduring peace. This he did in a speech of Jan. 22 1917, in which he insisted that the peace must be organised by the major force of mankind, thus emphasising the need of a League of Nations; that no nation should extend its policy over another nation; that no one Power should dominate the land or the sea. There must be a limitation of armaments. As a guarantee of future peace and justice, the ending of the existing war must not be the violation of the rights of one side or the other: it must be "a peace without victory."

Further efforts to secure a peaceful arrangement were frustrated by the determination of the German militarist clique to renew the submarine warfare, regardless of the effect on the United States. On Jan. 31, the German ambassador, Von Bernstorff, delivered a note to this effect, and four days later the President handed him his papers. He still, however, avoided formal war with Germany, and on Feb. 26 asked for a resolution of armed neutrality, which would permit the arming of American merchant ships for entrance into the barred sea zone. The resolution was blocked by a filibuster. Finally, in view of continued sinking of American ships, the President came to Congress on April 2 1917 and asked for a declaration that a state of warfare existed with Germany. The resolution was passed by the Senate on April 4, by the House on April 6.

President Wilson had always abhorred the exercise of force in international relations, and the war which he at last regarded as necessary was, in his mind, a war to ensure peace. Nevertheless he was determined that it should be waged efficiently and that the mistakes of previous wars should not be repeated. Those mistakes, he believed, had resulted chiefly from the intermixture of politics in military affairs, and from the decentralisation of the American military machine. He opposed a coalition war cabinet, as leading to divided responsibility. Military policy was handed over to the military experts. He approved the immediate development of the general staff as the centralising military organ, and it was upon the recommendation of that body that he urged, against the wish of Congressional leaders, the Selective Service Act. On the advice of the general staff he appointed Gen. John J. Pershing commander of the expeditionary force to France, and, also following that advice, he refused to authorise a volunteer force under Mr. Roosevelt. Similarly the plans for the development of a large army in France were inaugurated and translated into fact by the military experts.

As regards conduct of operations the President gave to Gen. Pershing complete authority, and permitted no interference by

politicians. In the building of the new army the President took no direct part, but he used his authority consistently to favour centralisation under the general staff. He followed a similar policy in the mobilisation of the industrial resources of the nation. He encouraged the centralising efforts of the Council of National Defence and its committees, and sought always to secure for them executive rather than the merely advisory powers which they at first possessed. He urged the Lever Act, which in Aug. 1917 created a Food and a Fuel Administration, and advocated the taking over of the railroads by the Government in December. His policy of economic centralisation was ultimately assisted by the many protests against his war policies which were made in the winter, and which centred round the demand for a non-partisan war cabinet or ministry of munitions; for his supporters were able to insist that the more effective handling of war problems demanded not new machinery but greater efficiency of the existing mechanism. The President asked for powers to cut through red tape and rearrange bureaux without reference to Congress. His demands were embodied in the Overman Act, which was passed in May 1918, and which enabled him to grant executive powers to the various boards that had been created. The War Industries Board, released from its dependence upon the Council of National Defence, at once became the centralising organ of the economic activities of the country. In his war appointments Mr. Wilson disregarded party lines, a notable fact since in political appointments he always showed himself strictly a party man. Republicans, such as Hoover, Stettinius, Goethals, Schwab, Vanderlip, were chosen because of their administrative qualities and regardless of political affiliations.

During the War President Wilson consistently developed his ideals of a new international system which should perpetuate peace and assure justice and security to every nation regardless of its material strength. He hoped thus not merely to construct a basis for just peace when the War should end, but to hasten the end of the War by appealing to the peoples of the enemy states against their Governments. The most notable of his speeches was that of Jan. 8 1918, in which he stated 14 points necessary to a just and lasting peace. This, with his later addresses, was ultimately accepted as the basis of the final settlement. Their effect in Germany and Austria-Hungary was not apparent until the military defeat of those empires, but his words acted continually as a corroding factor, weakening the enemy's determination to fight. When in the autumn of 1918 they faced military defeat, they turned to Mr. Wilson, offering to accept his Fourteen Points as the basis of peace.

The President's insistence upon justice as essential to a settlement brought him great prestige in Allied countries, but the chiefs of the Allied Govts. hesitated to accept the Fourteen Points in the fear that the advantages of the victory might be thrown away. They yielded, however, to the persuasive diplomacy of Col. House, who represented the President at Paris, and it was on the understanding that the Fourteen Points (reservation made of "Freedom of the Seas" and inclusion of Germany's promise to make full reparation) should be the basis of the peace that the Armistice was granted to Germany.<sup>1</sup> The President realised, however, that it would be difficult to translate his principles into the actual treaty. Aside from the opposition he might expect from selfish nationalistic interests among the Allies, he lacked unified support at home, where his political opponents called for a "strong peace" that would annihilate Germany; there was little enthusiasm for a League of Nations, which the President regarded as essential to a just and lasting settlement. Furthermore he had weakened his political position at home by a series of tactical mistakes. Of these, the most important was an appeal issued immediately before the Congressional election of Nov. 1918, in which Mr. Wilson asked the voters to cast their ballots for Democratic candidates, on the ground that a Republican Congress would divide the leadership at the moment of international crisis. Such an appeal would

<sup>1</sup>The Fourteen Points are set forth in full in an article on that subject.

have been comprehensible if it had been made by a prime minister in a parliamentary country, but Wilson had proclaimed himself the leader of the nation and could not logically also play the rôle of party leader. The Republicans seemed to have some ground for complaining that although they had submerged partisan quarrels during the War, President Wilson was now attempting to capitalise the War and foreign affairs in order to win a partisan advantage. Many voters were antagonised by the appeal, and the elections went in favour of the Republicans. The President thus lost command of the Senate in the next Congress and its Foreign Relations Committee was to be controlled by his political and personal opponents.

Believing that his presence at the Peace Conference was necessary, if it was not to be dominated by old-style diplomatic practices, Mr. Wilson decided himself to go to Paris, and on Dec. 4 1918 sailed with the other members of the American Commission on the "George Washington." He arrived at Brest on Dec. 13, and was received at Paris, in England and at Rome with tremendous enthusiasm. For the moment he was the popular hero, both in Allied and enemy countries. But his prestige rested on a precarious footing, and must inevitably diminish when he came to oppose the national aspirations of any people. He was anxious, therefore, to strike off a quick general peace, leaving details for later settlement; but this proved impossible, and formal conversations at Paris began only in Jan. 1919. The President succeeded in winning an early victory when he persuaded the conference to accept the principle of the League of Nations as the basis of the peace, and when, on Feb. 14, he won unanimous approval of the preliminary draft of the covenant. On returning to the United States, however, he found Republican opposition to the league strongly manifested in the Senate, although he had the support of Mr. Taft's influence in that party and in the country. Public opinion seemed to be uninstructed and apathetic as to the President's policies. Going back to Paris in March, he was able to secure the insertion in the covenant of certain amendments required by American sentiment, and the approval by the conference of the final draft of the covenant.

But he was confronted by the demands of the French, Italians and Japanese for territorial and economic concessions from the enemy, which he regarded as excessive. Long discussions followed, culminating in Mr. Wilson's acceptance of a portion of the Allied demands, notably the granting of Shantung to the Japanese, of much of the frontier line promised by the Treaty of London to Italy, and the exaction from Germany of what amounted to a blank cheque in the matter of reparations. Such concessions aroused the opposition of liberals in England and America, who insisted that the President had surrendered his principles. Mr. Wilson, on the other hand, acknowledging that certain aspects of the settlement were not ideal, believed that he had won his main contention in securing the League of Nations, which provided the mechanism for eradicating the vices contained in the treaties. In this belief he was supported by another liberal protagonist, Gen. Smuts. On June 29 1919, the day following the signing of the Versailles Treaty, the President sailed for America. His international prestige had suffered from his opposition to national claims, especially that of the Italians to Fiume and of the French to the left bank of the Rhine. Nevertheless, as the bitterness of the moment passed, the magnitude of his accomplishments at Paris became more generally recognised. When the veil of secrecy surrounding the negotiations was gradually lifted, it was seen that the belief that he had been outmanoeuvred by Lloyd George and Clemenceau was hardly justified by the facts. Lacking the negotiating ability of Lloyd George and the political experience of Clemenceau, he refused to enter the diplomatic lists with them, but by his manifest candour and sincerity early disarmed his opponents in argument. He said exactly what was in his mind, and was careful that his statements should be fortified by the documents and statistics furnished by his expert advisers.

The strain of the conference had told upon Mr. Wilson's physical and nervous strength. He was thus not well equipped to wage the struggle with his Republican opponents in the Senate

which developed upon his presentation of the treaty. Had the President been willing to compromise and accept reservations to the covenant of the league, it is possible that the two-thirds necessary to ratification might have been secured. This course he refused to follow, and it soon became clear that the Foreign Relations Committee would not recommend ratification without serious reservations or amendments. In the hope of winning popular support, the President set forth upon a tour of the country, and along the Pacific coast aroused enthusiasm in marked contrast to the coldness of the East. The effort, however, overtaxed his strength, and on Sept. 26 at Wichita, Kan., the President was compelled to give over his tour and return to Washington, where he suffered a complete nervous collapse. The exact nature of his illness was not made public and few realised how serious it would prove to be. Many, however, felt that in view of his inevitable abstention from active work it would have been wiser for him to retire at least temporarily. As it was, his system had provided for no understudy and the administration was left without a leader.

Entirely apart from the confusion thus caused in the conduct of public business, Mr. Wilson's illness led directly to the defeat of the treaty. There was no one else capable either of leading the fight for ratification without reservations, or with sufficient authority to arrange a compromise. On Nov. 13 the Senate adopted reservations which Mr. Wilson declared would "nullify" (etc., etc.) the treaty; for this reason he urged the Democrats to refuse to vote for the ratifying resolution, which was accordingly defeated on Nov. 19 1919. During the succeeding weeks efforts were made to arrange a compromise. The Republican leaders agreed to soften the language of certain reservations, and the President intimated that he would accept a mild reservation on Article X. of the covenant, which had aroused the chief opposition. Neither side would yield enough, and when on March 19 1920, the final vote was taken on the ratifying resolution, which contained a strong reservation on Article X., Mr. Wilson again urged Democratic senators not to accept. The resolution thus failed of the necessary two-thirds by a margin of six votes, 57-37. The President appealed to the autumn presidential election in 1920 as the decisive plebiscite. Although he had lost his former control of the party, and the Democratic presidential nominee at San Francisco was not his choice, the Wilsonian policies, including approval of the League of Nations, were inevitably the issue of the elections. In the electioneering campaign, however, the President himself could take no active part, for his physical collapse proved so serious as to confine him to the White House. For the overwhelming victory won by the Republicans, see *UNITED STATES (History)*. After his defeat Mr. Wilson kept close silence on public matters, and his annual message of Dec. 1920, while it sounded the note of national duty, made no reference to that which lay nearest his heart—the League of Nations. This silence, indeed, he preserved until the close of his administration, March 4 1921. In Dec. 1920 he had been awarded the Nobel Peace prize.

After his retirement from office Mr. Wilson lived quietly in Washington, refraining from all political comment. He appeared to greet his admirers on Armistice Day, 1923, with a short speech from the porch of his house. For months he had been growing weaker, and on Feb. 3 1924 he died in his sleep.

The failure of President Wilson to win the approval of the United States for his peace policies presents one of the most interesting problems of American history. He had led the country through the difficult period of a war unsurpassed in magnitude and culminating in complete victory; in the face of serious obstacles he had forced European statesmen to accept the major item in his programme; he returned home only to be repudiated by his own people. Personal and partisan factors unquestionably contributed to his defeat. In private intercourse Mr. Wilson displayed a personal magnetism, a breadth of culture and a genial cordiality that are amply attested by his intimates. But in public life he proved unable to capitalise such advantages, possibly because of natural shyness, possibly because physical delicacy restricted his social activities. Roose-

velt's capacity for "mixing" with all political and human types he totally lacked. In the formation of his policies he isolated himself and was unable to establish close relations with Congressional leaders. This gave rise to the impression that the President disliked advice, was an egocentric autocrat and immediately dispensed with anyone who disagreed with him. Such criticism, by no means a novelty in the case of strong-willed presidents, was utilised by his political opponents and intensified his unpopularity in the industrial centres, especially of the east, an unpopularity which, except for a brief period during the opening months of the War, was an outstanding factor in the political situation. Broadly speaking, the criticism does not seem to be fully justified. In matters of what he regarded as principle he was adamant, and he distrusted the judgment of those whose basic point of view was different from his own; but the evidence of those who worked with him, including that of Republican advisers at Paris, is almost unanimous to the effect that he was anxious to secure advice, was tolerant of opinions, and glad to delegate responsibility. The contrary belief was doubtless fostered by Mr. Wilson's inability to build up an efficient secretarial organisation, and his incapacity, rather than unwillingness, to apportion effectively the details of administrative labour. His handling of war problems shows clearly his desire to delegate responsibility; once an appointment was made he refused to interfere and consistently protected his appointee from the importunities of politicians.

Political responsibility in general, he believed, should rest with the President. From conviction, rather than from egotism, he sought to emancipate the presidential office from the control of Congressional committees, a control which he earnestly deplored in his earliest writings. The President, he felt, should be the real leader of the nation, and not a mere executive superintendent. The Cabinet he looked on as an executive and not as a political council, and it was always strictly subordinated to his policies. So long as the Democrats held the majority in Congress he was able to translate such ideas into fact, and effectively disposed of all attempted Congressional revolts. This attitude naturally did not allay the political resentments which were inevitably aroused and which were intensified by Mr. Wilson's tendency to regard political opposition as tantamount to personal hostility; when the Democratic majority disappeared he faced uncompromising hostility. He was intensely impatient of partisan obstruction of his idealistic plans, and there is much of the Calvinist in his refusal to temporise or deviate from the path which he believed himself appointed to tread. While in matters of detail he showed at times some capacity for compromise, in matters of principle he displayed the unswerving determination characteristic of the prophet, a trait that is not always conducive to success in the exigencies of modern party warfare. Indeed it is as a prophet rather than as a statesman that Mr. Wilson should be regarded. No one has preached more effectively the necessity of introducing a moral standard into international politics.

The following are the most important writings of President Wilson: *Congressional Government, a Study in American Politics* (1885); *The State—Elements of Historical and Practical Politics* (1889); *Division and Reunion, 1820-89* (1893); *An Old Master and Other Political Essays* (1893); *Mere Literature and Other Essays* (1893); *George Washington* (1897); *A History of the American People* (1902); *Constitutional Government in the United States* (1908); *The New Freedom* (1913); *On Being Human* (1916); *International Ideals* (1919). Personal and political biographies of President Wilson have been written by H. J. Ford, *Woodrow Wilson: The Man and His Work* (1916); by H. W. Harris, *President Wilson: His Problems and His Policy* (1918); by W. E. Dodd, *Woodrow Wilson and His Work* (1920); and by his private secretary, Joseph P. Tumulty, *Woodrow Wilson as I Know Him* (1922). All four are eulogistic, especially the two last named. Critically appreciative biographies are: David Lawrence, *The True Story of Woodrow Wilson* (1924), and William Allen White, *Woodrow Wilson, the Man, his Times, and his Task* (1924). A less friendly interpretation, valuable for Wilson's Princeton career, is Robert E. Annin, *Woodrow Wilson: a Character Study* (1924). The chief authority for Wilson's work at the Peace Conference is Ray S. Baker, *Woodrow Wilson and World Settlement* (1923). A documented exposition of Wilson's character and policies is found in *The Intimate Papers of Colonel House*, arranged as a

narrative by Charles Seymour (1926). General surveys of Wilson's foreign policy are to be found in E. E. Robinson and V. J. West's *The Foreign Policy of President Wilson, 1913-7* (1918), and in Charles Seymour's *Woodrow Wilson and the World War* (1920). In *Beacon Lights of History*, 1924, P. W. Wilson gives a close analysis of Wilson's character and career. The authorised edition of President Wilson's state papers and addresses is *The Public Papers of Woodrow Wilson*, edited by Ray S. Baker and William E. Dodd (1925). (C. SEY.)

**WINCHESTER**, England (see 28.704), had a population of 23,791 in 1921 and an area of 1,930 acres. The city has been included in the parliamentary division of the same name since 1918. A scheme for the division of the large diocese received the royal assent in 1924. Alarming cracks and subsidences having been discovered in the walls and vaulting of the transepts and east end of the cathedral, the work of underpinning the foundations almost throughout, of grouting and bonding the walls and of reconstructing much of the vaulting, was begun in 1906 and finished in 1912, at an expenditure of about £110,000. A recumbent bronze figure of Sir Redvers Buller was placed in the north transept in 1911. The Hampshire, Isle of Wight and city of Winchester War memorial cross was unveiled outside the main west door in 1921; a memorial statue to men of the King's Royal Rifle Corps in the churchyard in 1922; and the Winchester College war memorial, a beautiful cloister in connection with the Boer War memorial gate, in 1924. A site of 100 ac. in the St. Cross district has been developed as a garden city. New county council offices on Castle Hill were opened in 1911. A chamber of commerce was founded in 1919.

**WINDMILL:** see AIRSCREW.

**WIND POWER** (see 28.710).—The development of the windmill for electricity generation is mainly—certainly, at any rate, so far as Great Britain is concerned—a post-War movement. Earlier attempts were mostly crude and unsatisfactory, and the old sweep-sail mill may be said to have vanished completely, at least in this connection. Structures built on gaunt masts or skeleton-like framework towers lack the picturesque attractiveness of the old types, but possess efficiency and compactness.

The windmill was adapted to this new purpose in the hope that the initial outlay (higher perhaps than when supply is by internal combustion engines) would be more than compensated by low running costs and the need of rare personal attention. The only factor preventing widespread use is the fear of discontinuity of supply in calm periods, with its consequent recourse to temporary assistance. Adequate storage will meet this objection.

**Experiments.**—The windmills used for test experiments conducted by the Institute of Agricultural Engineering, University of Oxford, were of different heights ranging from 10 ft. to 60 ft. from the ground, and the various wind wheels varied from 8 ft. diameter to 29.5 ft. diameter and were fitted with generators rated at from 0.300 kw. to 10.0 kilowatts. The rating is usually given as the maximum output at wind speeds varying from 18 to 25 m.p.h. according to the design, the smallest size mentioned being sufficient to furnish light to a cottage or small house, while the larger sizes are capable of meeting power demands.

**Wind Wheels.**—The types of wind wheels in use were of three patterns:—

- (a) Multi-bladed, with concave sheet-metal blades.
- (b) Five-bladed, with semi-streamlined metal blades.
- (c) Four-bladed, with fabric-covered streamlined blades.

In the last case the wheels were mounted behind the headpiece and automatically kept their position in the wind stream. The other wheels were mounted in front of their respective structures, and required a tail vane or other auxiliary apparatus to maintain the windwheel in the proper direction. Each wind wheel was governed in such a way that on the wind speed reaching a pre-determined value the speed of the wheel was controlled to keep the output of the generator from exceeding the safe limit.

In windmill work the "fuel" used is free and unlimited and there arises the possibility of a large "inefficient" wheel being preferable to a smaller "efficient" one, which is more expensive to manufacture. This is a point of difficulty at the stage of

development of purely stream-lined blades. A windmill plant with an approximate aggregate output of 3,650 units shows charges bringing the unit cost to 4d. only, reckoning on available energy apart from battery losses.

**Calms and Storage.**—As to the question of calms and the planning of adequate storage to tide over the worst period which may be expected from all the figures and records of wind conditions, etc., it may be concluded that, if sufficient storage is provided to cope with the heavy winter load for three days, there is little likelihood of the supply ever being seriously interfered with. If the load is flexible and can be reduced during the critical period, the assurance of continuity of supply is complete.

**Selection of Sites.**—Observation of wind conditions over several years show that when fixing the site for a windmill plant the greatest care should be taken to ensure freedom from interference from trees, etc., on the sides from which the winds mainly come. The wheel should be as high as possible in order to obtain the utmost use of the winds. At the coast and in exposed hilly districts there should be no hesitation in adopting wind power to supply electricity. Even in ordinary inland parts there are very few districts where a suitable site cannot be found. Thus, for isolated districts wind power may be adopted for generating purposes with every assurance of reliability and economy; and even for communal groupings and for medium power work there are larger sets which will provide the same service.

**BIBLIOGRAPHY.**—P. la Cour's reports *Försögsmöllen*, vol. 1 (1900), vol. 2 (1903), translated into German by J. Kauffmann; *Die Windkraft und ihre Anwendung* (Leipzig 1905); O. Stertz, *Moderne Windturbinen* (Leipzig 1912); L. Hammel, *Die Ausnutzung der Windkräfte* (1925). **WINE** (see 28.716).—The production of wine has not undergone any drastic changes. Since the World War, small motor ploughs have appeared in the vineyards, better machinery has been devised for removing the stalks (a valuable part of the crop), fertilisers and germicides have been improved, and the *chais* and cellars have become more cleanly and orderly under the influence of modern hygiene and factory methods. But the vigneron, while diligently using saccharometers, hydrometers, etc., still trusts primarily in his eye and nose and palate. Chemists and engineers, however, have not slackened in their attempts to find rapid methods of "ageing" wines.

For example, Prof. Charles Henry, of the Sorbonne, claims that he can both "age" young wines and purge them of defects by placing the cask in an electro-static field of 60,000 to 120,000 volts. Other inventors have applied themselves to the familiar problem of maturing and clarifying large quantities of sparkling wine in strengthened vats, wherein the juice is first raised in temperature and then chilled for five or six days. As this process is much quicker and cheaper than the traditional method of mellowing the wine in bottles for years, and then shaking down and disgorging the sediment from one bottle at a time, it is said to be a commercial success in the making of *vins mousseux* for the less fastidious markets; but no champagne house with a reputation to lose has looked with favour upon such mass production.

**The Effects of the War.**—World politics and economics rather than novelties of viticulture and vinification explain the great changes in the position and prospects of wine. So highly did the French military authorities rate wine as a food and medicine during the War that a full litre became part of every *poilu's* daily ration. By 1918 the daily issue of wine to the French armies amounted to 27,000 hectolitres, or about 3,500,000 ordinary wine-bottles. Beer-drinkers of Picardy and cider-drinkers of Normandy were thus turned into amateurs of wine. At the same time, wine consumption increased in Great Britain, largely because of demands from soldiers who had acquired the taste in France and, as wine imports were severely restricted, the carefully graded stocks of the wine merchants were eagerly bought and consumed long before they could mature. This keen demand absorbed even the *mauvais vins authentiques* (genuine wines from famous vineyards, but of poor vintages) which had been hanging

on the Bordeaux market for decades. In Germany, also, most of the hoarded wines were consumed. Hence, throughout Western Europe, the shrewdly chosen bins by which prescient merchants had hoped to maintain the succession of old-bottled wines were scattered, mostly among indiscriminating purchasers. After the War, the financial needs of War-strained States demanded heavy increases in wine taxes. As such imports are payable in advance, any post-War wine merchant who tried to reconstitute the stately old sequences of wine by accumulating successions of bottlings on the pre-War scale, was faced by the need for a vastly increased cash capital, most of which would have to lie locked up in duty-paid cellars for many years. In most cases this was impracticable, and therefore the public is reconciling itself to wines (especially ports from the wood and French white wines) with little or no bottle-age.

*Changes in Consumption.*—The lowering of wine standards thus imposed on gastronomy by politics and economics has been intensified by social and ethical revolutions both in the Old World and in the New. Russia's aristocratic patronage of fine wines has ceased. American prohibition further discourages superlative viticulture, because the wine imports of the United States (where more than 50,000,000 gal. of Californian and other national wines used to be annually produced), were mainly *vins de luxe*. British consumption, however, has increased. In 1924, Great Britain and Northern Ireland consumed 15,334,346 gal. as against only 11,367,549 gal. taken by the whole of the United Kingdom in 1913; but even with this increase the annual enjoyment of wine in Great Britain is at the rate of less than three bottles a head, mostly port.

*Treaty Provisions.*—The Treaty of Versailles explicitly engaged Germany to obey the Conventions of Washington (1913) and Madrid (1891), protecting "regional appellations" of wines. In France, from 1908 onwards, many decrees have delimited famous districts, such as Sauternes; but these decrees are inoperative outside France and one still hears of Spanish burgundy, Algerian chablis and even Rumanian champagne. A notable advance, however, was made by the Anglo-Portuguese Commercial Treaty Acts of 1914 and 1916, whereby true port and madeira are guarded by British law against false descriptions. But delimitation has its drawbacks. It gives prestige and market value to the bad as well as the good wines of a delimited area, and thousands of pipes of low-strength, doctored *consumo* (rough table-wine) are shipped from Oporto every year under the protection of the treaty. But diplomacy and commerce are co-operating to rid the sound principle of delimitation of this defect. The warmly discussed action of Spain (1924) in requiring Iceland either to relax her prohibition of Spanish wines or to lose the Spanish market for her fish at least had the advantage of emphasising wine's international importance.

*British Empire Wines.*—As Empire wines enjoy a substantial preference in Great Britain, "regional appellations" are of enhanced urgency for the vinedressers of Australasia and the Cape. The sweet Australian dessert wine which is becoming popular with Britons cannot be called Australian port because of the Anglo-Portuguese Treaty above mentioned; but the Commonwealth is still far from "the complete abandonment of European geographical wine names," for which the Australian, Professor Wilkinson, and many others have pleaded. The Wembley Exhibition gave a stimulus to Empire wines, for which there is a bright future provided they cease to put themselves in suicidal rivalry with the historic wines of France, Germany, Portugal and Spain. After a disaster in 1920, through over-production, Cape wines are prospering under a fostering Act passed by General Smuts' Government. A sum of £100,000 was devoted to a South African experiment of maturing. Australian exports are also increasing at a fairly rapid rate (see AUSTRALIA; FRANCE; SPAIN; etc.). (E. J. O.)

**WINGATE, SIR FRANCIS REGINALD** (1861– ), British administrator (see 28.729). In Dec. 1916 he was appointed high commissioner for Egypt and relinquished the governorship of the Anglo-Egyptian-Sudan, after a successful administration during 16 years. At the beginning of 1919 Sir Reginald Wingate was

summoned to London to report on the situation which had arisen in Egypt, and he remained there many months at the disposal of the Government until his resignation on Oct. 1919. He had received the G.B.E. in Jan. 1918, and was created a baronet in June 1920.

**WINNINGTON-INGRAM, ARTHUR FOLEY** (1858– ), Anglican divine, was born in Worcestershire Jan. 26 1858. Educated at Marlborough and at Keble College, Oxford, in 1884 he was ordained and became a curate at St. Mary's, Shrewsbury. In 1885 he became private chaplain to the Bishop of Lichfield, and in 1889 head of Oxford House, Bethnal Green, London. In 1895 he was appointed rector of Bethnal Green and in the following year rural dean of Spitalfields. In 1897 he left Bethnal Green to become Bishop of Stepney and canon of St. Paul's Cathedral. In 1901 he succeeded Dr. Mandell Creighton as Bishop of London, becoming at the same time dean of the Chapels Royal. Dr. Winnington-Ingram achieved great popularity, not only within the confines of his diocese, by the ready sympathy he displayed to all who appealed to him for help and by the tireless energy with which he championed social causes.

Among his published works are *Banners of the Christian Faith* (1899); *The Church in Time of War* (1915); *The Potter and the Clay* (1917); *Rays of Dawn* (1918); *Victory and After* (1919); *The Spirit of Peace* (1921); *Rebuilding the Walls* (1922).

**WINNIPEG**, (see 28.731), the capital of the Canadian province of Manitoba, the third city of the Dominion, the great commercial and wholesale distributing centre for the Middle West, and the largest grain market in the world, had a population in 1921 of 179,087 (283,852 with suburbs), and an area of about 24 square miles. The importance of the city was enhanced after 1911 by the completion of the Grand Trunk Pacific Railway, which became later a part of the Canadian National Railways system.

Winnipeg is now on three trans-continental lines, and has extensive railway shops, and a fine new union station in addition to the large C. P. R. depôt. A large new legislative building has been erected. Winnipeg has also increased in importance as a manufacturing centre, and had 1,200 industrial establishments, including very large flour-mills, in 1922. Fur auctions are held on a large scale. Two extensive hydroelectric systems, both deriving power from the Winnipeg river 100 m. distant, have been installed, one of which is owned and operated by the city. A fine agricultural college with extensive grounds has been erected on the outskirts of the city. St. Boniface, on the opposite bank of the Red river to Winnipeg, is a separate municipality, with a population in 1921 of 12,816, largely French and Roman Catholic. St. Boniface is the Roman Catholic headquarters of the Western provinces, and contains a cathedral, a convent and hospital, an archiepiscopal palace and St. Boniface's College, in addition to large flour-mills and stockyards.

**WINTER, JOHN STRANGE** (1856–1911), British writer (see 28.734), died in London Dec. 13 1911.

**WINTER SPORTS.**—Since 1910 the development of winter sports has been more marked than during any previous period. Until 1913 winter sports in the Alps were a pastime of the leisured classes chiefly, but after 1919 increasingly large numbers of persons from all grades of society went to Switzerland for periods varying from one week to the whole season, and this development in no way resulted in decreased interest of the leisured classes. Norway and Sweden, also, became increasingly popular on account of good travel services and the first-class sporting facilities afforded.

*Sports in Switzerland.*—In Switzerland, the post-War development was due in a large measure to the electrification of the Swiss railway system; in 1912 a committee of experts examined the question of electrification as a means of coal economy, and in 1913 electrically propelled trains were introduced on the Engadine express route from Coire onwards. During the years 1914–8 the work was necessarily suspended, but in 1919 the engineers of the Swiss Federal and Rhaetian railways resumed operations, and at an approximate cost of 18,800,000 fr. the whole system was electrified. This opened up a good many small resorts which had been previously inaccessible. In 1910

there were approximately 45 resorts to which people went for organised winter sports, but in 1924 the number had been increased to 89, with an approximate increase of 150% in the number of passengers travelling from Great Britain to Swiss resorts direct.

With the development in the number of resorts, the various snow sports became very highly specialised. Ski-running, skating, curling, bobsleigh riding and skeleton running were all developed. Ski-running, skating, ice hockey and ski-jumping are included in the programme of the Olympic Games—though of necessity held at a time and place distinct from games not dependent on snow conditions. The Alpine Games at the eighth Olympiad were held at Chamonix in Feb. 1924, and it was arranged that those of the ninth Olympiad should be held at St. Moritz, when skeleton running was to be included in the programme. Women began to take part in all winter sports organised at the Swiss resorts, but comparatively few women ride the Cresta run. Skeleton running is generally considered a sport more suited to the physique of a man. On the Cresta run, the total number of riders of both sexes in one season rarely exceeds 30. On the other hand, bobsleighbing has become very popular; at most Swiss resorts there is a specially constructed run, the one at St. Moritz and the Schatzalp run at Davos being among the better known. In bobsleighbing, the *ventre à terre* position was revived and is now almost universal. The developments in ski-running are largely due to the test system instituted by the ski clubs of Great Britain, and the standard of running has greatly improved in consequence. Ski-jumping among English people is still practically confined to experts, but the performances of the Swiss and Scandinavians at this pastime are gradually inspiring the people of other races to participate; many English people go annually to Oslo, Norway, to witness the Holmenkollen ski-jumping championships, which, indeed, provide a thrilling and wonderful spectacle.

*The United States.*—Snow and ice sports are popular in the United States. The natural resources of the Adirondack mountains, allied to the enterprise of the American sportsman, have provided winter sports which challenge comparison with those of Switzerland. At Lake Placid, one of the largest American resorts, the season opens early in Dec., and about 1,000 people can be accommodated. The Inter-Vale Ski Jump, which is the principal sporting contest, takes place on the anniversary of Washington's birthday, Feb. 22. Ski-ing is the favourite winter sport, although skating is popular, and skaters are very well provided for. There are special rinks for curling, figure skating and ice hockey. Bobsleighbing, ski-øering and tobogganing—on the flat American type of toboggan—are all sports subsidiary to ski-ing at Lake Placid, which is becoming one of the most popular resorts for families during the Christmas holidays.

In New England several resorts are available, such as Picketts; New Hampshire and Toy Town, Winchendon, Massachusetts. Within 30 m. of New York City there are various smaller places, such as Briarcliff Lodge, catering for week-end visitors; an annual ski-jumping contest takes place here on Washington's birthday. In the winter of 1924 snow had to be imported from upper New York State to make this contest possible. In the west, skating is perhaps more popular than in New York State. Chicago, for instance, has skating contests which attract a large number of contestants and visitors. (V. M. C.)

*Canada.*—In Canada climatic conditions are more favourable to snow and ice sports than those existing in the United States. The season is longer, the temperature much lower and steadier and particularly in Ontario and the Maritime Provinces, the snowfall is greater. Snow-shoeing, tobogganing and skating have been popular winter sports for years, and in Manitoba and Eastern Canada can be enjoyed usually without a break from Nov. to March. Ice hockey enjoys a great vogue with the younger element, and contests between the leading clubs attract enormous crowds. Ski-running and jumping is of comparatively recent introduction, but is becoming increasingly popular. Curling is extensively played, interest in it being periodically stimulated by the visits of representatives of

prominent Scottish curling clubs. The centre of winter sport is Montreal with its magnificent physical surroundings, the slopes of Mt. Royal affording every opportunity of indulging in snow-shoeing, tobogganing and ski-ing under ideal conditions. The annual Winter carnival at Montreal offers a unique spectacle, though that held at Quebec is a close competitor in point of attendance. The annual curling Bonspiels held at Montreal, Toronto, Winnipeg and other centres attract competing teams from all parts of Canada and contiguous territory of the United States.

**WIRELESS TELEGRAPHY AND TELEPHONY.**—This article is arranged with three main divisions, since the three periods—(1) from 1910 to 1914, (2) the War period and (3) the post-War period—each have special features.

### I. PERIOD 1910–AUG. 1914

1. *Wireless Shipping Report.*—The first wireless shipping report was published by Lloyd's in 1910, the importance of wireless to the mercantile marine having become well recognised by this date, and shore stations for communicating with shipping were becoming general in all parts of the world.

The ship transmitters of 1910 included induction coil and small generator sets from 150 watt to two kw. plain spark, rotary spark and quench gap sets, direct or inductively coupled to the aerial and tuned to 300 metres or 600 metres.

The receiver comprised an adjustable tuned circuit and a magnetic detector, crystal detector, or a barretter, with, in many cases, an additional circuit or circuits designed specially to minimise interference, particularly from atmospherics.

2. *Post Office Stations.*—By the autumn of the same year the transfer to the British Post Office of all the wireless coast stations in the United Kingdom established by the Marconi Company for shipping communication and others belonging to Lloyd's had been completed, their technical equipment being as set out in the following table:—

| Station        | Nominal power of station | Transmitter                       |
|----------------|--------------------------|-----------------------------------|
| Caister        | 1½ Kw.                   | Rotary converter and plain spark. |
| North Foreland | 3 Kw.                    | Motor generator and plain spark.  |
| Niton          | ¼ Kw.                    | Coil and plain spark.             |
| Lizard         | ¼ Kw.                    | Coil and plain spark.             |
| Seaforth       | 3 Kw.                    | Motor generator and plain spark.  |
| Bolt Head      | 3 Kw.                    | Motor generator and plain spark.  |
| Rosslare       | ¼ Kw.                    | Coil and plain spark.             |
| Tobermory      | 1½ Kw.                   | Rotary converter and plain spark. |
| Lochboisdale   | 1½ Kw.                   | Rotary converter and plain spark. |
| Crookhaven     | 3 Kw.                    | Motor generator and rotary spark. |
| Malin Head     | ¼ Kw.                    | Coil and plain spark.             |
| Hunstanton     | ¼ Kw.                    | Motor generator and plain spark.  |
| Skegness       | ¼ Kw.                    | Motor generator and plain spark.  |
| N. Ronaldshay  | 50 watts                 | Coil and plain spark.             |
| Sanday         | 50 watts                 | Coil and plain spark.             |

3. *Naval and Other Stations.*—At this date also there were naval stations equipped with 100 kw., 250 cycle rotary spark transmitters at Hornsea, Cleethorpes and Gibraltar; and when in the following year the 14 kw. stations at Aberdeen, Ipswich, Pembroke and finally Whitehall were completed, the power to control the movements of warships in distant or foreign waters direct from the Admiralty became possible.

In 1913 with 30 shore stations and 435 ships fitted with wireless this direct control was an accomplished fact.

The Hornsea 100 kw. arc commenced working in 1912, and in 1913 the two-kw. arc transmitter became standard for naval use on board ship.

In 1912 there were 250 stations in different parts of the world engaged solely in ship-to-shore traffic, and nine high power stations were also available for this work.

4. *Thermionic Valves and Valve Circuits.*—At this period the use of the Fleming thermionic two-electrode valve as a detector was steadily growing, but the possibilities of the modifications introduced by Lee de Forest, consisting of the three-electrode valve patented in 1906, and its amplifying circuit in 1907, were

not fully realised for several years. The 1907 circuit is shown in fig. 1. A filament made incandescent by the battery  $B_1$  is indicated at F, a metal plate maintained at a positive potential by the battery  $B_2$  is shown at P, and an electron current flows from F to P.

FIG. 1.—The Lee de Forest amplifying circuit.

Between them is interposed a metallic grid G, to which is applied the high-frequency potential of the signal tuned in by the circuit LC. When the grid is made more positive by the signal the electron current flowing through its meshes is increased, and when it is made more negative the current flow is reduced, so that the potential changes due to the signal are thus able to cause variation in the current drawn from the plate circuit battery, and in this way the signal is amplified.

In 1913 C. S. Franklin coupled the plate circuit to the tuned grid circuit of the valve with the object of reducing the decrement in the grid circuit by feeding energy into it from the plate circuit battery, which operation is called "retroaction" or "regeneration," and the same year A. Meissner, using a Lieben-Reiss three-electrode valve with a lime-coated platinum filament, carried this operation one step further by employing a coupling of such a value that the energy fed back into the grid circuit compensated for all the circuit losses, so that oscillations once started tended to continue until one or other of the battery circuits was broken, and he thus produced the first valve oscillation generator. In the Meissner circuit (fig. 2) the oscillation frequency was controlled by the constants of the circuit  $LpLgC$ , but it can be understood that the arrangement may be simplified if necessary by leaving out that circuit altogether and coupling  $Lg$  direct to  $Lp$ , the oscillation frequency desired then being obtained by connecting a condenser of the necessary capacity across one of these coils.

FIG. 2.—The Meissner valve oscillator circuit.

5. *Direction Finding.*—The practical application of the Bellini-Tosi system of wireless direction finding—partly based on researches carried out by A. Artom—now commenced to receive attention. Most systems of direction finding are based on the

principle that for maximum signal intensity the plane of the receiving antenna, or pick-up circuit employed, must lie in the direction of the propagation of electromagnetic waves.

Bellini-Tosi in 1907 used two triangular aeriels erected in vertical planes at right angles and on the same axis, and with free ends at each apex. In the base of each aerial fixed field coils were introduced, also mounted at right angles, and on the same axis as a search coil. The direction of the resultant field of the signal currents in the two field coils was found by rotating the search coil—to which was attached a pointer moving over a scale—until strongest signals were obtained, when the scale deflection which actually indicated the angle between the axis of the fixed and moving coils also gave the angular direction of the signals relative to the two aeriels. The open top antennae confined the utility of the D.F. equipment to short wave lengths and complicated the tuning.

The system was adopted and modified by the Marconi Company in 1912 for ship use, when the antennae were altered to closed loops, each of which was tuned at the base by an adjustable condenser.

6. *Wireless Telephony.*—The employment of the Poulson arc generator from 1906 onwards gave an impetus to the development of wireless telephony, and an appreciable advance was made by the invention by Majorana in 1908 of a heavy current liquid microphone which enabled speech to be transmitted from Rome to Sicily, a distance of 300 miles. In 1909 the Colin-Jeanne arc apparatus was in use from Toulon to a French cruiser 100 m. away; in 1910 successful tests were carried out in the United States over a distance of 490 m., and in 1912 the Vanni liquid microphone used with an arc transmitter enabled speech to be carried on from Rome to Tripoli—600 miles.

Development along new and more practical lines followed the invention by Meissner in 1913 of the valve oscillator and its use as a carrier wave generator for communicating between Berlin and Nauen, and the necessity for a heavy current microphone also disappeared with the arrival of the valve amplifier. In 1914 Marconi carried out a number of tests with valve transmitters and receivers on Italian war vessels up to a range of 45 miles.

The outbreak of war brought European long range telephone tests to a temporary standstill, but the American tests were continued, and in Oct. 1915, by employing 300 valves in the oscillator and modulator circuits, speech communication was effected when transmission conditions were favourable from Arlington to Eiffel Tower, Paris, a distance by great circle of 3,080 m.; also during the same series of tests long distance telephony from New York to Arlington by land line and Arlington to Hawaii by wireless was achieved, the total distance being over 5,000 miles.

7. *Wave Propagation Theories.*—To explain the propagation of electromagnetic waves such as are used in wireless telegraphy to great distances round the earth, Oliver Heaviside in 1901—reviving a theory first advanced by G. F. Fitzgerald in 1893—discussed the possibility of the existence in the upper atmosphere of a conducting and reflecting shell of ionised gas, and the name "Heaviside layer" has since been given to this hypothetical region.

Electromagnetic waves are guided by the surface of a conductor, and many attempts were made from 1909 onwards by Poincaré, Nicholson, MacDonald and Love, taking the ideal case of a perfectly conducting earth, to show that diffraction accounted for the intensity of the signals received at a distance. But the calculated results always came out very much too low.

The influence of night effect, first noticed by Marconi in 1902 when, on the S. S. "Philadelphia," he found a daylight range of 900 m. extended to 1,500 and 2,000 m. at night, was further demonstrated by him in 1911 by charts showing the daily variations of signals received at Clifden from Glace Bay over a period of 12 months, an average example being given in fig. 3. W. H. Eccles in 1912 advanced the theory that the presence of free ions of atomic dimensions at some considerable distance above the earth's surface would have the effect of increasing the velocity of those electromagnetic rays in the wave which passed through the region occupied by these ions, with the result that the top of the

FIG. 3.—24 hours' strength of Signals' Chart.

wave front would be given a lean forward, and this would cause the direction of propagation to bend down again towards the earth. As an example, about 16,000 gaseous ions per cubic centimetre would be required for a wave length of 6,000 metres.

It was suggested that this ionised region disappeared during the night, leaving the more clearly defined Heaviside layer above, to act as a reflecting surface.

As a result of tests carried out from 1910 to 1913 by the United States Navy, transmitting from Brant Rock to cruisers out in the Atlantic up to a distance of 1,000 m., the well known Austin-Cohen empirical formula for daylight range was deduced, namely:—

$$I_2 = 4 \cdot 25 I_1 \frac{h_1 h_2}{\lambda d} e^{-ad/\sqrt{\lambda}}$$

where  $I_1$  and  $I_2$  = transmitting and receiving antenna currents respectively.

$h_1$  and  $h_2$  = transmitting and receiving antenna heights in km. respectively.

$\lambda$  = wave length in km.

$d$  = distance between stations in km.

$a$  = dissipation constant = 0.0015 in daylight over sea.

8. *Imperial Wireless (I).*—Proposals for long distance transmission between outlying parts of the British Empire had meanwhile been taking definite shape.

The first scheme for Imperial wireless communications was submitted by the Marconi Company to the British Colonial Office in 1906, and the experience gained in running a Trans-Atlantic service between Clifden, Ireland, and Glace Bay, Canada, which was opened to the general public in Feb. 1908, led this company to ask for powers in 1910 to erect within three years, and subsequently maintain and operate entirely at its own expense, a chain of 19 stations throughout the British Empire. The practicability of the proposal received additional support from the results of the tests made by Marconi in Sept. of that year, when, on a voyage from Italy to the Argentine in the S.S. "Principessa Mafalda," he was able to receive messages from Clifden by day and night up to a range of 4,000 statute m., and night signals up to 6,000 m.; and also by the successful tests carried out towards the close of the same year by the Italian Govt., partly over sea and partly over large stretches of desert between Coltano and Massaua (Italian Eritrea), a distance of 2,400 miles.

In 1911 the question was discussed at the Imperial Conference and in 1912 the Marconi Company entered into a contract to erect six stations in England, Egypt, East Africa, South Africa, India and Singapore for the British and Dominion Governments, the chain to be completed by the Marconi Company's own stations which would be erected in Australia and Canada.

Germany, America and France followed the lead of what was being done in England and Italy, each devising and commencing the constructions of its own national network for world-wide radio communication.

As regards the British scheme various delays ensued. A Government committee under Lord Parker was appointed "to consider and report on the merits of the existing systems of long-distance wireless telegraphy and in particular as to their capacity for continuous communication for the distances required by the Imperial chain."

Poulson arcs were said to be working over long distances in America. R. Goldschmidt in Germany had produced in 1908 a high frequency alternator which was in effect a rotary frequency multiplier, depending largely on the principle of resonance; and E. F. W. Alexanderson in 1909 had made a practical success in the United States in the direct generation of electric waves by means of a high frequency alternator of the inductor type, employing a high rotor speed, an extremely small gap and the maximum possible number of coil elements on the stationary armature, the current generated being suitable for energising an aerial tuned to the same frequency.

The report of the committee was issued on April 30 1913. It stated: "The Marconi system is at present the only system of which it can be said with any certainty that it is capable of fulfilling the requirements of the Imperial chain"; and, although this remark applied to tuned spark or damped wave transmission, the committee also reported that "The only continuous high frequency generator we have yet seen tried with success over long distances is the Marconi continuous high frequency machine to which we have already referred."

This machine produced continuous waves by the "timed spark" method, introduced by Marconi in 1912, and was the first successful commercial attempt at the production of continuous wave impulses of high power in the aerial.

The result was obtained by the successive superimposing, correct in phase, of a number of trains of waves of identical amplitude and damping, which produced the effect of continuous

wave oscillations of a constant amplitude; and this system, having an available power of 300 kw. is still used commercially at Stavanger, Norway, for communication with the United States, and was the one employed during the first transmission of wireless messages from England to Australia in 1918.

The outbreak of the War stopped all further work on the contract in December 1914.

## II. WIRELESS DURING THE WAR

9. *Field Army Wireless.*—At the outbreak of the War the British military equipment had its spark transmitter and crystal detector and pack and wagon sets suitable for army purposes; but from Oct. 1914 wireless had to make fresh beginnings in order to adapt itself to the special conditions of trench warfare, which called for efficient short distance services and extremely portable and unobtrusive apparatus. The company or battalion headquarters signalled brigades by power buzzer employing earth currents; brigades signalled divisional headquarters by 50 watt spark set; divisional headquarters signalled corps directing stations by 120 watt spark set, and corps directing stations signalled corps headquarters by  $1\frac{1}{2}$  kw. light motor set. Later on the French army developed with much success a small frame aerial set with valve receiver for use in dugouts.

10. *Direction Finding (II.).*—British Army D.F. stations were erected at Abbeville and Blendecques, and several British Navy D.F. stations along the east coast of England. Under the charge of Captain H. J. Round, they were used as position finders of German transmitters on board ship, behind the lines and in the air, the position of land and sea stations being ascertained by simultaneous measurements of the angles to the objective transmitter from the base lines of known length between two or more D.F. stations, which allowed the position of enemy stations to be found by triangulation.

The Bellini-Tosi tuned-aerial system proved suitable for locating spark stations of fixed wave-lengths, but C.W. arc stations required constant and rapid searching not only for direction but also for wave-length, and an aperiodic aerial system, consisting of two closed loops of wire in vertical planes, and at right angles connected to suitable field coils in the radiogoniometer, was introduced for this purpose, the only tuning necessary being in the circuit of the search coil, thereby enabling the D.F. stations to give very satisfactory results during daylight. The removal of wave-length limitations enforced by the tuned aerial system was an important improvement, and the introduction at the same time of an efficient and robust valve and multi-stage amplifier in a metal screening box very greatly increased both the range and utility of the apparatus.

The movement of a well-known German wireless control vessel a few miles to the northward on May 30 1916, detected by D.F., led the Admiralty to the correct deduction that the German Fleet had left Wilhelmshaven for a position in the Jade river ready to put to sea. This decided Admiral Jackson, then first Sea Lord, to send the Grand Fleet out to meet it, and the battle of Jutland the following day was the result.

The traffic handled during the War by the Admiralty D.F. stations and the Marconi stations controlled by the Admiralty amounted to some 80,000,000 words intercepted and some 8,000,000 words transmitted.

11. *Naval and Other Stations (II.).*—Within 10 months of war being declared all German colonial wireless stations had either been destroyed or taken over, and by the end of 1915 the Admiralty had 14 additional strategic stations, 11 of 30 kw., 2 of 100 kw. and one of 150 kw. rotary spark type working in different parts of the world.

By the year 1917 arc transmitters were in general use in the Navy, and valve transmitters in the following year.

Wireless was of the greatest value in keeping submarines in touch with their parent ships, and the routine of rising to the surface, erecting mast and aerial, sending code signals, and lowering mast and aerial and then submerging was reduced to a minimum.

A notable achievement was the picking up of signals on a frame aerial by a submarine while submerged in the Baltic.

12. *Royal Air Force.*—The Royal Air Force, working in conjunction with the Royal Artillery, found wireless invaluable for gun-spotting. Thus in a sample month for 1,562 shots fired the calls received from flash-spotting machines were 74,201, while the percentage received to those missed from all causes was 86%; and this in spite of intense activity in the ether, and with as many machines crowded in on the front as possible, undue mutual interference being avoided by a careful selection of wave-lengths and by note tuning. Just before the Armistice there were 600 aeroplanes transmitting one-way from machine to ground by means of spark apparatus, working in conjunction with some 1,000 ground stations, but two-way transmission was employed to assist the work of the long range guns, which necessitated flights to a distance of 15 m., so that communication might be maintained with aeroplanes when over the targets. The transmitting range from machine to ground increased to 100 m. late in 1917, when C.W. valve transmitters were employed by night bombing squadrons.

13. *Aircraft Wireless Telephony (II.).*—Aircraft wireless telephony was developed during the War by the Royal Air Force at Brooklands. The first satisfactory aircraft valve transmitter, which required a special form of microphone suitable for responding to speech close to the mouthpiece but insensitive to machine noises, was in use for transmission from aeroplane to ground in 1915, and in 1916 two-way working was obtained by the use of a three-valve receiver in the aeroplane, and an efficient screening system which stopped interference in the receiver from engine ignition impulses.

In 1917 inter-machine wireless was in use for formation control, and at the time of the Armistice the equipping of all squadrons with the new apparatus was well in hand. The working ranges were 20 m. from machine to ground and three m. from machine to machine.

The aeroplane aerial was a single wire with a metal bob at the end which was run out from a winch so that it trailed below the machine, and the fuselage was employed as a counterpoise.

14. *The Armistice.*—The historic message sent out from the Eiffel Tower at 5 A.M. on Nov. 11 1918:—

“*Marshal Foch to the Allied Commanders: Hostilities will cease at 11 a.m.*”—was delivered to more than half the troops by wireless.

## III. WIRELESS SINCE THE WAR

15. *Direction Finding (III.).*—It had been noticed that position finding at night often proved to be unreliable, particularly at about sunset, and the results obtained by searching with suitable frame aerials led T. L. Eckersley in 1918 to express the view that the error was due to rays reaching the earth from the upper atmosphere.

A vertical aerial picks up signals from all directions. A rectangular or frame aerial gives strongest signals when its plane lies in the line of propagation of signals, but it does not indicate the bearing of the direction; and the search coil of a Bellini-Tosi D.F. in the same way shows direction but not bearing.

By combining a vertical aerial with a Bellini-Tosi system both direction and bearing can be found, the polar diagram of reception having a heart-shape, with one position only for the search coil at which signals vanish, and this is  $180^\circ$  from the true direction of the transmitting station. However much the heart-shape may be distorted by the vertical rays of night effect, it is found that the position where signals vanish remains unchanged, so that it can be used as a reliable indication of bearing.

The heart-shape arrangement came into use after the War, and is now employed on all ships fitted with Marconi apparatus, and also at the receiving stations of the Marconi transatlantic and continental wireless services at Brentwood.

16. *Aircraft Wireless Telephony (III.).*—With the advent of commercial flying the power and range of the wireless telephone equipment of R.A.F. type was increased, and in this improved form was given its first air test early in 1919.

The first commercial machine to be fitted was the Handley-Page GEALX which made the journey from Cricklewood to

Paris on March 4 1920, when part of the route was foggy, and the information received by wireless that there was clear weather ahead proved of value. During 1920 and 1921 every British machine regularly flying on the London-Paris route was equipped with Marconi 100 watt air-driven generator, five-valve receiver wireless telephone sets; and the landing at Croydon, the London air terminal port—which gives aeroplanes their bearings en route—is entirely controlled by wireless telephony.

The latest apparatus adopted as standard for commercial airways includes 150-watt air-driven double current generator, one oscillator and two modulator valves and five receiver valves, and works normally on 900 metres.

17. *Wireless and Long Distance Flights.*—The use of wireless for long distance flying was illustrated by the transatlantic voyage of the airship "R34" in 1919 from East Fortune, 20 m. from Edinburgh, to Mineola, Long Island, N.Y., taking four days 12 h. 15 min., and Mineola to Pulham, Norfolk, three days, one h. 56 min., during which she was in touch by spark and C.W. telegraphy with Clifden and Glace Bay and many ship stations for the whole period of her cruise. The transatlantic flight of Commandant Franco from Spain to South America on the Dornier seaplane "Ne Plus Ultra," in Jan. 1926 is another instance. This was an all-metal machine fitted with a Bellini-Tosi D.F. equipment, by which it obtained its bearings to Las Palmas at a distance of 700 km., and navigated with accuracy through mist and cloud solely by this means. At the end of the ocean flight of 1,440 m. the plane, relying on D.F., made the small island of Fernando Noronha with great accuracy. During the Amundsen-Ellsworth polar flight in May 1926 the airship "Norge" was in communication with Europe by wireless when over the Pole, and by the same means obtained its bearings and received meteorological reports from stations round the Polar basin.

18. *Thermionic Valve Development.*—Thermionic valves depend for their operation on (a) a free supply of electrons, (b) an electron current through the valve drawn from this supply. The first requirement is met by means of an incandescent filament, from the surface of which under suitable conditions the electrons evaporate; or the filament may be used simply as a heater of an alkaline earth material which emits a very plentiful supply of electrons when red hot.

The second requirement is met by removing practically all gas atoms from the valve and by imposing a positive potential on the plate or anode, when, on completing the electric circuit externally from the plate to the incandescent filament which is made the cathode, an electron current flows through the valve.

The filament was first made of carbon, then platinum; later the platinum was coated with lime and barium oxide; tungsten superseded platinum; and now thoriated tungsten is employed by one manufacturer, and lime-coated platinum alloy by another for the filaments of an important group of valves known as dull emitters. The dull emitter allows emission to take place when the filament is only dull red, and therefore calls for only a small current and less filament battery volts than is necessary for a bright filament.

The recognition that stable operation over a wide range of working conditions could only be obtained by removing every particle of gas possible from the valve—as demonstrated by the research work of Irving Langmuir in 1915, employing tungsten filaments—brought about improvements in the methods used for obtaining a high vacuum, and the successful maintenance of a high vacuum under load conditions made possible all the later advances in thermionic valve engineering.

A valve containing an appreciable quantity of gas is said to be "soft." As an example, the Lieben-Reiss valve contains mercury vapour at a barometric pressure of 0.01 mm. A "hard" valve should have a lower gas pressure than 0.0001 mm.

The Sprengel and Toepler types of mercury pump originally employed, although efficient and suitable for exhausting to 0.00001 mm., are too slow in operation and require too much attention for commercial use, and it is now the general practice to use a combination consisting of a rough pump and a fine pump. Thus a Geryk piston pump may be employed to reduce the

air pressure to 0.25 mm. and a Gaede piston pump to reduce this further to 0.00005 mm. or, the rough pump may reduce the air pressure to 10 mm., and a Gaede rotary mercury pump, or Gaede oil pump, may carry on the exhaustion to 0.00007 mm. With an additional Gaede oil pump in series the pressure can be lowered to 0.000007 millimetres of mercury.

The Gaede molecular pump—which works on the principle that in a partial vacuum gas friction on a moving surface will cause the molecules of gas to travel with the surface—allows a fine pressure of 0.0000003 mm. to be obtained if the rough pump first reduces the pressure to 0.05 mm.; and finally, if a Gaede oil pump is used as a rough pump to reduce the pressure to 0.007 mm., a Langmuir condensation pump can then carry on the exhaustion to any desired extent, a typical value measured by an ionisation gauge being 0.00000007 mm., or  $10^{-4}$  bar.

The gas atoms absorbed or occluded by the various parts of the valve—the lead glass or lime glass employed, the metal of the grid and of the plate—must all be removed if the vacuum is to be retained under working conditions. For this reason the valve and fittings are heated during exhaustion, and by the application of a high potential to the plate and grid these parts are also bombarded by high speed electrons drawn over from the incandescent filament, the gases expelled in this way being water vapour, carbon dioxide, carbon monoxide and hydrogen. The last remnants of gas in certain cases are also removed by chemical absorbents such as calcium, magnesium or red phosphorus, which impart a blackened or silvered or a yellow appearance to the glass bulb.

Platinum, copper, aluminium and nickel have been used at various stages of receiving valve development as the metals for the grid and the plate; and for transmitting valves which in certain cases work with the plate red hot it has been found best to make these parts of nickel or molybdenum.

The grid may be of an open or close mesh of wire; or a wire wound spirally or zigzagged.

If a resistance is connected in the plate circuit of a three-electrode valve, a change in voltage applied to the grid results in a certain change in voltage across this resistance, and the ratio of these two values is called the *voltage magnification* of the valve circuit. This value increases with the plate circuit resistance, but when the resistance is sufficiently large tends to become constant, and it is then called the *magnification constant* or *M* value of that particular design of valve. The receiving valves in use to-day have *M* values from  $2\frac{1}{2}$  to 20, and transmitting valves from 8 to 200; in each case higher *M* values are obtainable; but they are not called for.

FIG. 4.—"R" receiving valve. FIG. 5.—"V 24" receiving valve.

The Marconi R (bright filament), (fig. 4), which can be used as a rectifying or an amplifying valve, has plug-in contacts, is suitable for anode voltages of 30 to 100 and has an *M* value of 9. It resembles in appearance the French valve used during the War. Except that its filament is a dull emitter, the Marconi D.E.R. valve has the same form and characteristics as the R.

The Marconi V24 (bright filament) (fig. 5) is a compact and robust type of amplifying valve which is held in position by four spring contacts. It is suitable for anode voltages of 20 to 60, and has an M value of 6. This was one of the British valves used during the War. The Marconi D.E.V. has the same form and characteristics but is a dull emitter.

The Marconi MT 9 valve (fig. 6) is suitable for working on a four kw. transmitter with anode voltage up to 12,000. It is able to dissipate up to 1.5 kw. at the anode, and has an M value of 90.

The power valve intensifies the problems connected with sealing metallic connection through glass, the difference in expansion of the materials employed, glass electrolysis and current leakage.

Quartz, which is able to stand high temperatures without fractures, has been used to a considerable extent instead of glass for the bulbs.

The quartz valve is more difficult to make and its cost is high, and the necessity for it disappeared with the invention of the water-cooled valve. This valve (fig. 7) represents an important new departure in manufacture, as the wall is half of glass and half of metal.

The metal part is the anode, and is fitted into a container through which a stream of water flows, taking away with it the heat generated at the anode.

In one method the anode insulation is maintained by using distilled water—which is a non-conductor—led through a length of rubber hose to and from the valve container; and in another method by employing a spray to break the water circulation into and out of the valve container, the insulation of the spray being such that with 10,000 volts on the anode the current through this channel to earth has the order of a few milliamps only.

Water-cooled valves of 10 kw. and 20 kw. capacity are the sizes in general use, although valves to take up to 100 kw. are also made.

The actual loss in a 10 kw. valve is of the order of 15 to 20%. Where maximum insulation, minimum plate to grid capacity and minimum loss are of first importance, as in short wave work, the

transmitting valve may be cooled by an oil circulating instead of a water circulating system.

19. *Post Office Stations (III).*—In 1926 there were in Great Britain and Ireland twelve post office stations engaged in ship and shore service. These are Wick, Cullercoats, Grimsby, North

Foreland, Niton, Land's End, Fishguard, Seaforth, Port Patrick, Valentia and Malin Head being spark stations of from  $1\frac{1}{2}$  kw. to 10 kw. power, keeping watch on 600 metres; while the 12th, Devizes, with its receiving station at Burnham, Somerset, is fitted for long range working to ships installed with continuous wave sets.

In the year 1925 distress calls from 84 ships were received and dealt with, and the total shore station traffic for 1925 amounted to over 4,000,000 words.

Post office stations engaged in point-to-point traffic are Stonehaven, Leafeld, near Oxford, Caister in Norfolk, Northolt and Rugby, the control and operating being done at the Central Telegraph Office, London.

20. *Commercial Point-to-Point Stations.*—Commercial point-to-point high speed duplex radio telegraphic services working at 90 to 150 words per min. were opened by the Marconi Company in 1922 to 1923 between their centralised operating station at Radio House, London, valve transmitting stations at Ongar and Carnarvon, receiving station at Brentwood, and the corresponding continental stations at Paris, Berne, Madrid, Vienna, Barcelona, Belgrade and Moscow on wave-lengths ranging from 2,950 metres to 5,045 metres; the same English stations also working across the Atlantic to Glace Bay, New Brunswick, Marion, Tuckerton, Rocky Point and Coram Hill on wave-lengths from 5,000 metres to 14,000 metres, and receiving on wave-lengths from 7,700 metres to 17,500 metres. A valve telegraph transmitter of 1926 design is shown in Plate fig. 4.

Directional reception is employed at Brentwood, and the tuned-in signals then pass through a high frequency filter of several stages, being afterwards heterodyned as described below to produce a frequency of about 2,500 cycles; they are next rectified and passed through a low frequency filter to a valve bridge circuit, then on by land-line to Radio House.

The operating speed of the Marconi Wheatstone automatic transmitter is adjusted to traffic requirements, and may be anything up to 150 words per minute. The recording apparatus includes (1) a high speed Creed receiver, which makes perforations on a tape identical with those on the tape of the Wheatstone transmitter, and a Creed printer which converts the perforations into printed characters on another tape; and (2) a Marconi undulator or trailing syphon recorder, capable of working up to 200 words per min., which is employed in place of the Creed apparatus when atmospheric conditions cause printed messages to be mutilated. The total traffic of the Marconi services for 1925 exceeded 20,000,000 words.

21. *"Heterodyning" Continuous Wave (C.W.) Oscillations.*—To detect continuous wave signals the current is "heterodyned," that is, another current is superposed on either the transmitter—or, more usually, the receiver circuit—of almost identical frequency, so that by suitably adjusting the difference of the two frequencies a "beat" note having a pitch within the audible range is produced. Thus if the signal current has a frequency of  $10^6$  cycles (3,000 metres), to give it an audible frequency of  $c''-512$  the heterodyning current must have a frequency of  $10^6$  plus or minus  $512 = 2,985$  metres or 3,015 metres, being a difference of 0.5% or 15 metres plus or minus in wave-length. But if the signal current has a frequency of  $10^7$  cycles (30 metres), then the heterodyning frequency to give the same audible note of  $c''-512$  would differ from it by only 0.005%, corresponding to wave-length difference of only plus or minus 0.0015 metres. For a note of two octaves higher, namely 2,048, and a signal current frequency of  $10^7$ , the wave-length difference would still only be 0.006 metres.

Such adjustments on short waves would be too critical, and the practice is to use two stages, the first giving a beat note having a frequency well above the audible limit and the second a beat note within the audible limit.

22. *Wave-length Allocation and the Number of Channels Possible for Radio Communications.*—The ether is becoming congested with radio traffic over a considerable range of wave-lengths, and it becomes necessary to consider the number of possible channels obtainable by the use of different wave-lengths.

FIG. 6.—"MT9" transmitting valve.

FIG. 7.—Marconi water-cooled transmitter valve.

Those in use at the present time are:—

| Wave-length,<br>Metres | Frequency<br>Kilocycles | Service                                                      |
|------------------------|-------------------------|--------------------------------------------------------------|
| 5 to 7                 | 60,000 to 42,855        | Beam "Lighthouse"                                            |
| 7 to 9                 | 42,855 to 33,333        | Short wave military stations                                 |
| 13 to 100              | 23,077 to 3,000         | Beam stations including transoceanic stations on this system |
| 150 to 200             | 2,000 to 1,500          | Trawlers, aircraft and other small mobile sets               |
| 220 to 240             | 1,364 to 1,250          | Lighthouses and lightships                                   |
| 260 to 300             | 1,154 to 1,000          | British broadcasting                                         |
| 350 to 300             | 857.1 to 1,000          | Ships with spark sets                                        |
| 450 to 600             | 666.7 to 500.0          |                                                              |
| 700 to 800             | 428.6 to 375.0          |                                                              |
| 850 to 950             | 352.9 to 315.8          | Aircraft                                                     |
| 1,000 to 1,000         | 300.0 to 300.0          | Beacon stations                                              |
| 1,000 to 1,550         | 300.0 to 193.5          | Military fixed stations, aircraft and broadcasting           |
| 1,600 to 2,100         | 187.5 to 142.9          | High power British broadcasting                              |
| 2,650 to 2,650         | 113.2 to 113.2          | Ships using C. W. sets                                       |
| 8,000 to 8,000         | 37.5 to 37.5            | Medium power transcontinental stations                       |
| Upwards                | 37.5                    | High power transoceanic wireless stations                    |

The allocation of wave-lengths may be made on the basis of a definite percentage difference between them, or what now promises to become the accepted method, on separations of a definite numbers of cycles. This will give many more short-wave channels than long ones. For instance, if steps of 5,000 cycles are chosen, then 5 metres difference in 100 metres or  $3 \times 10^6$  cycles, would give 30 channels; whereas 5 metres difference in 1,000 metres or  $3 \times 10^6$  cycles would only give three channels. The whole working range of wave-lengths for all purposes is likely to extend from 5 metres to 30,000 metres, which gives a possible number of channels on the above basis of 11,998, of which 95% would be on shorter wave-lengths than 100 metres. But as it is possible to work on narrower limits and with greater steadiness on long wave than on short, the tendency will be to limit the band at 5 metres, for instance, to something like 100,000 cycles, or within 0.16%, while at 30,000 metres the width of band may be confined to 200 cycles, or 2%.<sup>1</sup>

23. *Wave Propagation Theories (II).*—The influence of diffraction on the propagation of electromagnetic waves to a distance was further examined by G.M. Watson in 1918, and the mathematical solution put forward by him is now accepted as correct.

He showed that the received current in the Austin-Cohen formula should be inversely proportional to  $\sqrt{\sin \theta} \lambda^{1/6}$ —where  $\theta$  is the angle at the centre of the earth subtended by the distance  $d$ —and the index of the exponential factor should be

$0.00376 \frac{d}{\sqrt{\lambda}}$ ; but as the intensity of signals at distances of 6,000

m. were still found to be much greater than the values calculated on this new basis, Watson in 1919 concluded that refraction and reflection of the rays earthwards were also involved, such as would be obtained if at a height of 100 km. above the earth the specific resistance of the atmosphere per centimetre cube were  $6.95 \times 10^8$  ohms.

Larmor in 1924 continued the discussion of the refraction theory, and pointed out that, to account for the bending of electromagnetic rays without extinction, all action by conduction or other dissipation must be excluded, and that the influence at work must be purely dielectric in character.

<sup>1</sup> Recent measurements of the wave-length of light give a value of  $2.9982 \times 10^8$  metres per second instead of  $3 \times 10^8$  metres per second. This figure should therefore be used in effecting conversions where necessary.

Eccles has shown that by postulating the existence of heavy ions in the middle atmosphere caused by incident ultra-violet radiation, which have a limited free path, the bending of the waves can be accounted for; and Larmor extended this theory by showing that the finite free sways of electrons or light ions without collision in the ultra-rarefied gas of the upper atmosphere must augment the speed of the exciting waves. Such a layer, in which a sheaf of horizontal electric rays, provided they are long enough, will travel without loss by absorptional scattering, must be high up within the auroral domain, concentration in this stratum being due to the potent influence exerted on the velocity of long waves by the free ions of small inertia interacting with them.

By this theory, electric radiation to great distances involves a sheaf of rays whose breadth may be only a fraction of one of its long wave-lengths, which travels along a surface of constant index, while it has to remain concentrated without spreading either by refraction or by diffraction.

24. *Wave Propagation Tests.*—Measurements made by L. F. Fuller in 1915 between the arc stations at San Francisco and Honolulu, by G. Vallauri in 1919 between Annapolis and Leghorn, and particularly by Lieut. Guierre for the French Govt. in 1919 to 1920 during the cruise of the S.S. "Aldebaran" to the antipodes receiving from Nantes and Lyons, showed that the Austin-Cohen formula ceased to apply for distances exceeding 2,000 miles.

The Marconi Company having devised a portable instrument for accurately measuring in absolute units, micro-volts per metre, the potential gradient of signals, sent out trained observers in 1921–2 to all parts of the world to measure the strength of signals received on wave-lengths from 5,800 metres Clifden to 23,450 metres Bordeaux, on known power from the principal European and American stations, the intensities of atmospherics and the direction and bearing of both signals and atmospherics being also noted; and from the information obtained, much of which has been published, reliable world transmission formulae covering all the requirements of the Imperial stations for working on long waves have been evolved.

The assumption made by Marconi so long ago as 1905, in a lecture before the Royal Institution, that signals would strengthen at the antipodes of the transmitting station, was confirmed, and it was also noticed that they always travel on a great circle round the earth, but that the direction of arrival whether by the shortest or longest path alters according to the wave-length, position of the sun and, in general, the conditions of the upper atmosphere.

25. *Imperial Wireless (III).*—The Imperial wireless chain again came up for discussion at the Imperial Conference of 1921. The British and Dominion Govts. were urged to erect the necessary stations. A Government committee reported in 1923 that the Post Office should own and operate directly all wireless stations for communicating with various parts of the Empire. In the case of Canada the present competition between the Post Office and the Marconi Company might be continued. As regards Continental Europe and the rest of the world, it was recommended that private enterprise be given all reasonable facilities to develop wireless communication. The Post Office then acquired a site at Rugby and proceeded with the erection of the first Imperial transmitting station, and this has been completed. The intention was to provide worldwide radio communication throughout the whole of the 24 hours, and the design is an example of the most recent long-wave practice (Plate fig. 3).

The aerial for telegraphic transmission, which has a capacity of 0.032 mfd., is supported by eight 820 ft. towers, while the aerial for telephonic transmission has a capacity of 0.02 mfd. and is supported by six such towers, two of which are shared with the telegraph aerial.

The power amplifier—consisting of three 18-valve units, each valve having an output of 10 kw.—feeds 500 kw. to the aerial valve through a coupled circuit.

The constancy of the wave-length is controlled by a valve-maintained tuning fork vibrating at 1,777 cycles per sec., which

is made to excite continuously a valve circuit tuned to the same frequency, but so constituted that it has a pronounced ninth harmonic, namely 16,000 cycles. This frequency is picked out, amplified, and finally acts as the control current of the power amplifier, and the aerial, therefore, radiates on the equivalent wave-length, namely 18,740 metres.

The total power used in the station for transmitting and auxiliary services is at present (1926) about 1,400 kw. when in operation for both telephony and telegraphy.

**26. Marconi Short-Wave Beam Transmission and Imperial Wireless.**—In 1916 Marconi returned to the study of short wave transmission as used by him in 1896, employing reflectors and three-metre damped waves on Italian war vessels, and under his direction further exhaustive tests were carried out by C. S. Franklin in 1917, 1919 and 1920, first at Carnarvon and later over 97 m. between Hendon and Birmingham, using reflectors on wave-lengths up to 15 metres, a valve transmitter being introduced in 1919.

A revolving beam spark transmitter 6.3 m. wave-length was fitted at Inchkeith on the Clyde, and demonstrated to the Commissioners of the Northern Lights in 1920, a permanent revolving reflector on the same wave-length being installed at the South Foreland in 1923. In April, May and June 1923 Marconi on the S.Y. "Elettra" at Madeira, and later at St. Vincent, received such strong signals comparatively free from atmospheric from a 97 m. reflector transmitter at Poldhu, working on one kw. to 12 kw. valve input, that he was convinced short waves could give reliable commercial services for the greater proportion of the 24 hours up to 2,300 nautical m. on one kw. power, this being the distance between Poldhu and St. Vincent.

Following the publication of the Government Report on Imperial Wireless, the Marconi Company therefore opened negotiations with the Post Office for the employment of short-wave beam transmitters for the Imperial stations.

Marconi's tests were continued on the same wave-length but with power up to 20 kw. in the autumn and spring of 1923-4, observations of signal strength also being noted at Montreal, New York, Rio de Janeiro, Buenos Aires and Sydney, N.S.W. The first direct message by short-wave wireless telegraphy from Poldhu was received at Sydney on April 30 1924, and the first direct speech by short-wave wireless telephony on May 30 1924.

In July 1924 an agreement was concluded between the Postmaster-General and the Marconi Company for the construction of wireless stations on the beam system, capable of communicating with Canada and of being extended to South Africa, India and Australia, the transmitting station to have an input of at least 20 kw. and the receiving station to have an aerial designed to focus received waves within an angle of  $30^\circ$ , the stations to be worked by remote control from the Central Telegraph Office, London, and to be capable of working at 100 words per min. each way for an average of 18 hours per day.

Following the publication of the agreement, work commenced on the erection of beam stations in South Africa, India, Australia and Canada, which, except for the hours of working—South Africa 11, India 12, Australia seven—are required to be identical in performance with the English beam stations.

The Poldhu transmitter having been modified to work with 15 Kw. on 92 m., 60 m., 47 m. and 32 m., the range trials were resumed in Aug. 1924, when Marconi on board the "Elettra" found the daylight range increased very rapidly as the wave-length was reduced. Also on 32 m. and 12 Kw. input, signals were received at New York, Rio and Buenos Aires when both terminal stations were in daylight, and Sydney, N.S.W., was able to read signals for  $2\frac{3}{4}$  out of the 24 hours.

In Oct. 1925, using 200 watts and 15 metres, transmission from Chelmsford to Buenos Aires was of such strength during daylight that a speed of 30 words per min. would be used; reaching a maximum with the sun at its zenith on the great circle track, while during darkness signals disappeared altogether.

Exhaustive tests have since been made by the Marconi Company of the daylight absorption factor of all wave-lengths down to one metre.

The English beam transmitting stations now in process of erection (1926) are Bodmin (Plate fig. 2), to work with Canada and South Africa; Grimsby, to work with India and Australia; and Dorchester, to work with the U.S.A. and South America; the three corresponding receiving stations (Plate fig. 1) being at Bridgewater, Skegness and Somerset.

**27. Wireless Telephony (II).**—Transatlantic one-way wireless telephony was carried out in 1919 between the Marconi Ballyunion station, County Kerry and Louisburg, Cape Breton, a distance of 1,800 m.; and in 1920 the first land-line to wireless and wireless to land-line duplex telephone service was opened to the public when the Californian and Santa Catalina Island systems were connected by a wireless link from Los Angeles to Avalon, a distance of  $31\frac{1}{2}$  miles.

Further transatlantic one-way transmission tests using 300 Kw. to the aerial and a special valve circuit radiating only "side-band" frequencies from the aerial were carried out in Jan. 1923 between the Rocky Point station, New York, and New Southgate, London, the speech being picked up on a 6 ft. frame aerial connected to special filter amplifier and wave-form correction circuits having the effect of restoring the carrier wave removed at the transmitter.

Transatlantic two-way tests on single side-band working duplex, between the British Post Office station at Rugby sending on 5,769 m. wave-length (52 kilocycles), and the Rocky Point station, New York, sending on 5,263 m. wave-length (57 kilocycles), and the respective receiving stations connected to subscriber lines, were begun in Feb. 1926.

The audible frequencies are comprised between 20 and 10,000 cycles per second. In wireless telephony currents having frequencies between these limits are superposed on the carrier wave frequency  $x$ .

If clear speech only is required, and not music, the essential audible frequencies lie between the narrower band of 100 to 3,000 cycles per second.

Then it can be shown that for clear speech the total band of modulated carrier wave frequencies involved lies between the limits  $(x-3,000)$  and  $(x+3,000)$ ; the frequencies below  $x$  are classed in one group as a side-band, the frequencies above  $x$  are classed in another group as a second side-band, and the speech wave-form is completely outlined by either side-band. If one of them is filtered out before transmission the total width of band employed will be halved and the power transmitted will be halved, and there need be no loss of quality or distinctness if the correct frequencies can be again inserted at the receiver. This is what is done, and a further economy is also obtained by treating the ineffective frequencies between  $x$  and  $(x \pm 100)$  in the same manner.

**28. Broadcasting.**—While the technical development of wireless telephony was proceeding with success, its commercial future, apart from its use as a link across water between two land-line systems, appeared to be problematical, as for accuracy, speed and number of channels available for messages it was considered that wireless telephony would always have preference.

The general public were led to take an interest in it as a novel form of communication which could be used by anyone able to talk into a telephone, and this interest was fostered by using it as a source of entertainment to transmit songs, musical items and speeches by public personages between recognised stations ashore or afloat which could both transmit and receive. Feb. 23 1920 saw the opening of the first wireless telephone broadcasting service in the world, when a programme of vocal and instrumental music for two half-hourly periods each day for a fortnight was transmitted on a 15 Kw. valve set from Chelmsford on 2,800 metres, the wave-length used by Poldhu for the ship telegraph news service. Amateurs and the shipping companies were advised that this would take place, and many reports of good reception at 1,000 and 1,200 m. distant on crystal sets, and up to 1,400 m. on valve sets, were received. The Hague concerts commenced on April 29 of that year, and in June and July other concerts by well-known artists took place at Chelmsford, which in Northern Europe were received by wireless and put through the telephone

FIG. 1. Marconi short wave beam station receiver. Panels *Ae. 1, Ae. 2, Ae. 3, Ae. 4*. Feeder coupling units of 26 m., 60 m., 26 m. and 60 m., waves respectively. Panel *a*, Input tuning circuit: 1st rectifier and 1st oscillator. *b*, 1st filter amplifier. *c*, 2nd rectifier, with listening point, and 2nd oscillator. *d*, 2nd filter amplifier. *e*, Main rectifier and listening point. *f*, Control switchboard. exchanges of the large Scandinavian towns and thence to the subscribers' lines. The musical items encouraged a great deal of unofficial listening-in, the amateur movement grew apace, and manufacturers in the United States discovered that a vast trade in receivers only was springing up, which they proceeded to encourage by the erection of stations solely for transmitting to, and entertainment of, the general public. The publicity afforded and utilised brought an income to the transmitting stations from advertisers, the number of listeners-in officially recognised and catered for rapidly increased, and the United States 1921-2 boom in broadcasting arrived.

Broadcasting, however, developed more slowly in Great Britain. The Postmaster-General finally gave permission for vocal and gramophone selections and calibration signals for amateurs to be broadcast from Writtle, Essex, and the first transmission on 700 metres and 250 watts took place Feb. 14 1922. The first station of the British Broadcasting Company, 2LO, at Marconi House, London, commenced its transmission on 360 metres and 1½ kw. to the aerial on Nov. 14 1922, and, with the issue of a formal licence by the Postmaster-General to the British Broadcasting Company in Jan. 1923, wireless telephonic reception, with all the possibilities it implied now fairly well realised, received every encouragement from the Government, and is now an ineradicable habit of millions.

Broadcasting demands an unvarying frequency for the carrier wave in order that no readjustment of a receiver may be necessary during the course of a programme, and also to allow sharply tuned receivers to be used, so that there may be the minimum interference between broadcasting stations working on slightly different wave-lengths.

FIG. 8.—Lay-out of broadcast transmitter.

The essential equipment of the transmitter is a circuit P.A., (fig. 8), the power oscillator or magnifier, which is a valve oscillator circuit of carrier wave frequency of which the open aerial forms a part.

D, the drive circuit, a complete self-oscillator having a closed H.F. circuit and, therefore, an invariable oscillation frequency which controls the magnifier and compels it to run at the same invariable frequency.

M, the modulator, which is so connected to the magnifier as to modify the amplitude of the carrier wave according to the speech frequencies to be broadcast.

Sometimes another panel is provided if the H.T. supply is alternating current, in order to rectify it and smooth out the ripples before the rectified current is supplied to the anodes of the valves.

X is the microphone in the studio S<sub>1</sub>, which is connected to the input of the microphone amplifier X.Amp., the output of which goes on to the line. On arriving at the transmitting station T<sub>1</sub> the line currents are put through a second or line amplifier L.Amp., the output from which is connected to the input of the modulator panel M, to build them up to the values required to work the first stage of the modulator so that it controls to its full capacity.

The modulator panel may contain the circuits of several stages of amplification, in passing through which the control currents, which originate in the microphone circuit, finally reach such a magnitude that the maximum modulation possible is finally applied to the carrier wave current.

A typical method of modulating the carrier wave, known as "choke control," is illustrated in fig. 9. When speaking into the microphone M, changes in potential take place on the grid

of the modulator valve X, as this is connected to the secondary of the microphone transformer T<sub>1</sub>. Owing to the presence of the choke L<sub>x</sub> in the modulator plate circuit, corresponding changes in the plate potential of X also take place, and as this plate is connected to the plate of the main oscillator valve O, the fluctuating potentials originated by speech are thus made to control the amplitude of the aerial current.

FIG. 9.—Choke control.

By inserting the microphone M, with its circuit and transformer T<sub>1</sub>, in the oscillator grid circuit in place of the resistance R, the modulator valve and choke can be dispensed with, the modulation then being obtained by "grid control," which is a good, but less effective, method.

For simultaneously broadcasting, or "S.B.", the output from the microphone amplifier in the studio S<sub>1</sub> (fig. 8) is connected to the input terminals of two or more land-line amplifiers at two or more transmitting stations, such as T<sub>1</sub> and T<sub>2</sub>.

While it is always necessary that the carrier wave should have an unvarying frequency, it is much more vital with short waves than with long.

Short-wave amplification is more difficult than long-wave, as the condensers in the closed tuned circuits are so small that the capacity between the plate and grid of the valve becomes of importance in regard to the capacity coupling between the grid and plate circuit, so that reaction effects tend to take place.

For this reason the incoming short-wave speech-bearing currents are first heterodyned in the receiver to produce long-wave currents well above the audible range; this long wave is then amplified up in the normal manner and finally rectified, thus leaving only the speech frequencies, which are dealt with in the usual way. This is the method usually employed for the relaying of transatlantic short-wave telephony before it is put on to the land-line feeding a B.B.C. transmitter. This is the superheterodyne method which is sometimes used for the "wireless link" between studio and transmitting station in place of the land-line. It cuts out interference, gives greater selectivity to the receiver and permits more amplification to be used than with the original short-wave unheterodyned.

When retroaction is employed in a receiver which is being tuned in to a given transmission, the coupling between the grid and plate circuits may be increased to such a value that the valve circuit becomes an oscillation generator, and its current then heterodynes with that of the carrier wave received, thus causing a variable beat note of diminishing pitch to be heard in the telephones as the resonant point is approached, and of increasing pitch as the adjustment passes the resonance point and puts the circuit more out of tune. This variable note produced when searching for the in-tune adjustment is called "howl."

In many such receivers the self-oscillation involves the aerial circuit. Radiation then takes place and the heterodyne note is

heard on receivers connected to neighbouring aërials. This interference trouble caused by the faulty adjustment of listeners' receivers is known as "oscillation," and spoils the clear reception of many programmes.

29. *Future Progress*.—An enormous field of development lies ahead. Navigation by sea and air will be aided by the installation of rotating wireless beams which signal a different code for each point of the compass; by special beacon stations automatically transmitting known code signals on reserved wave-lengths for direction-finding purposes; and by the use on board ship of automatic call devices for S.O.S. signals.

Point to point wireless telegraph communications for economic and interference reasons are likely to be established to a rapidly increasing extent by short wave beams, transmission on alternative wave-lengths being provided if propagation absorption conditions make this necessary.

Automatic operating speeds up to 2,000 words per min. if called for can be achieved, and if traffic becomes heavy enough multiplex transmission by applying different modulating frequencies to the same carrier wave may be employed.

It is expected that the British Post Office trans-Atlantic wireless telephone service will be operating commercially within a year or so.

Transmission of line drawings and photographs and whole pages of messages by wireless is already an accomplished fact, and is being adapted for commercial use to trans-Atlantic circuits by the Radio Corporation of America working in conjunction with the Marconi Company.

The invaluable aid that a popular broadcast service, comprising distributed transmitting stations under a centralised control, can render a Government at a time of national emergency, was effectively demonstrated in Great Britain during the General Strike of 1926, and the experience then gained is likely to influence future broadcast regulations.

Finally reference may be made to wireless television, which is still (in 1926) in the laboratory stage, and must take several years to develop; but when mature will prove to be a very useful and popular extension of the art of broadcasting and radio transmission in general.

(G. MAR.; H. M. D.)

**WIRTH, KARL JOSEPH** (1879— ), German statesman, was born at Freiburg, Baden, Sept. 6 1879. Educated at Freiburg University, in 1908 he was appointed professor of natural science at the technical college in Freiburg, being shortly afterwards elected to the municipal council of that city. In 1913 he obtained a seat in the diet of Baden and the following year became a member of the Reichstag. In 1918 he was appointed Minister of Finance for Baden and in 1919 was elected a member of the Constituent Assembly of the Reich. In March 1920 he was given the portfolio of Finance, which he continued to hold until Feb. 1922. In May 1921 he was called upon to form a new ministry, on the occasion of the Allied ultimatum regarding reparations. In Aug. and Sept. of that year he came into conflict with Von Kahr, the Bavarian Premier, who refused to apply to Bavaria the state of national emergency which Wirth had proclaimed consequent on the murder of Rathenau. Wirth stood his ground, and Von Kahr was compelled to resign, but two months later the decision of the League of Nations on the partition of Upper Silesia between Germany and Poland led to Wirth's own resignation. No one was found capable of taking his place, however, and he resumed office on Oct. 26. In Nov. 1922, owing largely to party dissensions, Wirth again resigned, and Dr. Cuno, manager of the Hamburg-America Line, was entrusted with the formation of a new ministry.

**WISCONSIN** (see 28.740), a State of the United States of America. The population in 1920 was 2,632,067, as compared with 2,333,860 in 1910, an increase of 298,207, or 12%. The density of population in 1920 was 47.6 per sq. m.; in 1910 it was 42.2. The proportion of urban population increased from 43% in 1910 to 47.3% in 1920. The following table shows the population in 1920 of the principal cities.

|                 |         |                 |        |
|-----------------|---------|-----------------|--------|
| Milwaukee . . . | 457,147 | Madison . . .   | 38,378 |
| Racine . . .    | 58,593  | Oshkosh . . .   | 33,162 |
| Kenosha . . .   | 40,472  | Green Bay . . . | 31,017 |
| Superior . . .  | 39,671  | Sheboygan . . . | 30,935 |

**Government.**—A constitutional amendment in 1912 regulated the borrowing capacity of cities and incorporated villages; another of the same year gave the State Government power to create a park system. Amendments in 1911 and 1912 regulated the pay of judges; and one of 1922 related to trial by jury. A law of 1915 allowed absentee voting, and one of 1918 voting by soldiers. Commissions play an important part in the government. The following have been created since 1905: accountancy (1913), compensation insurance (1917), conservation (1915), engineering department (1915), grain and warehouse (1905), health (reorganised 1913), highways (1911), industrial (1911), and marketing (1923), besides boards of examination for licences for architects, boxers, barbers, plumbers, etc. and *ex-officio* boards. A workmen's compensation law for the state was passed in 1911. A law of 1917 provided for the sterilisation of defectives, and laws of 1913, 1915 and 1917, for the ante-nuptial physical examination of men.

**History.**—The progressive policy inaugurated by Governor La Follette was continued by his successors, governors Davidson and McGovern. In 1914 there was a political reaction which resulted in the election of Emanuel Phillip, but the governmental policy underwent but slight change. The State was strongly divided in 1917 on the question of the entry of the United States into the World War; Senator La Follette opposing such action, and Senator Hustung favouring it. The death of the latter in 1918 resulted in the election of Irving L. Lenroot (Rep.): he was re-elected in 1920. In 1920 John J. Blaine, supporter of the views of Senator La Follette, was elected governor in succession to Emanuel Phillip. He was re-elected in 1922, and in 1924.

**Agriculture.**—The total land area in cultivation in 1910 was 21,060,000 ac. of which 11,908,000 was improved; in 1925 it was 21,851,733, of which 13,666,709 was improved. The value of farm property in 1910 was \$1,413,118,785, and in 1920 it was \$2,677,282,997. The following table shows the quantities and values of the chief crops in 1920 and 1925:—

|        | 1920         |              | 1925         |              |
|--------|--------------|--------------|--------------|--------------|
|        | Quantity Bu. | Value        | Quantity Bu. | Value        |
| Corn   | 44,547,398   | \$64,593,729 | 99,556,000   | \$71,680,000 |
| Oats   | 68,296,223   | 58,051,788   | 126,246,000  | 47,973,000   |
| Wheat  | 7,328,444    | 16,489,016   | 5,196,000    | 3,284,000    |
| Barley | 12,191,861   | 16,459,014   | 16,965,000   | 11,197,000   |

The total value of cereal production in 1910 was \$73,141,919; in 1920 it was \$170,196,910. Livestock on farms in 1925 consisted of 626,000 horses and mules, 5,050,000 cattle, 351,000 sheep and 1,580,000 swine.

**Manufactures.**—Manufactures and agriculture are closely balanced in their importance to the state. In 1920, 308,038 persons were listed as engaged in agriculture, and 339,578 in manufacturing. The value added to materials by manufacturing in 1914 was estimated at \$277,756,928; in 1921, at \$486,919,679. The greatest increase in the output of manufactured products was in the region of Lake Michigan. Water-power resources have been partially developed, and are used chiefly for lighting and transportation purposes. The most important manufactures are of farm products.

The following tables give details of the manufacturing industries of the State:—

|                                     | 1909         | 1919          | 1923          |
|-------------------------------------|--------------|---------------|---------------|
| Total No. industrial establishments | 9,721        | 10,393        | 7,832         |
| Wage earners, average number        | 182,583      | 263,949       | 247,851       |
| Wages                               | \$93,904,808 | \$290,440,561 | \$297,160,064 |
| Cost of material                    | 346,356,583  | 1,127,274,961 | 1,001,501,870 |
| Total value of products             | 590,305,538  | 1,846,984,307 | 1,720,198,349 |

|                                               |              |               |
|-----------------------------------------------|--------------|---------------|
| Butter, Cheese, Condensed milk                | \$56,642,000 | \$221,447,000 |
| Cheese                                        | 91,463,000   |               |
| Condensed milk                                | 73,342,000   |               |
| Foundry and machine shop products             |              | 198,644,000   |
| Automobiles, including bodies and parts       |              | 119,381,000   |
| Slaughtering and meat packing                 |              | 104,201,000   |

| Electrical machinery and supplies             |              | 23,636,000    |

**Natural Resources.**—The following table shows the development in the value of mineral production from 1909–19:—

|               | 1909        | 1919        |
|---------------|-------------|-------------|
| Iron ore      | \$2,972,584 | \$3,826,872 |
| Lead and zinc | 1,989,907   | 3,816,911   |
| Granite       | 1,433,105   | 1,484,979   |
| Lime stone    | 842,116     | 1,107,790   |
| Sand stone    | 200,236     | 231,078     |
| All other     | 21,456      | 113,203     |

In 1904 Wisconsin stood first among the States in lumber products; in 1922, fourteenth. In 1925 the development of forest reserves and fire protection were helping to stabilise the lumber industry. The earliest Wisconsin industry, the fur trade, pro-

duced goods to a value of \$669,005.20 in 1918. The development of the fisheries included the establishment of new hatcheries at Spooner for pike, at Sturgeon Bay for white fish, and at Sheboygan for blue fin. The commercial fishing was mostly in the Great Lakes, but this was less important than the sport fishing under licence in the rivers and streams.

**Transportation and Commerce.**—The steam railway mileage in 1924 was 7,657, and the mileage for electric railways, 989. An interurban electric system covers the southeastern portion of the state. The highway system has been widely developed with the assistance of Federal and State aid, and in 1925 the State trunk highways totalled 10,257 m. in length. This has been followed by an extensive development of lines laid to carry busses and trucks.

**Finance.**—State finance is managed under a budget system with certain continuing appropriations, and an *ex-officio* commission has power to make emergency grants. In 1922, \$19,784,872 was raised for State purposes. In 1922, \$22,265,693 was raised for county purposes, and \$43,506,660 for local purposes. This included proceeds from the state income tax, \$12,661,352 in 1921, most of which is turned over to localities in lieu of a personal property tax.

**Education.**—A state board created in 1915, with powers modified in 1917, correlates the educational undertakings of the state. In 1915 a board was created to provide vocational instruction; in 1920, 32 cities provided for continuation schools. The total expenditure for public schools in 1921 was \$50,385,853, of which over \$30,000,000 was raised by school taxes.

**BIBLIOGRAPHY.**—H. C. Campbell, etc., *Wisconsin in Three Centuries*, 4 vol. (1905); E. B. Usher, *Wisconsin, Its Story and Biography*, 8 vol. (1914); F. C. Howe, *Wisconsin, an Experiment in Democracy* (1912); C. McCarthy, *The Wisconsin Idea* (1912); J. B. Winslow, *The Story of a Great Court* (1912); F. Merk, *Economic History of Wisconsin in the Civil War Decade* (1916). (C. R. F.)

**WISTER, OWEN** (1860– ), American writer, was born in Philadelphia July 14 1860. On graduating from Harvard in 1882 he intended to devote himself to music. He went abroad for study; but family reasons forced him to return, and he spent several years in Arizona and New Mexico. He then entered the Harvard law school, graduating in 1888, was admitted to the Bar in 1889 and for two years practised in Philadelphia. Thereafter he devoted his time to literary work. His novels, *The Virginian* (1902) and *Lady Baltimore* (1906) in particular, established his position as one of the foremost American writers of his generation and won for him a wide popularity.

Wister's other publications include the *Modern Swiss Family Robinson* (1883); *The Dragon of Wanley: His Tail* (1892); *Lin McLean* (1898); *U. S. Grant, a Biography* (1900); *Philosophy 4: a Story of Harvard University* (1903); *The Seven Ages of Washington: a Biography* (1907); *Members of the Family* (1911); *The Pentecost of Calamity* (1915); *A Straight Deal: or the Ancient Grudge* (1920); *Neighbours Henceforth* (1922); and *Watch Your Thirst* (1923).

**WOLSELEY, GARNET JOSEPH WOLSELEY**, VISCOUNT (1833–1913), British soldier (see 28.777), died at Mentone March 25 1913, the title going by special remainder to his only daughter, Frances. He was buried in St. Paul's Cathedral, and an equestrian statue of him on the Horse Guards' Parade, Whitehall, London, was unveiled in 1920.

**WOLVERHAMPTON, HENRY HARTLEY FOWLER**, 1ST VISCOUNT (1830–1911), British statesman (see 28.781), died at Woodthorne, Wolverhampton, Feb. 25 1911.

**WOMEN, DISEASES OF** (see GYNAECOLGY, 12.764).—During recent years gynaecology has advanced chiefly in the direction of greatly improved operative technique, and in the application of radiological methods. Papers have been published on various points, particularly on the functions of the ovary and the ductless glands, but no experimental work of outstanding importance has appeared and most of the publications are clinical.

At puberty the uterus and ovaries begin to undergo each month a complex and correlated series of changes, which continues throughout the whole reproductive period of a woman's life, normally is arrested only by pregnancy and lactation and ends at the menopause. Its double purpose is to liberate an ovum from

the ovary and prepare the endometrium for its reception if fertilised. The cycle of change in the endometrium is concerned with the renewal of the so-called menstrual decidua. If fertilisation occurs, the ovum becomes embedded in the prepared endometrium where it develops into a child, and further menstruation is arrested. If fertilisation does not occur, the menstrual decidua is cast off and the cycle of changes in the uterus and ovaries is repeated. The menstrual flow recurs about every 28 days, lasts about five days, and consists of a discharge from the uterus of 4 to 6 ounces of non-coagulate blood with fragments of decidua and mucus from the cervical glands. The complete cycle in the endometrium thus consists of alternate phases of building up and breaking down initiated by ovulation, for if the ovaries are removed the endometrium remains permanently in the resting phase. During ovulation an ovarian follicle ripens and ruptures, liberating an ovum; at the site of rupture a temporary yellow body (*corpus luteum*) forms, and recent work has shown that the internal secretion of this body provides the chemical stimulus to the uterine cycle. The time-relationship between the events in the ovarian and uterine cycles is as follows: the ovarian follicle ruptures about 14 days before the onset of the menstrual flow, the *corpus luteum* reaches its full development about seven days before the flow, and begins to decline after the flow has begun.

**Common Disorders.**—The usual disorders of menstruation are: (1) amenorrhoea (absence of flow), (2) menorrhagia (excessive flow), (3) too frequent, irregular or scanty flow, (4) dysmenorrhoea (painful flow). Amenorrhoea may be physiological (pregnancy, lactation, menopause). Delay in initial onset may depend upon developmental error in the uterus or vagina. Pathological amenorrhoea may be due to error in growth or development or to constitutional disease. Thus menstruation may occur, but escape of the fluid be prevented by presence of a membrane obstructing the vaginal orifice ("imperforate hymen") or by the absence of the vagina or imperforation of the cervix uteri (concealed menstruation)—or the uterus may fail to develop beyond the infantile state or may be completely absent and in the latter case the amenorrhoea is permanent. Amongst constitutional causes are chlorosis, secondary anaemia, tuberculosis, mental shock and strain, acute illness and defective function of the thyroid or pituitary glands; in most of these the amenorrhoea is usually temporary.

**Menorrhagia.**—This signifies excessive bleeding at the time of the menstrual flow, but no irregular bleeding during the interval. Amongst uterine causes are fibromyoma, polypi, excessive thickness of the endometrium, fibrosis and chronic sub-involution and inflammation of the Fallopian tubes; general causes are, (a) diseases associated with plethora, e.g., chronic cardio-vascular disease, chronic renal disease, (b) primary blood diseases, e.g., pernicious anaemia, leukaemia, purpura and haemophilia, (c) endocrinous diseases, especially hyperthyroidism; (d) at puberty and menopause there may be, for a time, excessive menstrual haemorrhage; but haemorrhage at the menopause is often associated with a new growth of the uterus. Irregular haemorrhage independent of menstruation always indicates uterine disease. After the age of 30, and especially after the menopause, it suggests cancer of the uterus. Irregular haemorrhage during early pregnancy usually means either threatened abortion or extra-uterine gestation. Treatment demands careful diagnosis. Amongst drugs which relieve certain forms of haemorrhage are ergot, pituitary extract, calcium salts and parathyroid gland. Too frequent or irregular menstruation is common and, if not profuse, is unimportant; since the ovary is the "pacemaker" of the uterus in menstruation, the cause probably lies in irregular ovulation.

**Dysmenorrhoea.**—The varieties of dysmenorrhoea are (a) spasmodic, (b) congestive. *Spasmodic dysmenorrhoea* is due to painful contractions of the uterus beginning with onset of the flow and lasting a few hours or a day; the pain is believed to be associated with the shedding of the menstrual decidua and the entire membrane can often be discovered in the discharge. Usually no uterine abnormality can be detected. The treatment consists of rest,

hot baths and such anti-spasmodic drugs as phenazone, phenacetin, aspirin, atropine. If this fails dilatation of the cervix often cures. Cases which arise in later life are usually due to a submucous fibromyoma of the uterus.

**Congestive Dysmenorrhoea.**—This condition is a severe aching which begins about a week before, and is relieved by, the flow; it is due to chronic inflammatory disease of the Fallopian tubes or of the uterus, or to uterine fibromyoma.

#### INFECTIONS OF THE REPRODUCTIVE ORGANS

About 60% of infections are puerperal, about 20% are gonorrhoeal, and the remainder are fortuitous infections, often secondary to a primary focus elsewhere, such as in the bowel (appendicitis, diverticulitis), the tonsils or the teeth; about two per cent are due to the tubercle bacillus. In most puerperal infections, and in all gonorrhoeal, the infection ascends from the vulva, vagina or cervix uteri to the uterus, Fallopian tubes and peritoneum. In other cases the bacteria are carried to the organs by the blood stream (*haematogenous infection*). The infection may remain localised to the various parts of the generative system or invade the blood stream, producing the very grave condition of septicaemia. Usually, especially in puerperal and gonorrhoeal infections, the condition is widespread. Syphilitic infection of the reproductive organs is considered elsewhere.

#### DISEASES OF THE EXTERNAL GENITAL ORGANS

The vulva comprises several structures grouped together for convenience of description.

**Types of Affections.**—(1) Injuries occurring during parturition, or accidental; the commonest is rupture of the perineum. (2) Inflammation (*vulvitis*). Simple vulvitis is due to want of cleanliness or to irritating discharges, and in children may result from threadworms. Severe infective vulvitis is usually due to gonorrhoea. The symptoms are heat, itching and throbbing, and the parts are red, swollen and bathed with discharge. In the gonorrhoeal variety local inflammation is very severe, the discharge profuse and purulent and there is scalding pain on micturition. The treatment of simple vulvitis is rest in bed, cleanliness and bathing the vulva with warm, antiseptic lotions. Gonorrhoeal vulvitis is almost invariably associated with infection of the urethra, vagina and cervix; the treatment, which is prolonged and requires an expert, consists chiefly in the precise application of a special antiseptic, such as two per cent acriflavine, to the sites of infection. (3) Cutaneous infections, the most important of which are eczema, erythema, herpes, furunculosis, tubercle, elephantiasis, leucoplakia and kraurosis. These affections present the same characters as in other parts of the body. In leucoplakia the surface of the vulva becomes thickened and covered with white patches, and later cracks and ulcers appear; the disease is important because it is often the forerunner of cancer. (4) Tumours. Any part of the vulva may be the seat of new growths, simple or malignant; cysts of Bartholin's gland and vascular *caruncles* of the urethral orifice are the commonest. *Pruritus* of the vulva (persistent itching) is a symptom more than a disease, and accompanies vulvitis and most of the conditions given above under (4), as well as diabetes and cancer.

#### DISEASES OF THE VAGINA

The vaginal walls are kept moist by a thin, acid, opalescent fluid containing desquamated epithelium and cervical mucus; when excessive the condition of *leucorrhoea* results.

**Malformation.**—The vagina may be absent in whole or in part, or may present a longitudinal septum. Occlusion of the lower end by a membrane prevents escape of the menses and leads to gradual distension of the vagina with blood ("haematocolpos").

**Prolapse.**—This is a hernial protrusion of the pelvic contents, e.g., bladder, rectum, through the opening in the pelvic floor muscles, the vaginal walls forming the covering of the protrusion; there is usually concomitant prolapse of the uterus. Vaginal prolapse can be permanently cured by operation; the palliative treatment is by vaginal pessaries.

**Fistulae.**—These may form between the vagina and bladder, or vagina and rectum. They are usually the result of parturition or malignant disease.

**Vaginitis.**—(a) Simple catarrhal vaginitis is due to the same causes as simple vulvitis; occasionally in children it is important from a medico-legal aspect. (b) In gonorrhoea the vagina is infected together with the vulva, urethra and cervix; the vaginal walls are intensely red and covered with profuse yellow discharge. (c) Chronic vaginitis may follow the acute variety and may persist for a long time. The vagina is rarely the seat of tumours, but cysts are not uncommon.

#### DISEASES OF THE UTERUS

**Errors in Growth and Development.**—The organ may be congenitally absent, may remain in the infantile state, or may fail to reach full maturity; these conditions cause amenorrhoea, scanty menstruation, dysmenorrhoea or sterility. It may also be completely or partially double.

**Displacements.**—Normally the uterus is bent forwards (ante-flexion) and turned forwards (anteversion). The chief displacements are prolapse and retroflexion. In early prolapse the uterus remains within the vagina; later the cervix lies outside the vulva and the vagina is completely inverted (procidencia). The symptoms are a "bearing down" feeling, great discomfort and fatigue on walking and interference with micturition and defaecation. Prolapse is very rarely met with in nulliparae, and its essential cause is stretching and injury of the fasciae and muscles of the pelvic floor owing to parturition; an inborn tendency doubtless exists in some women, but in many cases too hasty delivery of the child by midwifery forceps is blameable. The palliative treatment is by vaginal pessaries; but cure by operation is far preferable. The modern operation consists of a plastic repair of the pelvic floor, vaginal vault and perineum. Retroflexion is always combined with retroversion (rotation backwards through a transverse axis); it may be congenital, but is nearly always acquired as the result of childbirth or abortion or of pelvic inflammation. There is much difference of opinion concerning the symptoms and effects of retroflexion and the indications and methods of treatment. If the displaced uterus is healthy, and not fixed by adhesions, it is, with the occasional exceptions of dyspareunia and sterility, symptomless and harmless, and requires no treatment. But when it is the subject of chronic inflammation or subinvolution and is fixed by adhesions, it requires treatment for the relief of associated symptoms. Palliative treatment is by replacement and the insertion of a pessary, which is only possible when the uterus is not fixed. Curative treatment consists in suspending the body of the uterus to the anterior abdominal wall.

**Inversion.**—Inversion of the uterus is possible only when the cavity is dilated, either after pregnancy or by a tumour. Most cases are acute, follow immediately on delivery and are accompanied by much shock and haemorrhage and a very high mortality. Chronic inversion either results from the acute variety in untreated patients who have survived, or is due to the gradual traction of a fundal intrauterine tumour (usually a fibroid polypus). The symptoms of chronic inversion are haemorrhage and bladder troubles, and on examination a swelling is found in the vagina. Reduction of the condition is often difficult, particularly when it has lasted for a long time.

**Inflammation.**—This may affect the cervix or the body of the uterus, and may be acute or chronic. Most cases are due to infection at labour or to gonorrhoea. A secondary infection by the bloodstream, especially by streptococci, may occur from a primary focus elsewhere. Pessaries in the vagina may cause infection, especially if not kept clean by douching and removed at intervals. Chronic inflammation of the cervix (cervicitis) is predisposed to by unhealed tears resulting from labour, is commonly associated with a red congested annular patch of glandular mucous membrane (erosion) and has a muco-purulent discharge as its chief symptom. In acute cervicitis the part is red and swollen, and a discharge of pus, in which the infecting germ may be discovered, pours from the cervical canal. Its danger is upward spread of the infection to the uterus, Fallopian tubes and peritoneum. The

treatment of acute infection is rest in bed, vaginal douches and the application of strong antiseptics to the cervical canal. Chronic infections may be cured by the direct application of antiseptics and in cases associated with unhealed tears and erosion, by excision of the diseased portion. Inflammation of the body of the uterus, usually the result of puerperal or of gonorrhoeal infection, affects chiefly the lining membrane or endometrium (*endometritis*). Acute puerperal endometritis is a very serious condition, due usually to streptococcal infection, and liable to spread to the tubes, peritoneum or blood stream (*septicaemia*). Gonorrhoeal endometritis is always secondary to infection of the cervix; it is serious as infection of the Fallopian tubes may follow.

Chronic endometritis may be either interstitial or glandular, and results from bacterial infection. The chief types of interstitial endometritis are senile and tuberculous. Senile endometritis affects women after the menopause and causes a foul-smelling discharge, sometimes blood-stained; if the discharge cannot escape the uterus becomes distended with pus (*pyometra*). Tuberculous endometritis is extremely rare and is usually due to spread from the tubes. Chronic glandular endometritis is characterised by very great thickening of the endometrium due to proliferation of the glands; the symptom is profuse menorrhagia, and relief can be obtained only by curetting. Inflammation of the whole uterus (metritis) if acute, is nearly always the result of puerperal infection, and the symptoms and complications are similar to those of acute puerperal endometritis. Chronic metritis is the sequel to the acute variety or to puerperal subinvolution; the uterus is enlarged and fibrous, and the chief symptom is menorrhagia. The menorrhagia, in this case, cannot be cured by curetting, because the endometrium is not thickened; the intrauterine application of radium, however, acts like a charm.

#### NEW GROWTHS

**Non-Malignant.**—The uterus is the commonest seat of new growths. The innocent new growths comprise adenoma, fibromyoma, adenomyoma and polypi of various kinds; the malignant are carcinoma, sarcoma and chorionepithelioma. Adenomata usually become polypoid, and occur both in the body and cervix; their symptom is uterine haemorrhage and their treatment is surgical. Fibromyomata or "fibroids" occur especially in women between the ages of 35 and 50. They are believed to affect about 25% of women over 35 years of age, but commonly are small and cause no symptoms. It is doubtful if they ever originate after the menopause. They are solid, round or ovoid tumours, usually multiple, sometimes becoming enormous, and composed of a mixture of fibrous and muscular tissue. According to their position in the uterine wall they are divided into intramural, subperitoneal and submucous. The two latter may assume a polypoid form. Submucous fibroids and, to a less extent, intramural fibroids, give rise to severe menorrhagia and may lead to dangerous anaemia. At the menopause they share in the general atrophy of the uterus and may almost disappear. Secondary changes are common and include calcification, mucoid degeneration, cyst-formation, fatty changes, necrobiosis (red degeneration), septic infection (sloughing fibroid), and sarcomatous change.

The modes in which fibroids imperil life are haemorrhage, septic infection, impaction, twisting of the pedicle by rotation and intestinal and urethral obstruction. During pregnancy they share in the growth of the uterus; but interference with pregnancy, such as abortion, is not common. If growing from the cervix or lower part of the uterus they may obstruct labour and necessitate Caesarean Section. Small symptomless fibromyomata, often discovered by accident, require no treatment, but should be watched. Fibromyomata of a certain size, or causing symptoms, require either hysterectomy (removal of the uterus) or myomectomy (removing the tumour and leaving the uterus). Hysterectomy is the easier, and usually the safer, operation; myomectomy is preferable when the patient is young and it is desired to preserve the function of child bearing. Treatment by drugs or by electrical currents is, rightly, a thing of the past, but X-rays and radium have an important place. The insertion of radium into the uterus is the ideal treatment for menorrhagia due to small submucous

fibroids, but is not suitable for tumours of any size. Haemorrhage from fibroids often ceases after several applications of X-rays; but this treatment is too uncertain in its action seriously to compete with surgery.

**Malignant New Growths.**—The varieties of malignant disease met with in the uterus are carcinoma, sarcoma and chorion-epithelioma malignum. The age at which women are most subject to carcinoma of the uterus is towards the decline of sexual life. Of 3,385 collected cases of cancer of the uterus 1,169 occurred between 40 and 50, and 856 between 50 and 60. In contradistinction to fibroid tumours it frequently arises after the menopause. It may be divided into cancer of the body and cancer of the neck (cervix). Cancer of the cervix is almost exclusively confined to women who have been pregnant. Predisposing causes are tears of the cervix, erosion and chronic cervicitis. The symptoms which induce women to seek medical aid are haemorrhage, foetid discharge and, later, pain and cachexia. An unfortunate belief amongst the public that the menopause is associated with irregular bleeding and offensive discharges has prevented many women from seeking medical advice until too late. It cannot be too widely understood that cancer of the cervix is in its early stages a purely local disease, and that removal in this stage usually results in cure. The modern operation is that perfected by the late Professor Wertheim of Vienna, and consists in removal of the whole uterus, upper third of the vagina and as much of the surrounding tissues as possible. The operation is severe, but freedom from recurrence may be expected in 30% of early cases.

Preoperative treatment by radium is usually advisable. In advanced cases treatment by radium and X-rays may be relied upon to palliate, if not to cure. Cancer of the body of the uterus is rare before the 45th year and is most frequent subsequent to the menopause. The majority of the patients are nulliparae and may be the subjects of fibroids. Hysterectomy is the only treatment. Chorion-epithelioma is a malignant disease presenting microscopic characters resembling the cells of the chorionic epithelium. It occurs in connection with recent pregnancy and particularly with the variety of abortion termed hydatidiform mole. It quickly ulcerates and infiltrates the uterine tissues, forming metastatic growths in the lung and vagina. In many cases it destroys life with a rapidity unequalled by any other type of growth. Clinically it is recognised by the occurrence after pregnancy of violent haemorrhages and progressive cachexia. The growth is usually primary in the uterus but may be so in the Fallopian tubes and in the vagina. A few cases have been recorded unconnected with pregnancy. Immediate and wide removal of the affected organ is the only treatment. Sarcoma of the uterus may occur in the body and in the cervix, occurs at an earlier age than carcinoma and may originate either in the wall or endometrium of the healthy uterus, or as a secondary change in a fibromyoma. Uterine enlargement and haemorrhage are the symptoms. The differential diagnosis is microscopic. Hysterectomy is the only chance of prolonging life.

#### DISEASES OF THE FALLOPIAN TUBES

The Fallopian tubes or oviducts are liable to septic infection (acute and chronic *salpingitis*), tuberculosis, innocent and malignant new growths and tubal pregnancy. Salpingitis is nearly always secondary to septic infection of the genital tract following labour or abortion, gonorrhoea, infected fibromyoma and cancer of the uterus. The right tube may be affected by appendicitis. In some cases the infection of the tubes appears to be accidental, probably the result of an infective focus elsewhere, such as the tonsils or respiratory tract. When the pus escapes from the tubes into the peritoneal cavity it sets up local or general peritonitis. Even mild cases of salpingitis result in gluing together of the fimbriae and sealing of the ostium (the abdominal opening or mouth of the tube) and matting together of the tube and ovary by peritoneal adhesions. If the inflammation continues after the ostium is sealed, fluid accumulates in the tube (*pyosalpinx*, *hydrosalpinx*). Distension of the tube with blood (*haematosalpinx*) is nearly always due to tubal pregnancy. Acute salpingitis is a very severe illness, and is accompanied by high temperature, ab-

dominal pain and tenderness and much constitutional disturbance. The symptoms may become merged in those of general peritonitis. In chronic salpingitis there is a history of puerperal infection or gonorrhoea, followed by chronic pelvic pain, profuse menstruation and sterility; on examination the enlarged tubes may be felt. Acute salpingitis requires rest in bed in a propped up posture, sedatives, hot fomentations and skilled nursing. Urgent symptoms and signs of spreading peritonitis may call for operative interference, chiefly for the purpose of peritoneal drainage. Chronic salpingitis, or pyosalpinx, renders a woman an invalid and permanent relief can only be afforded by surgery. Tuberculous salpingitis is usually secondary to tuberculous infection in other parts, such as the lungs or peritoneum. The Fallopian tubes may be the seat of malignant disease; this is rarely primary but usually an extension of cancer of the uterus or ovaries.

In *tubal pregnancy* the fertilised ovum becomes embedded in the tube instead of in the uterus. The chief cause of this abnormality is kinking and adhesion of the tube is the result of former salpingitis, and this state of the tube is found in 75% of cases of tubal pregnancy. The tubal ovum has a precarious existence, because of the eroding action of the villi surrounding it upon the thin tubal wall. Either the ovum becomes separated and surrounded by blood, and in consequence dies, forming a *tubal mole*; or, the eroding villi perforate the tubal wall, resulting in rupture of the tube and profuse intraperitoneal haemorrhage.

After the formation of a tubal mole the tube undergoes spasmodic contractions and attempts to expel the mole through the ostium; this process (*tubal abortion*) is accompanied by violent attacks of pain and the escape of blood into the peritoneal cavity. The bleeding is usually localised by adhesions and forms beside the tube a swelling of varying size (*pelvic haematocoele*). Tubal pregnancy usually comes to an end at about the 6th week. Rarely the ovum continues to develop after rupture of the tube and may even continue to full-term, the placenta gaining attachment to the pelvic or abdominal structures. The uterus undergoes slight enlargement and always develops a decidua which is expelled when the pregnancy is disturbed. The signs of tubal pregnancy before rupture are amenorrhoea, pelvic pain and the presence of an enlarged tube. When rupture occurs there is sudden and severe pain with great shock and collapse, and the haemorrhage is usually so severe as to imperil life. The more common event is, fortunately, mole formation with tubal abortion and production of a haematocoele; the symptoms of this are spasmodic attacks of severe pain and irregular uterine haemorrhage and, sometimes, the passage of a decidual cast from the uterus; on examination the haematocoele is felt as a swelling in the pelvis. In all forms the only treatment is abdominal section and removal of the affected tube. In those rare cases in which the placenta and foetus continue to develop until full-term, the child may be removed alive by abdominal section but is often deformed and rarely survives for long. If the foetus die it may become the seat of calcification (*lithopaedion*) and be retained within the abdomen indefinitely.

#### DISEASES OF THE OVARIES AND PAROVARIUM

Congenital absence of the ovaries, except in association with some foetal monstrosity, is unknown. Prolapse or descent from its normal position into the pouch of Douglas, is usually associated with backward displacement of the uterus or salpingitis and pyosalpinx but it may occur from elongation of the utero-ovarian ligament. A prolapsed ovary is tender and painful and is one cause of dyspareunia. Inflammation (oöphoritis) is commonly dependent on infection of the tubes or peritoneum or, on the right side, on appendicitis; but the tuberculous variety may be primary. The causes of oöphoritis are the same as those of salpingitis. If the condition becomes chronic the capsule is thickened, the follicles cannot rupture and the ovary becomes converted into a collection of tiny follicular cysts (*small cystic or cirrhotic ovary*); ovarian tumours (generally cystic) are common. The two commonest are the multilocular *pseudomucinous adenomatous cyst*, which may arise at almost any age and attain an enormous size, and the unilocular *epoöphoric cyst* which arises

from the tubules in the hilum of the ovary; both are innocent and occasionally bilateral. The so-called *dermoid cyst*, really a teratoma, along with sebaceous material, may contain bone, teeth, hairs, skin and many other tissues. The *papillomatous cyst* may be semi-malignant and often gives rise to secondary implantations on the peritoneum; it is usually bilateral. *Broad ligament cysts* are unilocular and may reach a large size; they originate from the rudimentary Wolfian tubules. "Chocolate" or "tarry cysts" arise from implanted endometrium (endometrioma); they are usually bilateral and are associated with dysmenorrhoea and sterility. Ovarian cysts seldom cause pronounced symptoms but are liable to such grave complications as torsion of the pedicle, rupture and suppuration; they are all liable to undergo malignant change. *Fibroma* is the commonest innocent solid tumour. Malignant disease (carcinoma and sarcoma) may be primary, or more commonly, secondary to cancer of the gastrointestinal tract or breast. The treatment of all varieties of ovarian tumour is removal by operation as soon as possible.

#### DISEASES OF THE PELVIC PERITONEUM

Nearly all of these infections result from childbirth or abortion or from gonorrhoea and become localised to the pelvic part of the peritoneal cavity. Pelvic peritonitis or perimetritis may proceed to abscess formation, the most common situation being the pouch of Douglas; from thence the abscess may either burst into the rectum or the bladder. Even if pelvic peritonitis resolves without abscess-formation it always leaves adhesions, of greater or less extent, between the uterus, tubes, ovaries and adjacent coils of intestine, resulting in abnormal position of the pelvic organs, sterility, dysmenorrhoea and other pelvic pain. General peritonitis of genital origin is comparatively rare; it may follow puerperal infection, but seldom, if ever, is the result of gonorrhoea. *Hydro-peritoneum*, a collection of free fluid in the peritoneal cavity, may be due to many general causes but also to papillomatous or cancerous ovarian tumours.

**Connective Tissues.**—*Pelvic cellulitis* or *parametritis*, a septic inflammation of the pelvic cellular tissue, chiefly at the bases of the broad ligaments, is usually preceded by labour, especially if difficult or instrumental and accompanied by tears of the cervix uteri. The symptoms are rigours, rise of pulse-rate and intrapelvic pain, with tenderness and swelling on one or both sides of the pelvis beside the uterus, which becomes fixed in the exudate as if embedded in plaster of Paris. The inflammation may undergo resolution if appropriately treated or may go on to suppuration, forming an extraperitoneal abscess which may point in the vagina, rectum or bladder and occasionally in the groin. If the pus can be localised an incision should be made and the abscess drained.

**WOMEN, EDUCATION OF.**—"The growing demand for higher education" referred to in the article on Education (*q.v.*) has been most marked in the sphere of women's education. On both sides of the Atlantic this movement has caused a great deal of pressure on the existing schools for girls and colleges for women.

#### I. IN GREAT BRITAIN

As regards England and Wales the report of the Board of Education for 1923-4 states that in grant-aided secondary schools there were in 1910 72,447 girls; in 1924 171,176. Schools generally are larger than they were. In 1909 361 girls went to the universities; in 1921 the corresponding figure was 1,214.

The reform movement in women's education began about 1850. Colleges came first, then high schools, and between 1875 and 1900 these developed, though under financial stress and many limitations. The local education authorities, under the Act of 1902, established new schools and took over, transformed or aided existing ones. The Board of Education grant and regulations from 1904 unified and encouraged growth, while the foundation of the civic universities widened opportunity for women more even than for men. All this reform justified itself

during the War; it had made possible the extraordinary contribution of women to national service.

Simultaneously women, hitherto supported by their families, became self-supporting, owing either to choice or to need; parents, who had never desired secondary or university education for their daughters, learnt its value. Hence the pressure felt most seriously at the colleges for women at Oxford and Cambridge. Hostels at civic universities are thronged also. No demand appears for any general change in the existing plans of work or of life, though greater freedom and variety for individuals is urgently claimed, and the competition and overpressure to enter are strongly deprecated.

The outstanding characteristics of the movement since 1911 are unity and standardisation among schools, and the development of boarding schools. Two forces caused the former. The first is the action of the Board of Education, which acts, not only through grants, regulations and inspections, but through examination schemes. The state has never made any difference between boys and girls in education; the same grants are paid, the same state scholarships offered, the same standards required. Women appreciate this equality, but they demand freedom for the individual, a longer time of preparation for examinations, and the wider recognition of music and art.

The second force, more vague but as effective, is the spread of the tradition formed in the older schools into the new council schools. That tradition was itself derived from the best ideals of English colleges and public schools. The new secondary schools for girls were staffed by women themselves true to such traditions. Head mistresses often fought hard to establish and maintain this tradition against that derived from earlier and meaner forms of public elementary education and they generally succeeded. Today there are council schools with fine buildings, good tone, and high intellectual standards of which the country may be proud.

The free place system has made little difference to the high schools for girls. Free and fee-paying pupils blend and share social life and self-government. The system may be responsible for the increased popularity of the new boarding school. The boarding school has always suited certain English families who send their boys to the public schools. This new type has attractions; games, college women as mistresses, marked physical care and comfort, kindly methods of discipline, intellectual standards of work. The initiative for this type was made at St. Andrews by Miss Lumsden and Miss Dove in 1885. New boarding schools have been opened, and older ones extended, but women have kept together in one professional body the heads of schools of every social type. The association of headmistresses, founded in 1874 by Miss Buss and seven other heads, now contains 510 members, representing probably 120,000 girl pupils.

(S. A. B.)

#### II. IN THE UNITED STATES

The movement to supply facilities for the higher education of women in the United States developed rapidly in the latter half of the 19th century through the action on the part of a number of the state universities in opening their doors to women students. It was realised that the theory of free public instruction prevailing in the schools should be extended to collegiate institutions, and by 1875 14 state universities, in addition to Antioch, Cornell and Boston, had admitted women to their membership. Doubts had been expressed as to the intellectual capacity of women to undertake curricula which had been formulated solely for men, but such doubts were at once dissipated by the women students themselves. The year 1861 witnessed the foundation of Vassar College, the first privately endowed college for women, and by 1900 a number of institutions had grown up, such as Smith (1871), Wellesley (1875), Bryn Mawr (1880) and Barnard (1889), all independent of state aid. The success of these colleges warranted the president of Bryn Mawr in 1900 in pointing with pride to what had been accomplished up to that time in respect to the higher education of women. The average standing of the women, it was demonstrated, was better than

that of the men students, and the thought that a course of study, modified especially for women, might supplant the men's curriculum had proved unwarranted. The best academic traditions of men's education had become thoroughly accepted as the standard in women's colleges.

There is evidence that the movement has lost something of its brilliance, and the satisfaction resulting from things achieved is not so complete as formerly. There are indications that a modification of curricula in the interest of women may be near. Vassar, in July 1926, opened a course in eugenics, which it defines as the science of home making, rearing of children and bettering of the community. Smith College, with the financial aid of the Laura Spelman Rockefeller memorial fund, founded, in 1925, the Institution for the Co-ordination of Women's Interests, which seeks to relieve the dissatisfaction among college graduates caused by a lack of harmony between their college education and their home life. There were other indications of this tendency in spasmodic attempts at substitutions for, or additions to, established courses. The teaching of technique in music and art has in some cases been added to that of theory. Experience, however, seems to show that the older courses tend to reassert themselves.

At the close of the first quarter of the 20th century the outstanding feature of the women's educational movement was the amazing increase in the number of women students. The following table shows the progress of the movement since 1890:—

*Women Enrolled in Universities, Colleges and Professional Schools:*

|                                | 1890   | 1900   | 1910   | 1920    | 1924    |
|--------------------------------|--------|--------|--------|---------|---------|
| Preparatory                    | 22,219 | 21,471 | 23,426 | 20,915  | 23,033  |
| Collegiate                     | 20,624 | 36,051 | 61,139 | 128,677 | 196,482 |
| Graduate                       | 409    | 1,719  | 2,866  | 5,775   | 10,355  |
| Professional                   | 977    | 2,144  | 5,688  | 3,836   | 5,651   |
| Total Degrees Conferred (A.B.) | 44,229 | 61,385 | 93,119 | 159,203 | 235,521 |
|                                |        | 9,547  | 15,267 | 23,272  | 36,258  |

In 1926 it was stated over one-third of the total number of students enrolled in the colleges and universities of the United States were women.

**WOMEN, LEGAL POSITION OF** (see 28,782).—During the years 1911–26, and especially after the World War, there was a general movement throughout the civilised world towards the emancipation of women from legal disabilities. It was particularly strong in Great Britain, where legal discrimination between men and women has, broadly speaking, ceased to exist, and where women not only exercise the franchise, both parliamentary and municipal, but sit in the House of Commons, where one or two have even attained ministerial rank.

### I. GREAT BRITAIN

**Civil Rights.**—By the Representation of the People Act 1918, which swept away all the old franchises, the parliamentary suffrage was granted to all women, whether single, married or widows, not being less than 30 years of age (see WOMAN SUFFRAGE). There are three qualifications for women as parliamentary electors under the Act—residential, university and as the wife of a local government elector. In her own right a woman may qualify by residence in the electoral area and may in addition have one or more university votes. As the wife of a local government elector she may also have a parliamentary vote, but she may not vote more than once in the same election nor for more than one ordinary constituency in a general election. In addition she may have one university vote at a general election. To qualify as a local government elector she must have (a) attained the age of 21, be resident in the area on the last day of the qualifying period (Jan. 15 or July 15), have occupied some land or premises in the area for the whole of the qualifying period, or, in the alternative, (b) must have attained the age of 30 and be the wife of a man who is entitled to be registered as a local government elector in respect of the premises

in which they both reside. To qualify as a parliamentary elector she must have attained the age of 30 and must be entitled to be registered as a local government elector in respect of the occupation in the electoral area of land or premises of the yearly value of not less than £5, or of a dwelling house, however small the value, or be the wife of a husband entitled to be so registered. This means that the husband must own land or premises in the area of the yearly value of not less than £5.

A peeress in her own right can be an elector, and so can a peeress by marriage. There are certain offices, chiefly in Scotland, which if conferred on a woman would incapacitate her as a voter. The wife of a person serving in military or naval forces of the Crown who would, if he were not so serving, be entitled to be registered as an elector is not disqualified. In the case of a university vote the woman elector must be 30 years of age and must have fulfilled the same academic conditions as a man elector.

Within a year of being admitted to the franchise women were declared capable of holding any public office not being ecclesiastical or military offices. The Sex Disqualification (Removal) Act 1919, which applies to the whole of Great Britain and Ireland, provides that no person shall be disqualified by sex or marriage from the exercise of any public function, or from being appointed to or holding any civil or judicial office or post or from entering or assuming or carrying on any civil profession or vocation or for admission to any incorporated society (whether incorporated by Royal Charter or otherwise), and a person shall not be exempted by sex or marriage from liability to serve as a juror. The Act further provides (a) that His Majesty may by order in Council authorise the admission of women to the civil service, and reserve to men any branch of, or posts in, the civil service in H.M. possessions overseas or in any foreign country; (b) that any judge or other person before whom a case is heard may in his discretion on application (in both civil and criminal cases) by either party or at his own instance make an order that the jury be composed of men or women only, or may on her application exempt a woman from service on a jury by reason of the nature of the evidence or issues to be tried. Section 2 provides for the admission of women as solicitors. Section 3 enables any university to admit women to membership or any degree notwithstanding any statute or charter of such university.

The Act overrides all previous statutes, orders in council, royal charters or other provisions inconsistent with it. In *The Viscountess Rhondda's Claim* (1922, 2 A.C.339), however, it was held by the Committee for Privileges of the House of Lords that the Act did not affect existing patents so as to entitle women to sit in the House of Lords. A peeress in her own right, therefore, is under a double disability: her sex excludes her from the House of Lords and her rank from the House of Commons. Attempts to remedy this anomaly by legislation have so far (1926) been unsuccessful.

**Property.**—The principle of equal rights for both sexes was embodied in the new English law of property which came into force on Jan. 1 1926 (see PROPERTY, LAW OF). Since then in England and Wales a woman, whether married or unmarried, may hold and dispose of property, both real and personal, on the same terms as a man. As regards unmarried women this was little more than a consequence of the assimilation of the law of realty to that of personalty, but the legislative scheme went further: so far as the law of property is concerned the old doctrine of the legal personality of a married woman being merged in that of her husband has disappeared entirely. Under any disposition operating after 1925 husband and wife take as separate persons. Formerly upon intestacy real estate was subject to dower and courtesy and a widow was entitled to the whole of his wife's personal estate, whereas a widow was entitled only to £500 and a third of the remainder of her husband's personalty (or a half if there were no issue). Under the new law dower and courtesy have been abolished and widow and widow are placed on the same footing, i.e., the surviving spouse takes £1,000 absolutely and, as to the remainder of the estate real, and personal,

a life interest in one-half where there is issue, or in the whole where there is no issue.

**Marriage.**—The doctrine of the subordination of the wife and her identity in law with her husband remains operative to some extent in matrimonial law (see MARRIAGE LAWS). A married woman's domicile is that of her husband, and she cannot acquire a domicile of choice even when living apart from him under a decree of judicial separation (*Attorney-General for Alberta v. Cook* [1926] 42 T.L.R. 317). The husband is legally entitled to the wife's obedience, though the extent to which the courts will aid him in enforcing his right is extremely limited. On the other hand, even in the marriage laws, the modifications have been made in the direction of sex equality. Thus, as a corollary to the Sex Disqualification (Removal) Act, the Guardianship of Infants Act 1924 was passed, whereby the guardianship of infant children, which formerly belonged to the father alone, has been vested in the parents jointly, and, in event of the death of either, in the survivor. If the parents disagree, either may apply to the Court, and the Court in making an order is to be guided solely by consideration of the infant's interest.

Another important change in the English law of husband and wife was made by the Matrimonial Causes Act 1923, which relieved a wife petitioner for divorce of the necessity of proving cruelty, desertion, etc., in addition to adultery. (No change was necessary in the law of Scotland, which has always recognised a husband's adultery as in itself a sufficient ground for divorce.) A wife can obtain a maintenance order from a magistrate if she separates from her husband on the ground of his assault on her, or his desertion. Orders made abroad can now be enforced in England, and, if made in England, can be enforced against the husband abroad. Maintenance of the children can also be obtained up to 10s. per child.

The sentiment in favour of sex equality has also resulted in amendments of the English criminal law, but here the modifications have deprived women of some legal privileges that they formerly enjoyed. Thus at common law a married woman living with her husband was deemed incapable of stealing from him, but that immunity was taken away by the Larceny Act 1920. Again, the common law presumption that a woman who commits a crime (other than treason or murder) in her husband's presence does so by reason of his coercion was abolished by sec. 47 of the Criminal Justice Act 1925, though coercion by the husband remains a good defence—that is to say, the burden of proof has been shifted from the prosecution to the defence. (D. CA.)

## II. THE UNITED STATES

With the progressive breaking down of the legal conception of the household as an entity ruled from within by a head, and as an agency of social control, it becomes necessary to give legal recognition and protection to individual interests of women in the domestic relations, which at common law were supposed to be secure through the internal economy of the household, or were left unsecured in view of a paramount social interest in the household as a social institution. Summarily, these may be put as *parental* interests—interests of women in the relation of parent and child, and *marital* interests—interests of women in the relation of husband and wife.

**Parent and Child.**—At common law the father was entitled to the custody of his minor child and the mother had a right to custody only after the father's death. In form this still stands in the books as law, but in substance there has been a complete change within a generation. Equity long ago refused to give effect to the father's common law right of custody as against the interest of the child, and by taking the equitable doctrine of regard for the interest of the child over into the law, the courts have been able to put father and mother upon an equality for practical purposes in almost all jurisdictions. Yet the common law doctrine remains theoretically in force in the absence of legislation, and legislation halts. One decision, as late as 1905, holds that as between father and mother the former has a legal right to control the religious training of the children (*Hernandez v. Thomas*, 50 *Florida Reports*, 322, 336).

**Husband and Wife.**—Marital interests of women include claims against the world at large growing out of the relation of husband and wife, and claims of wives against husbands because of that relation. As interests of personality a wife has claims to the society of her husband, quite apart from any economic advantage; to the affection of her husband, analogous to the legally recognised claim of the husband to the society and affection of the wife; and to the chastity and constancy of the husband as involving her self-respect and honour. These interests, however, are not yet recognised to their full extent and are not fully secured even in legal theory. The first and second are now protected by an action for alienating the husband's affections, which has come to be allowed by the overwhelming weight of American authority (*Turner v. Heavrin*, 182 *Kentucky Reports*, 65, 1918). The third was recognised recently in New York (*Oppenheim v. Kridel*, 236 *New York Reports*, 156). Generally it is at most but partially recognised and indirectly secured; but it should be said that the obvious inutility of the husband's means of redress, which should be applied by analogy to make the law logically complete, has had much to do with the apparent backwardness of the law on this subject.

As an interest of substance the wife may claim to be secured in the marriage relation as an economically advantageous relation, providing her with support and shelter. Where the husband is enticed or induced to abandon his wife or to divert earnings which should be devoted to her support, the courts are coming to recognise this interest directly. (The wife's action was allowed in *Flandermeyer v. Cooper*, 85 *Ohio State Reports*, 327, 1912; it was denied in *Brown v. Kistelman*, 177 *Indiana Reports*, 692, 1912.) On the other hand, in case of physical injury to, or abduction of, the husband, the wife is still usually denied an action, although the husband may recover in the converse case for "loss of service." The claim of the wife to support was recognised fully and secured adequately at common law. Legislation setting up domestic relations courts and providing for criminal prosecution in case of non-support has only put more effective administrative machinery behind existing legal duties of the husband.

The most serious inequalities in this connection were in the procedural difficulties encountered in enforcing the wife's legal rights. Domestic relations courts, which have had a considerable development in the United States, are adapted especially to removing these obstacles (see Smith, *Justice and the Poor*, chap. II.). Modern legislation, although taking away from the husband all control over the wife's property and earnings and committing it solely to the wife, has left untouched the common law duty of the husband to support the wife even if she has property and he has none. Some courts go so far as to allow a wife possessed of means who has supported herself out of her separate estate to sue the husband and obtain restitution of the amount thus contributed. (*De Bauwere v. De Bauwere*, 203 *New York Reports*, 460, 1911.) A few Western States, however, now impose upon a wife of means and ability a duty of supporting an indigent and infirm husband, and allow an action by the husband to enforce this duty (*Hagert v. Hagert*, 22 *North Dakota Reports*, 290, 1911). American courts now recognise the separate domicile of the wife substantially to the full extent of her individual interest in free self-assertion (*Williamson v. Osenton*, 232 *U.S. Reports*, 619, 1914).

So also with respect to actions by the wife against the husband. The older Married Women's Acts, which in form merely removed disabilities as to property and contract, were long construed as not allowing such actions since they did not do so expressly, and a policy against aggravation of domestic troubles by dragging them into court was taken to be in the way. This sacrifice of the individual interests of the wife to the supposed exigencies of a social interest has now definitely given way, and conservative courts are allowing such actions even under statutes in terms dealing with property rights only (*Brown v. Brown*, 88 *Connecticut Reports*, 42, 1914). The more recent type of statute, providing that a married woman shall have the same legal existence and personality after marriage as before marriage, necessarily

permits such litigation (*Fielder v. Fielder*, 42 *Oklahoma Reports*, 124, 1914). As to capacity to own, acquire, use and enjoy property, little remains of the old law, and there are but few jurisdictions where legislation might still accomplish anything.

In one respect, however, improvement by judicial decision is still going forward. A number of States, by derivation directly or indirectly from Spanish law, have the institution of "community property," in which with respect to certain property, and especially property acquired after marriage, husband and wife are treated legally as a sort of property-owning entity. The older view was that the husband was the administering agent of this collectivity during their joint lives, and hence could dispose of it, alter its form, and charge it with his personal debts; and that it could even be taken in execution for his wrongful acts. Recent decisions in some of these jurisdictions, recognising the individual interest of the wife, hold that the community property is not liable for acts done by the husband outside of the reasonable scope of his authority as agent of the community (*Schramm v. Steele*, 97 *Washington Reports*, 309, 1917). Yet even there a claim for an injury to the wife, being an acquisition after marriage and community property, she is not allowed to sue therefore if her husband refuses to join (*Hynes v. Colman Dock Co.*, 108 *Washington Reports*, 642, 1919).

*Protection of Women in Industry.*—American courts have been reluctant to give over, or to construct, legislation as abrogating common law privileges or disabilities which protected married women to uphold legislation restricting freedom of contract on the part of women in industry with respect to hours and conditions of labour and minimum wage. When such statutes were first enacted, they were held unconstitutional as being arbitrary and unreasonable interferences with liberty of contract by a court which had had no hesitation in keeping alive common law disabilities that had long ceased to secure any individual or social interest. That decision has been overruled (*Ritchie v. Wayman*, 244 *Illinois Reports*, 509, 1910), and it seems to be settled that legislation may take account of the facts of women's physical make-up and secure the social interest in a healthy womanhood by regulating the hours of labour of adult females (*Muller v. Oregon*, 208 *U.S. Reports*, 412, 1908; *Bunting v. Oregon*, 243 *U.S. Reports*, 416, 1917). But it is now held that this may not be carried to the extent of fixing a minimum wage for women employees (*Adkins v. Children's Hospital*, 261 *United States Reports*, 525). The political and legal emancipation of women is urged as a reason against such legislation, as if the removal of political and legal disabilities had any relation to, or effect upon, the physical handicaps upon women in industry which are the occasion of these statutes.

*Women on Juries.*—In 1917 California provided for the drawing of women upon juries (*Laws of 1917*, p. 1283). Since the adoption of the Nineteenth Amendment of the Federal Constitution providing for women suffrage, 1920, it has been assumed that women are to sit upon juries everywhere. But in some jurisdictions, out of caution, it is felt that the courts should await express legislation, and in other courts have felt compelled to wait until courthouses and jury-rooms could be adjusted to the novel situation presented by juries of men and women.

(R. Po.\*)

**WOMEN, PROFESSIONAL.**—The period 1910-26 was marked, both in the British Empire and in the United States, and to a lesser degree in other countries, by a general opening of the learned professions to women. The article herewith deals with this aspect of the movement towards sex equality, firstly in Great Britain, and secondly in the United States.

### I. IN GREAT BRITAIN

*Medicine.*—In Oct. 1925 women in the medical profession celebrated the fiftieth anniversary of its opening to their sex. Honours granted to medical women include that of O.B.E. to a woman doctor and a surgeon. Four important medical works were published by qualified women in 1925. About 200 medical women hold honorary hospital appointments in Great Britain, of whom 75 are stationed in London. The major appointments

held include the following: Professor (University of London) of anatomy; associate examiner in obstetric medicine for M.B. and M.S. examination; the representative appointed by the Ministry of Health to the Central Midwives' Board; honorary gynaecologist to the Plymouth Infirmary; surgeon to the Royal Edinburgh Hospital for Sick Children and Edinburgh University; lecturer on the diseases of Children; and honorary physician to the British Hospital for Mental Disorders and Nervous Diseases.

The academic successes gained by women in medicine are too numerous to individualise, but the Brunton Memorial Prize, the highest award Glasgow University faculty of medicine can offer, was gained in 1925 by a woman. Many medical women serve on the various committees and sub-committees of the British Medical Association. There is a Medical Women's Federation for Great Britain, which has voiced the corporate opinion of medical women upon a number of public and professional topics, including the defence of married medical women; regulated prostitution in the Crown Colonies; the reversal of the policy of co-education of students at St. Mary's Hospital, London, and unequal salaries as between men and women employed as officers of health.

Inequality between the sexes is almost as rampant in the professional as in the industrial world. In 1921 there was a recrudescence of the policy of dismissing married medical women begun by the metropolitan borough of St. Pancras dismissing, upon her marriage and unashamedly because of her marriage, its woman assistant medical officer of health, regardless of the fact that her work largely consisted in child welfare and maternity work. The example of St. Pancras was widely followed and the position of the married women in the public health service is at present (1926) most precarious. Lower salaries are constantly offered to women health officers than to men by the municipal authorities—fortunately many medical women are public-spirited enough to refuse them—and the unfair principle of unequal payment is embedded in the Government system where, because unequal pay prevails as between men and women in all grades of the Post Office, exception is not made with regard to women working for it. A good proportion of medical women do really well in private practice. Two women doctors have stood for Parliament and several serve upon local government bodies.

*The Legal Profession.*—The Sex Disqualification (Removal) Act admitted women (*inter alia*) to the legal profession on Dec. 23 1919 and on Dec. 24 1919 the Middle Temple enrolled the first woman bar student in England. Early in 1921 Ivy Williams, LL.D., became the first woman barrister and in Nov. 1921 ten other women were called. As Dr. Williams does not practice, the senior in precedence in date of studentship of these ten, Helena Normanton, B.A., became the senior practising woman barrister in England, in accordance with the bar council regulations then in force regulating seniority. Four women barristers have passed with first-class honours. Several have gained prizes and studentships. Four have had written legal work published. About 12 are in actual practice, out of some 50 who have been called. The number of women students is well on to 100. Several barristers have made really creditable appearances in courts, where judges take no apparent notice of the sex of the advocates before them. Three at least have been highly commended by judges for their conduct of cases.

The senior practising woman was the first of her sex to appear in the High Court (both divorce and chancery divisions), the Central Criminal Court, London sessions, and, in 1925, was briefed to appear before the U.S. Secretary of State at Washington. The early appearances of women barristers in practice has caused more press comment than was at all desirable; this led to a certain degree of male resentment, and a little friction which now appears to be lessening. However, at least two bar messes have refused election to candidates ostensibly upon this ground. Most circuits now admit women but many male barristers still refuse to share chambers with women barristers or to take women pupils. Men solicitors have not yet got into the habit of briefing women, other than a few, and an enormous prejudice still remains to be overcome. The newcomer, if a

woman, cannot yet, at the English bar, reckon on a safe livelihood. Aspirants should have at least £1,000 to live upon after call whilst building up practice.

The majority of women with a legal vocation should carefully consider the greater opportunities open to them in becoming solicitors. Direct contact with the lay client should ensure a livelihood to a capable woman solicitor. By the end of 1925 there were 134 women articulated clerks, and 34 women had been admitted as solicitors, of whom 24 had taken out practising certificates. Eight women had passed with honours and 2 had won important prizes. Miss Carrie Morrison is the senior woman solicitor in England. The training and examinations for women barristers and solicitors are respectively identical with those of men. Marriage is an asset in ordinary professional practice, but it is a bar to the employment of the woman lawyer in the Government service.

*The Church.*—In the Church of England the order of women deacons has been canonically restored by the joint action of the convocations of Canterbury and York, following the proposal of the Lambeth Conference of 1920. This diaconate is on the model of the primitive diaconate rather than on the lines of the present diaconate, which for men is regarded almost entirely as a stepping stone to the priesthood. Women deacons do not at present officiate precisely as the men; neither have they the same sphere of service. Convocation has recently authorised a service for the making and ordering of deaconesses. Marriage is permitted to deaconesses.

There is no specific place for deacon or deacons in the National Assembly of the Church of England, neither in the House of Clergy nor the House of Laity. Women can sit for the B.D. degree at most universities and for the archbishop's diploma—the S.Th. To the National Assembly 49 lay women have been elected. Admission to the priesthood and episcopate of the Church of England does not seem to be within very easy distance, owing to the effect of Lambeth Conference (1920) resolution No. 5. The established Church of Scotland has not yet opened its ministry to women. The ministry of most of the Free Churches is now open to women and the only remaining difficulty is for women to obtain calls to pastorates of responsibility and dignity with adequate remuneration.

*Politics and Diplomacy.*—Perhaps representation of one's fellow citizens is a vocation rather than a profession, but the technical side of political work is now practically a new profession. Speakers and organisers are the principal types of workers. The speakers are graded according to merit. The organisers are divided into missionaries and organisers. The former go round from door to door explaining the party's policy, and for this they must have a wide knowledge of the political questions of the day; the second weld the units into a whole, create and maintain an organisation. The higher posts are those of central office district agents who are placed in charge of areas varying from about 30 to 75 constituencies, and who are responsible, not only for the organisation of women throughout the area, but act in an advisory capacity for other positions. Above these again comes the central office staff, controlling and directing the women's activities throughout the country, and finally the post of chief of the staff.

Diplomacy, a profession opened in 1925 to women in both France and the U.S.A., remains closed to British women by an Order in Council under the Sex Disqualification (Removal) Act 1919. Miss Gertrude Bell, however, did outstandingly good work in Mesopotamia in a quasidiplomatic position and drafted a remarkable state paper upon political matters associated with that district. The consulate is expressly closed to women under the above-mentioned Act of Parliament.

*Other Professions.*—Miss Harris Smith in 1918 was elected an honorary member of the incorporated Society of Accountants. In 1920 the Institute of Chartered Accountants opened its doors to her. The Society of Incorporated Accountants and Auditors admitted women in 1919. There is now a small batch of women accountants in actual practice, some of whom are reported to be doing very well. Miss Ethel Watts, B.A., was the first woman

who passed the final examination of the Institute of Chartered Accountants (1924).

In 1918 Miss L. Charles was admitted A.R.I.B.A. and in 1900 Miss B. Charles. The school of the Society of Architects has been training women since 1918 and there are now several other women architects. Miss Irene Martin is the first woman member of the Surveyor's Institution. The Auctioneers and Estate Agents' Institute and the Land Agents Society have both admitted several women. In Dec. 1922 Miss Aileen Cust became the first fully qualified member of the Royal College of Veterinary Surgeons.

*Journalism.*—The profession of lobby correspondent in the House of Commons was opened to women by the appointment of Miss Stella Wolfe Murray in 1924. Equal minimum pay is at any rate the rule now in Fleet street, but opportunities for women journalists of getting upon the more serious sides of their papers are still very restricted. The editorships of weekly and monthly magazines are the most lucrative spheres for women.

*Engineering.*—In this profession women are making considerable headway. Miss V. Holmes, B.Sc., A.M.I.M.E., was the first woman to be admitted to the Institute of Mechanical Engineers. The Institution of Civil Engineers has one member, that of Automobile Engineers two, of Electrical Engineers eleven, of Marine Engineers two; whilst the Institute of Metals has about twelve members and the Society of Engineers has one. A large Manchester Electrical engineering firm has two women as college apprentices, this being the first occasion in which women have been allowed to serve an apprenticeship in the same way as collegiate men students.

A decision of the International Aerial Navigation Commission forbidding women pilots to be employed by commercial aircraft firms, or even by their own private enterprise to take up passengers for hire, was rescinded early in 1926 by international agreement. (H. NOR.)

## II. IN THE UNITED STATES

The ratification of woman suffrage in 1920 following the spirited discussion of the rights of women and the widespread utilisation of the service of women in the World War, stimulated the entrance of women into all kinds of professional service. This is noticeable, not so much in the increase in the total number of professional women, which grew from about 734,000 in 1910 to 1,016,498 in 1920 (11.9% of all gainfully employed women), but rather in the increases in the newer types of work such as chemists, draftsmen and designers, social workers, college professors, and especially positions in the government service.

The Federal Women's Bureau in Bulletin No. 27, of *The Occupational Progress of Women*, has pointed out that the two groups making the largest gains during the decade 1910-20 were teachers and nurses, although the number of men in these fields declined both actually and relatively. Librarians, both male and female, showed a considerable increase, the women's group more than doubling. There was a decrease in the numbers gainfully employed in the following groups: artists, sculptors and teachers of art; musicians and teachers of music; and physicians, surgeons and osteopaths (both sexes).

Of the more unusual professions the following showed great increases: chemists, assayers and metallurgists; clergymen; lawyers, judges and justices; college presidents and professors; osteopaths, theatrical owners, managers and officials; charity and welfare workers; teachers of athletics and dancing; and draftsmen and designers. On the border line between the professions and the "trades" should be noted increased numbers of bankers and bank officials; insurance agents, real estate dealers and agents; accountants and auditors; dentists and assistants, and telegraph and telephone operators.

Out of the thousands of women in the various professions, 1,582 were listed in *Who's Who in America* for 1920-1. Of these, as compiled by Prof. S. S. Visher, 714 were writers, 244 educators, 127 social workers, 117 artists, 63 actresses, 46 singers, 34 editors, and 28 were physicians. Other professions listed included lawyers, scientists, musicians, explorers and politicians. The great

majority of these lived in or near large cities, one-third residing in New York State. Of the 88% who attended college or university one-half reported training in women's colleges, and 53% of all those listed were married. With the exception of the large groups of teachers and nurses this picture is possibly fairly descriptive of the entire body of professional women. In several of these professions women have won highest honours, including four of the leading prizes for novels offered in 1925, three of the four prizes offered by Harpers Magazine for short stories, and a notable prize in poetry. Women have also done outstanding literary work in biography, criticism and social politics.

In painting and sculpture, fewer women have reached leading positions, although two or three artists have won highest honours in sculpture. In architecture, landscape gardening and interior decoration there has been a great influx of women workers, and the rapidly increasing development of suburban villages offers to the woman with a combination of artistic and business ability an excellent opportunity.

Probably the most notable development of professional service among women has taken place in the fields of political and social welfare. In federal employment, although women were technically given equal opportunity with men in civil service examinations, there still exists discrimination against them in the matter of appointments and entrance salaries. However, the number of women holding public office either as experts, as administrator or as politician has greatly increased. The outstanding positions held by women in the federal service include a third secretary in the legation at Switzerland, a vice-consul in Holland, an assistant United States attorney general, members of the U.S. Civil Service and of the Workmen's Compensation Commission, heads of the Women's and the Children's Bureaux, and many positions as experts and administrators in the various government bureaux. Congress has had one woman senator (temporary appointment) and seven members in the House.

In the state service women are found in practically every branch from sheriff to governor, Texas and Wyoming being the two states claiming the latter distinction. There are nearly 150 women in the various state legislatures; several state superintendents of public education; and hundreds in city and county offices, including the important position of secretary of state in New York. The highest paid women in state service is the registrar in New York county who receives \$12,000 a year, and one of the most honored positions is that held by the woman member of the Ohio State Supreme Court. Municipal or district courts have opened their doors to women jurists much more frequently during the decade (1915-25) and the number of women with a private law practice has been a notable development.

The more intelligent treatment of delinquent children and erring girls has developed in the last decade an almost new profession. Juvenile courts have been established with women officers to study the child and its home condition and make recommendations to the judge. Also in connection with municipal police departments, women's divisions have been established in about 120 cities and villages and a national organisation of policewomen has been formed. In the 1910 census this occupation was not listed but in 1920, 236 were so recorded. Religious, charity and social workers, according to the 1920 census more than trebled, and keepers of charitable and penal institutions more than doubled. (I. A. \*)

*The League of Nations.*—The charter of the League of Nations contains a clause rendering women eligible for all its appointments, including those on the secretariat. This clause did not remain a dead letter. Besides a large number of women in less responsible positions, Dame Rachel Crowley was made director of the section dealing with the white-slave and opium traffic; with the care of women and children. At the first assembly of the League (Geneva, Nov.-Dec. 1920) Sweden appointed Mrs. Wicksell and Norway Dr. Kristine Bonnevie as alternate representatives of their respective countries; and in Sept. 1922 Great Britain appointed Mrs. Coombe Tennant as Substitute Delegate, Mrs. Swannick received the same appointment under the Labour Govt., and Mrs. Alfred Lyttelton under the Conservative Govt.

of 1924 and the Duchess of Athol in 1925. Miss Forchhammer, of Denmark, brought forward in the full assembly the subject of the white-slave traffic, and was successful in carrying her proposal to appoint a commission of three persons, one of whom must be a woman, to prosecute a special inquiry on the subject in the Near East. Miss Sophie Sanger was made head of the Legal Section of the International Labour Bureau.

**WOMEN, WAR WORK OF.**—It is impossible here to attempt to describe the special work done by women of all the belligerent countries in 1914-8; this article, therefore, is confined to an outline of women's war-work as organized in the United Kingdom and the United States.

## I. IN GREAT BRITAIN

On Aug. 3, before the official declaration of war, the executive committee of the National Union of Women's Suffrage Societies decided to suspend political action and devote the organising capacity of the Union to meet the changed conditions. The London branch started a free bureau under the name of "Women's Service" to direct the efforts of the thousands of non-professional women eagerly desirous of finding useful work. Many young women began at once to prepare themselves for nursing, joined Voluntary Aid Detachments and worked in auxiliary hospitals. The raising of funds and making of comforts for the units of the original Expeditionary Force absorbed others, and the arrival of the Belgian refugees in England before the end of Aug. caused the formation of 2,500 local Belgian relief committees, of whom the members were mostly women. Clubs to help the wives of soldiers and sailors were started. The Women's United Services League co-ordinated and registered the work done by war clubs throughout the kingdom. A large number of women devoted themselves to the work of the Soldiers' and Sailors' Families Associations, and to the work of the Officers' Families Fund.

In the early months of the war it became evident that the abnormal conditions arising from the quartering of large numbers of soldiers in barracks and camps, and of convalescents in hospitals, would give rise to social dangers, and that steps should be taken to deal with the situation. A militant suffrage society, the Women's Freedom League, formed the Women's Police Volunteers in Sept. 1914. This corps was reorganised shortly afterward as the Women Police Service. To cope with the same evil the National Union of Women Workers called an emergency meeting and as a result a corps of "Women Patrols" was formed to work under the official sanction of the commissioner of police in the metropolitan district, and of the chief constables in the provinces.

*Voluntary Organisations and Corps.*—A corps of women called into existence to meet war conditions was the Women's Emergency Corps. In addition to relief workrooms, and the registration of voluntary offers of service, schemes were started under its auspices which developed independently, after the parent corps had met the "emergency" conditions of dislocation of labour and refugee relief. The collection of surplus food from the London markets for the unemployed and for Belgian refugees developed into the National Food Fund, which raised £163,615 in gifts of food and money before the end of the war. The Women's Volunteer Reserve, founded in 1914 as a branch of the Women's Emergency Corps, "to provide a trained and disciplined body of women ready to assist the state in any capacity," did military drill, wore khaki uniform and saluted their officers. The founders' idea that, as signallers, despatch riders, telegraphists and motorists, they might set free men for the firing line, was premature in 1914, but anticipated the need actually met later by the women of the Army Service Corps and Q.M.A.A.C.

By the spring of 1915, when the country began to feel the drain on its man-power, the Marchioness of Londonderry founded the Women's Legion, which from the first was intended to be a corps of paid women replacing paid men. A khaki uniform was worn and the women were subject to regulations and discipline. Ultimately over 40,000 were enrolled. This corps was the link

between the independent voluntary associations of women, such as the Emergency Corps, formed on the outbreak of the war, and the official women's services, two of which were sections of the Women's Legion.

**Work on Land.**—Throughout 1915 and 1916 efforts were made by voluntary organisations, such as the Women's Legion and the Women's Defence Relief Corps, as well as by the Government, through the War Agricultural Committees of the Board of Trade, to induce women to offer their services on the land and to persuade farmers to accept them. The Women's Farm and Garden Union, the most important of the bodies which had dealt with women's work on the land before the war, started a system of training farms in the autumn of 1915. Early in 1916 the Government provided a grant, and the Women's National Land Service Corps was launched as a war off-shoot of the Farm and Garden Union. By the end of the year the demand for women had become greater than could be met by a small voluntary association, and the Women's Land Army was instituted early in 1917 as a Women's Branch of the Ministry of Agriculture. The corps continued to act as the agent of the Land Army for organising the supply of women as seasonal workers.

**Munition Making.**—By the spring of 1915 shell work for women was beginning; in March women tram conductors started work at Glasgow, and girls were employed as telegraph operators in Liverpool. But women were impatient at the slowness of the progress of industrial substitution and at the uselessness of the women's war service register compiled by the Board of Trade in March 1915. In connection with the demand for skilled workers, the London Society for Women's Suffrage, which promoted the introduction of women into occupations hitherto reserved for men, started a munitions and aircraft department in July 1915, and arranged the first training classes in oxy-acetylene welding. The pupils were the first women welders to enter the engineering trade, and after two years the Ministry of Munitions assumed financial responsibility for the school. Messrs. Beardmore in Glasgow and Messrs. Vickers at Barrow-in-Furness and at Erith employed women on shell-making in the spring of 1915. In order to ease the strain due to Sunday work, a band of women relief munition workers, educated women of the leisured class, were trained in the rough turning and boring of 4.5 shells and 18-lb. shrapnel at Erith; they bound themselves after training to undertake week-end shifts for six months.

**Enrolled and Non-enrolled Women.**—The Women's Services were of two types. First came those composed of enrolled women in the legal sense, who were in the direct employment of the War Departments, and whose contracts brought them within the regulations of the Defence of the Realm Act. The women could be enrolled as mobile workers for home service only, or for service at home and abroad; or as immobile workers, recruited for local employment, who could not be required to move away from the district. Secondly came those composed of non-enrolled women in the legal sense, who did not render themselves liable to penalties under the Defence of the Realm Act and might be engaged on an annual or weekly contract. Some services enrolled their women for a year only; others for the duration of the War.

The enrolled women consisted of the various army nursing services, the Military Massage Service, which started its career in Aug. 1914, under the name of the Almeric Paget Massage Corps; the Women's Forage Corps; Queen Mary's Army Auxiliary Corps; the Women's Royal Naval Service, commonly known as the "Wrens"; and the Women's Royal Air Force. (See NURSING.)

In Queen Mary's Army Auxiliary Corps which was at first the Women's Army Auxiliary Corps or familiarly the Waacs, the women were enrolled as mobiles for home service only, or for home or foreign service, and for the duration of the War; they received a special rate of pay, not civilian or military, and were not enlisted under the Army Act. At first substitution overseas only had been contemplated, but by March the number of women recruited by the Department of National Service was so great that home commands were included in the scheme. Recruiting was afterwards carried on through the Employment Department of the Ministry of Labour. In Dec. 1917, owing to the shrinkage of available woman power, an immobile branch was

formed. Women employed in the Ordnance Army Pay Department and Record offices at home were not made to join the Corps. A khaki uniform with distinguishing badges was worn. In all there were 1,200 officials and 56,000 women, of whom 9,500 were the outside number employed in France at any one time. This figure was made up of women working in the Calais, Boulogne, Etaples, St. Omer, Abbéville, Dieppe, Rouen and Havre areas and on the lines of communication, chiefly at army schools, and in certain offices at G.H.Q.

In the Women's Royal Naval Service the officers, other than those engaged in the organisation, welfare and discipline of the women, replaced naval officers for the following work: coding and decoding, intelligence work, confidential books, secretaries, telephone exchange, paymasters, accountants, gas mask work and observation station. The ratings were employed as ledger clerks; clerks; shorthand typists; victualling store assistants, telephone operators, postal sorters, stewards, cooks, general domestic workers, orderlies and messengers, porters and storewomen, bakers, tailoresses, gas mask workers, gardeners, fitters, turners, boiler cleaners, boot cleaners and painters, wiring hands, net mine workers.

As regards the Women's Royal Air Force, 566 officers and 31,764 other ranks passed through the service, the strength at the time of the Armistice being rather over 25,000. The Service consisted of mobiles and immobiles in approximately equal proportions. In addition to the administrative, clerical and domestic work common to all the Services, the women were employed on meteorological work and as despatch riders, dopers, painters, acetylene welders, carpenters, magneto-repairers, photographers and drivers. Fabric workers did duties of all kinds from the covering of aeroplane wings to the mending of the finest balloon silk.

Non-enrolled women included the Anti-Gas Department, the Army Pay Corps, the Army Remount Department, and the Navy and Army Canteen Board. Practically the whole of the work on gas-mask manufacture was performed by women. There were 34 factories employing 12,000 under the immediate control of the Anti-Gas Department and 160 contractors employed a further 90,000 on work for the Department. In Aug. 1917 a number of educated women were trained for inspection work on the mask of the respirator and drafted out to the factories. They wore an indoor uniform of scarlet and were called "red-coats." Ultimately 800 to 1,000 of these were appointed, and 100 were promoted to the duties of check inspecting, formerly performed by sergeants of the Anti-Gas Department. They were also known as sergeants, and, as regards their duties, were interchangeable with the men.

**Army Pay Corps.**—The Army Pay Department was one of the earliest in the army to substitute female clerks. In July 1915, 479 were working and by Jan. 1 1916 there were 4,556 female clerks and 13 lady superintendents. The engagement was a weekly one and there was no form of contract till Aug. 1917. By that time the demands made for women by the W.A.A.C. and other organisations were so insistent that a form of agreement to serve for the duration of the war and three months afterwards was signed by the superintendents and a portion of the women doing skilled and semi-skilled work. These wore a badge but no uniform, and by March 1918 there were 5,171 of them out of a total of 17,500.

**Navy and Army Canteen Board.**—When the Navy and Army Canteen Board (then called the Army Canteen Committee) started operations in April 1916, only 20 women clerks were employed. During 1917 the Board's activities were enormously expanded to include catering for the Imperial Overseas Forces and for the American and Allied Troops. It was decided in March 1917 to institute a N.A.C.B. Women's Corps in mobile and immobile sections, and by the date of the Armistice the women employed in connection with canteen organisation in the mobile corps numbered 10,000 and the clerical staff in the immobile corps, 2,000.

Another branch of women's work was concerned with providing supplies for the fighting forces.

## II. IN THE UNITED STATES

When the United States entered the World War in April 1917, but one organisation depending mainly on the efforts of women was officially recognised by the Government, the Red Cross. On May 6 1917 the Red Cross had 562 chapters with a membership of 486,194. At the signing of the Armistice, it had more than 3,500 chapters and upwards of 8,000,000 regular volunteer women workers. These women produced in 20 months over 371,000,000 relief articles, including surgical dressings, garments for the wounded and the refugees, and a variety of comforts and conveniences for soldiers and sailors. The value of their output was about \$94,000,000. The Red Cross enrolled during the War 23,822 women as nurses. They served in the military and naval hospitals in the United States, Europe and the Near East, as well as in convalescent homes for soldiers and sailors and in relief work for adults and children both in the United States and overseas. They worked in 700 Red Cross canteens in the United States and 130 in France, serving refreshments to moving troops, giving them medical care and transferring them when sick.

When War was declared many large national organisations of women applied to the Government for instructions. The Council of National Defense appointed, at the end of April 1917, a committee of nine women (afterwards increased to eleven), to form a plan by which the women of the country could be utilised. This committee selected a woman in each state as a temporary chairman, requesting her to call together the heads of all national organisations of women in her territory to elect permanent officers for a state division. This state division was in turn to organise county committees and each county was to form a division in each city and town. This work of organisation was carried on so rapidly that by Dec. 1917 the county organisation was complete in no less than 23 states, and a year later there were county chairmen in more than 80% of all the counties in the country.

The plan of work which the women's committee laid out included the following departments: (1) registration for service, (2) food production and home economics, (3) food administration, (4) women in industry, (5) child welfare, (6) maintenance of existing social service agencies, (7) health and recreation, (8) educational propaganda, (9) Liberty Loan work, (10) home and foreign relief. The specific tasks for these departments originated either in requests or suggestions of the Government or in plans made by the committee itself and approved by the Government. Two months after the women's committee was created the Government requested it to enrol the women of the country in a league to support such plans for food conservation as the food administration might present. In a few weeks 5,223,850 pledge cards were signed. The signers were the nucleus of a women's food army which, throughout the War, responded to every request for the conservation, substitution or production of foods made by the food administration. Throughout the War, the women's committee continued to serve the Government in similar drives.

The National League for Women's Service, an organisation formed after a study of the activities of Englishwomen, some weeks before the United States went into the War, developed an extensive motor corps, carried on a variety of services to soldiers and sailors, and effectively supported all drives. The Y.W.C.A. organised in June 1917 a war council, under which it developed a variety of service clubs, both in the United States and overseas, particularly France. The hostess houses of the association at the home camps of both white and coloured soldiers looked after women visitors, a service which proved of such value that the War Department at the close of the War took the work under its educational and recreational branch. Some 50 buildings were turned over to the Government by the war works council of the Y.W.C.A. Overseas the association conducted service clubs which served Red Cross nurses and other women workers. Both in France and in the United States this organisation carried on industrial service clubs near a number of large manufacturing centres.

**WOMEN'S SUFFRAGE** (*see* WOMEN, 28,786).—The period 1910–25 was marked by the extension of the franchise to women in Great Britain and in a number of other countries and, partly as a consequence of the World War, by a general recognition of the right of women to the privileges of citizenship.

## I. IN GREAT BRITAIN

In the later years of the agitation for woman suffrage in Great Britain the constitutional suffragists, led by the National Union of Women's Suffrage Societies (N.U.W.S.S.), concentrated their efforts on the formation of public opinion. They secured a majority of members pledged to their support in each House of Commons after 1886; and in that year, and also in 1897, 1908, 1909, 1910 and 1911, woman suffrage bills passed their second reading, but each successive Government declined to give the necessary further facilities. The constitutional movement received valuable support from platform, press and pulpit, and from the theatre in plays by leading dramatists of the day. The suffrage party, led by the Pankhursts sought to promote the cause first by sensational actions and even by violence.

*"Militancy."*—The question of "militancy" was from the first a problem for the Liberal Governments of 1906 and 1910. They were responsible for order and as they were backed by the physical force at the command of the state the contest was unequal: Anti-suffragists had believed that "militancy" would kill the suffrage movement: therefore the greatest publicity was given to every act of violence and to every intemperate speech by the "militants." But so far from killing the suffrage movement, the all-pervading discussions stimulated it as nothing else had done. It was a difficult time for the law-abiding suffragists, who objected to "militancy" because they believed the use of physical force as political propaganda was invariably mischievous. The N.U.W.S.S. issued strong protests against militancy, and they excluded militants from membership. They deprecated the use of "frightfulness" on either side, and urged that the real cure for violence was the redress of grievances.

Serious differences thus arose between the two branches of the suffrage movement. The militants bitterly resented criticism, and made organised efforts to prevent its expression by trying to break up the meetings of the law-abiding suffragists. For the first time since 1886 woman suffrage bills were defeated in the House of Commons, once in 1912 and once in 1913. But other circumstances had contributed to these defeats. At the two general elections in Jan. and Dec. 1910, Mr. Asquith and his party emerged victorious, but in the second his majority fell from 334 to 124. He had promised at a public meeting in Dec. 1909, if returned to power, to bring in a Reform bill and to allow a woman suffrage amendment to be an open question for the House to decide. Just before the Dec. election, he said that, if his Government remained in power, they "would give facilities for proceeding effectively with a woman suffrage bill, if so framed as to admit of free amendment." Both in July 1910 and in May 1911 the House of Commons carried by immense majorities second readings of the measure known as the Conciliation bill.

*Electoral Reform.*—This bill was of a very limited character, proposing to enfranchise only about 1,000,000 women householders, and was opposed. The second reading in 1910 was, however, carried, though opposed by Mr. Lloyd George on the ground that it was not sufficiently democratic. In 1911 after the general election, suffrage prospects seemed particularly bright; militancy had been suspended in order to give the Conciliation bill a chance; all the suffrage societies were working harmoniously together, when a statement by Mr. Asquith affected these favourable prospects. He announced on Nov. 2 1911 his intention of introducing during the session of 1912 the Electoral Reform bill he had foreshadowed in 1908. This bill would sweep away all existing franchises; the new franchise would be based on citizenship, and votes were to be given to "citizens of full age and competent understanding," but no mention was made of women. On being asked what his bill would do for them, Mr. Asquith dismissed the inquiry with

the statement that his opinions on the subject were well known and had suffered no change: but he reiterated his promise of "facilities" for the Conciliation bill in the session of 1912. It cannot be pretended that the suffragists were satisfied with this procedure.

A violent outbreak at once took place. Windows were smashed in the principal shopping streets of London, and personal assaults were made on members of the Government. The constitutional suffragists were as angry as the militants. Many strong suffragists in the Women's Liberal Federation broke from their party, and gave all their energies to the suffrage cause. On Nov. 18 Mr. Asquith received a deputation representative of the whole woman suffrage movement, militant and non-militant. In the course of his reply to the deputation he said

that, if the House of Commons on its responsibility is prepared to transform or extend a measure which we are agreed in thinking necessary—a measure for the franchise as regards men—and to confer the franchise on women, we shall not only acquiesce in that proposal, but we shall treat it as the considered judgment of Parliament and shall make ourselves responsible for carrying it out.

Twenty-six days after this Mr. Asquith received a deputation of anti-suffragists to whom he declared that he regarded "the grant of the parliamentary franchise to women as a political mistake of a very disastrous kind." This pronouncement gave direct encouragement to those who desired the defeat of the Conciliation bill. One of the devices employed was to induce the Irish Nationalist party to withdraw their support. They were persuaded that the grant of woman suffrage would break up the Government and thus prevent the third ratification by the Commons of the Home Rule bill necessary to secure (under the Parliament Act) its passage into law notwithstanding its rejection by the House of Lords. These tactics, aided by a coal strike which caused the absence of 13 Labour members in their constituencies, were successful, and the Conciliation bill, which had been carried on second reading on May 5 1911 by 255 to 88, was defeated on March 28 1912 by 222 to 208.

*The Reform Bill of 1912.*—When the Government Reform bill was produced it was called a Franchise and Registration bill. It came on for second reading on July 12 1912. In his speech Mr. Asquith said: "This bill does not propose to confer the franchise on women; whatever extensions of the franchise it makes are to male persons only." He then referred to the defeat of woman suffrage in March as the "considered judgment of the House," and he dismissed as "an altogether improbable hypothesis the possibility that the House would stultify itself by reversing this judgment during the same session." Notwithstanding this ominous warning Mr. Lloyd George and Sir Edward (Viscount) Grey advised that amendments to the Government bill gave suffragists the best chance they had ever had of parliamentary victory.

The bill itself, however, made no further progress during 1912; the protracted session lasted all through that year and overflowed into 1913; it was officially announced that the committee stage would be taken on Jan. 24. Three days from Jan. 24 had been allotted for the discussion of the woman suffrage amendments. This stage was, however, never reached. On Jan. 23 Mr. Bonar Law asked the Speaker to give a ruling on the point whether the Government's own amendments, regarding the occupation franchise for men, did not so far alter the bill, which had received a second reading in July, as to make it a new measure and necessitate its withdrawal and reintroduction in its new form. In his reply the Speaker intimated that this was his view, and added that there were "other amendments regarding female suffrage which of course would make a huge difference to the bill if they were inserted." The bill was killed by this ruling. Mr. Asquith refused to receive the suffragists in deputation, and merely offered parliamentary time for the discussion of yet another private member's bill. All the suffrage societies repudiated this offer, and did nothing to support the bill, which was brought forward in May 1913 and defeated by 266 votes to 219.

These events convinced the N.U.W.S.S. that nothing would

now be of any use but a government bill with the whole weight of the party in power behind it. Their executive therefore resolved "that in judging which of two pro-suffrage candidates should be supported in an election, the official attitude of the party to which the candidate belongs should be taken into consideration." As Labour was the only party which had definitely made suffrage part of its programme, this change threw the influence of the N.U.W.S.S. in the elections definitely on the side of Labour; and a special fund, called the election fighting fund, was formed for the support of Labour candidates. N.U.W.S.S. support undoubtedly contributed substantially to the defeat of six government candidates in by-elections. Public opinion moved rapidly and strongly in the suffrage direction, the general view being that suffragists had received less than fair play at the hands of Mr. Asquith and his Government. The societies were preparing for the electoral campaign expected in 1915, when on Aug. 4 1914 the World War broke out, not only destroying all opportunity of suffrage work but jeopardising the very existence of representative institutions in Europe.

*The Cause and the War.*—Suffragists, whether militant or non-militant, quickly saw where their duty lay. The militants instantly abandoned every sort of violence and organised themselves for public service. They formed a Women's Emergency Corps, ready to undertake all kinds of national work which the exigencies of the time required. Others, both militant and non-militant, in spite of official discouragement, undertook the organisation of hospital units entirely officered by women (see WOMEN'S WAR WORK). The N.U.W.S.S. committee on Aug. 3 resolved to suspend immediately all political propaganda and to use their staff and organising power in mitigating the distress caused by the War. Their societies, numbering over 500, were consulted by post, and all but two approved this course.

The part which women played in industry and in the professions in helping to win the War gradually won recognition and gratitude from the entire nation. An agreement was made between the Treasury and the trade unions to suspend the trade union rules which excluded women from most of the skilled trades. The courage of the women in the dangerous trades was as marked as their efficiency. On one occasion 26 women were killed and 30 injured by an explosion; those who remained uninjured displayed the greatest coolness and discipline, and were prompt both in helping the wounded and in continuing the work of the factory. The legend of the innate timidity of women was thus undermined. The tide in this direction rose so high that even Mr. Asquith was floated by it, and in speaking in Oct. 1915, in the House of the heroic death of Edith Cavell, he said: "She has taught the bravest man among us a supreme lesson of courage; yes, and there are thousands of such women, but a year ago we did not know it." There is no doubt that by 1915-6 the country was by a great majority favourable to the enfranchisement of women. Nevertheless it would have been impossible to induce Parliament to pass a great Reform bill during the War if it had not been that the electoral position of millions of soldiers, sailors and munitions workers was so anomalous as to amount to a public scandal. The parliamentary register, by the direct orders of the Government, had not been revised since 1913, the position was intolerable, but it was not at first clear how best to amend it.

*The Conference.*—Mr. Walter (later Lord) Long suggested the appointment of a non-party conference, consisting of members of both Houses, selected and presided over by the Speaker, to consider the whole subject of electoral reform including woman suffrage. Mr. Asquith concurred and the House agreed. The conference began its sitting in Oct. 1916, and reported on Jan. 28 1917. In the interval Mr. Lloyd George had succeeded Mr. Asquith as Prime Minister, a change very favourable to immediate action in the direction of woman suffrage. The Speaker's Conference unanimously recommended a new franchise for men amounting practically to manhood suffrage; for women it recommended, but not unanimously, household suffrage, including wives of householders, a higher age limit for women, and their admission to the university franchise. This was the scheme

subsequently adopted by Parliament. The object of the high age limit (30) for women was to produce a constituency in which male voters were in a substantial majority. It was believed by suffrage members of the conference that the acceptance of this was essential to success. The anticipated proportion of women to men in the new electorate was as 2 to 3. This expectation proved practically correct. The new register published in 1919 showed: men 12,913,160: women 8,479,156.

*The Vote Granted.*—Within a fortnight of his becoming Prime Minister, and a month before the Speaker's Conference reported, Mr. Lloyd George intimated to the leaders of the N.U.W.S.S. that he intended to proceed with women's enfranchisement. The object was to get an agreed measure supported by every party in the House. This was achieved. When on March 28 1917 Mr. Asquith moved a resolution in Parliament calling on the Government to introduce a Representation of the People bill based on the recommendations of the Speaker's conference, the leader of every party supported the enfranchisement of women, and the motion was carried by 341 to 62. Under pressure from the women's societies the local government franchise for women was amended on the same principle which the House had already accepted for the parliamentary franchise—namely, to include not only householders but wives of householders.

The anti-suffragists in the Lords were a more formidable group than in the Commons. Lord Curzon, president of the Anti-Suffrage Society, was the leader of the House and chief representative of the Government. The inclusion of women in the bill was vigorously resisted in the early stages by Lord Bryce and Lord Balfour of Burleigh; but there was no real fight upon it until the committee stage was reached and the women's clauses came on. But at the end of the Speech with which Lord Curzon concluded the debate he reminded the peers that the House of Commons was the sole constitutional representative of the feelings of the country; that in the Commons woman suffrage had been supported by large majorities of every party "including the one to which most of your lordships belong." He declined to be responsible for a conflict with the House of Commons and announced his intention of not voting either for or against the amendment. The division was: for the clause, 134; against 71. Thus ended the 50 years' struggle of British women for political liberty. Royal assent was given to the bill on Feb. 6 1918.

## II. IN THE BRITISH DOMINIONS

The granting of woman suffrage in Canada was almost simultaneous with its victory in England. It was first adopted in the provinces (except Quebec) in 1916, and by the Dominion in 1917. Canada was well in front of the mother country in the matter of the eligibility of women. Miss MacAdams was elected to the Legislature of Alberta by the votes of soldiers on duty in England and France in July 1917. The first Woman Suffrage Act for the Dominion limited the vote to women who had near relatives serving overseas. Full suffrage followed, the first woman to sit in Parliament at Ottawa being Miss Agnes MacPhail in March 1918.

New Zealand had enfranchised its women in 1893, and enfranchisement followed in the Commonwealth of Australia in 1902; therefore, South Africa is the only self-governing overseas dominion of Britain which has not given political freedom to women. In March 1921 Mrs. Cowan was elected to the Parliament of West Australia, the first woman M.P. to be elected in Australia. Jamaica, South Rhodesia and British East Africa gave votes to women in 1919 and 1920.

A strong effort was made by Indian women, supported by the Begum of Bhopal, to induce Parliament to incorporate in the Govt. of India Act the principle of woman suffrage, and the Act, as finally passed, specifically left the question of woman suffrage to be decided, province by province, by the elected Legislatures of India herself. Up to Oct. 1925 this power had been used to enfranchise women in Bombay, Madras, United Provinces, Assam and Bengal. Burma also adopted woman suffrage when it became a province of India.

## III. IN THE UNITED STATES

American women had been the earliest to make a definite organised struggle for political freedom, having started in 1848, but they were among the last to win. This was in part due to the U.S. Constitution, which can only be amended by a two-thirds majority in both Houses of Congress, and even then the amendment does not become operative until it has been ratified by three-fourths of the 48 states. The suffragists worked state by state until there were some 20 suffrage states. The turning-point in the struggle was the victory gained in the State of New York in 1917, after America had joined in the War.

The necessary two-thirds majority was secured in the House of Representatives in Jan. 1918, but there was not a single vote to spare, and the narrow margin weakened the position, especially as the Senate had yet to be won; but in May 1919 the amendment was again brought up in the House and was carried by 304 to 48; and victory in the Senate followed almost immediately. Then came the battle for ratification in 36 states. The first stages were easy and rapid, 11 states giving a unanimous vote in both Houses, and 7 more in one or other of their chambers. After this the victories came more slowly until, in May 1920, 35 states had ratified and only one more was needed. The issue was much obscured by the impending presidential election. Both candidates were, as in 1916, suffragists. Both parties probably believed they would gain an advantage if they could plausibly claim that their effort had given the final victory to women. Tennessee, a Democratic state, voted for the amendment by the necessary majorities in Aug. 1920; legal objections to its validity were, however, raised, but not in time to prevent the proclamation by the Secretary of State in Washington that the 19th Amendment to the U.S. Constitution had been carried.

The legal points, however, awaited decision in the High Court. This gave an opportunity for a Republican state, Connecticut, to come to the rescue; a special session was called and the 19th Amendment was ratified on Sept. 21 1920. This made the Tennessee objections negligible for, valid or invalid, the 36th state had now ratified and the following article was added to the Constitution: "The right of citizens of the United States shall not be denied or abridged by the United States or by any state on account of sex." The first woman to enter Congress was Miss Jeannette Rankin of Montana.

## IV. IN OTHER COUNTRIES

Before the World War there were only four countries in the world where women exercised the political franchise; by the end of 1920 there were 28—namely, the United Kingdom, Canada, Australia, New Zealand, British East Africa, Rhodesia, Jamaica, Denmark, Norway, Sweden, Finland, Iceland, Holland, Rumania, Servia, Luxembourg, Germany, Austria, Hungary, the United States; and, among the states newly formed by the peace treaties of 1919, Poland, Estonia, Lithuania, Latvia, Czechoslovakia, the Ukraine. In Germany 117 women sit in the state legislatures, and women form 8% of the membership of the Reichstag.

In Sweden Mrs. Anna Wicksell is a member of Parliament, and since 1921 she has represented her country on the Permanent Mandates Commission of the League of Nations.

## V. CONCLUSION

In seeking a cause for so great a development of principles for which comparatively small groups of women, without any direct political power, had worked in some countries for more than half a century, it may probably be found in one circumstance common to them all. In each country a national crisis had arisen, on the issue of which the whole fate of the nation depended. National feeling in each had been stirred to its utmost depths. Under its pressure class feeling was minimised; all sorts and conditions of men and women had worked and suffered together for what each felt to be a cause of supreme importance. Men and women acted as friends and comrades when the issue was uncertain, and when the end came the men

did not forget the work and the sacrifices of the women. In all countries, whether victors or vanquished, it was universally acknowledged that all through the anguish of the War the women had not been backward either in self-sacrifice, courage or capacity. It was this feeling which broke down the opposition to women's votes and to the participation of women in all the professions and in all walks of public life, in nearly all the warring-nations. It was felt also that men by themselves, as a well-known journalist expressed it, had made a mess of the world and needed helpers; men and women together being generally more successful than either men or women by themselves.

**WOOD, SIR HENRY EVELYN** (1838-1919), British soldier (see 28.789), died at his home in Essex Dec. 2 1919.

**WOOD, LEONARD** (1860- ), American soldier, was born at Winchester, N.H., Oct. 9 1860. He graduated from the Harvard medical school in 1884, was appointed acting assistant surgeon, U.S.A., in 1885, becoming assistant surgeon with the rank of first-lieutenant in 1886, when he was assigned to Capt. Lawton's expedition against the Apaches in the Southwest, resulting in the capture of Geronimo. For distinguished services he was awarded the Congressional Medal of Honour. In 1891 he was promoted captain and full surgeon, and later, while stationed in Washington, D.C., became the close friend of Theodore Roosevelt, then Assistant-Secretary of the Navy. On the outbreak of the Spanish-American War in 1898 Wood was commissioned colonel 1st U.S. Volunteer Cavalry (the famous Rough Riders) with Roosevelt as lieutenant-colonel. For conduct at Las Guasimas and San Juan Hill, Wood was promoted brigadier-general, July 1898, and in Dec. major-general of volunteers. He was military governor of Cuba from 1899 to 1902, when the Cuban Republic was established. He was appointed brigadier-general U.S.A. Feb. 1901. In March 1903 he was sent to the Philippines and appointed governor of the Moro province, being promoted major-general in Aug. of that year. From 1906 to 1908 he was commander of the Philippine Division. In 1908 he returned to America as commander of the Eastern Department. In 1910 he was special U.S. ambassador to the centenary celebration of Argentine independence. On his return he was appointed chief of staff, U.S. Army, serving until 1914, when he was again given command of the Eastern Department.

General Wood often had disapproved the policies of the War Department, and as early as 1908 had urged preparedness. To him was largely due the establishment of a summer camp at Plattsburg for training civilian officers, which was taken as a model for other camps of the kind after America's entrance into the World War. In 1915 he gave unofficial endorsement to the proposed formation of the American Legion whose purpose was to establish a body of some 300,000 men ready for immediate service, but his action was disapproved by the Secretary of War. Just before America's entrance into the World War in 1917 it was announced that the Eastern Div., then under Gen. Wood's command, had been divided into three divisions, and Gen. Wood was assigned to the Southeastern Div., with the alternative of choosing either Hawaii or the Philippines. As a soldier desiring active service he naturally chose the American post. He was later transferred to Camp Funston, where he trained the 89th Div., N.A. In Jan. 1918 he was sent to France on a tour of observation, in the course of which he was wounded by the explosion of a French mortar.

After his return to America, General Wood was on the point of embarking with the 89th Div., when he was suddenly assigned to the Western Department, no reason being given. It was

generally understood that his name was not on the list of officers submitted by Gen. Pershing as acceptable for duty overseas. By change of orders he was returned to Camp Funston, where he trained the 10th Div. of the regular army and other troops. In 1919 he was put in command of the Central Department, with headquarters at Chicago. In 1920 he was a prominent candidate for the presidential nomination at the Republican National Convention. He led on the first four ballots and never fell below second place. Harding, a "dark horse," was nominated on the 10th ballot, with 692½ votes to 156 for Gen. Wood. In 1921 Gen. Wood was sent at the head of the Wood-Forbes mission to the Philippine Islands to report on conditions there. Prior to leaving he was appointed head of the University of Pennsylvania, but was unable to assume charge owing to the President's desire that he should remain in the Philippines as governor-general, a position to which he was appointed in Oct. 1921. He was the author of *The Military Obligation of Citizenship*, lectures at Princeton and elsewhere (1915); *Our Military History, Its Facts and Fallacies* (1916), and *Universal Military Training* (1917).

See I. F. Marcossou, *Leonard Wood, Prophet of Preparedness* (1917); Joseph H. Sears, *The Career of Leonard Wood* (1919); and *Leonard Wood on National Issues* (1920), compiled by Evan J. David.

**WOODWARD, HENRY** (1843-1921), British geologist (see 28.804), died at Bushey, Herts., Sept. 6 1921.

**WOODWARD, HORACE BOLINGBROKE** (1848-1914), British geologist (see 28.804), died Feb. 5 1914.

**WOOL.**—The period under review (1910-26) witnessed very great upheavals in the wool textile trade of the world, resulting mainly from the economic and political changes produced by the World War. The trade has in essentials changed very little, if at all, in spite of the remarkable fluctuations in wool movements and in price levels, and even of the temporary reorganisation of the industries, both in wool-producing and in manufacturing countries, to meet abnormal circumstances resulting from the necessities of the World War. The tendencies discernible in pre-War years are isolating themselves from the temporary effects and dislocations of the War.

*Wool Statistics.*—The statistics of the wool trade, and more especially their inevitable limitations, the violent price fluctuations of the War and especially of the post-War periods, have caused almost impassioned controversy. Raw wool is not a "straight" article and its standardisation has not been found in general to be a practical proposition owing to the nature of the War material itself. Estimates of production in terms of actual fibre content are, at the best, rough estimates only. The wool production of the world, especially in those countries from which wool is exported, is, however, sufficiently accurately known and interpreted by the trade for all practical purposes. The incalculable factor is that of consumption, in regard to which all statistics are practically valueless, owing not so much to the expense and difficulty of collecting the statistics of world spindle consumption as to the enormous variations possible in the spinning of different counts of yarn, dependent upon fashion, and to the extent to which substitutes can take the place of virgin wool, dependent mainly upon price. These two factors of price and fashion react in a wholly incalculable manner upon the weight of new wool passing during any given period through machinery. To these factors should be added that of the machine capacity employed, dependent mainly upon the general prosperity of trade and the purchasing power expended upon clothing. Past figures of consumption, then, are, to a large extent, valueless as a guide to the future. Further, the returns of different countries differ so seriously as often to make it difficult to check imports into one country with exports from another. All statistical information must, therefore, be treated as suspect and subject to wide interpretation and inference. The tables on p. 1064 gives details about sheep and wool production, pre-War and in 1925.

*Production.*—As compared with 1911 there are now over 70,000,000 fewer sheep in the world, but this does not necessarily imply that wool production has decreased to the same extent—

## Sheep and Wool Production of the World

| Sheep          | Pre-War       | 1925          |
|----------------|---------------|---------------|
| North America  | 59,047,000    | 42,356,000    |
| South America  | 112,791,000   | 74,273,000    |
| Europe         | 179,432,000   | 164,236,000   |
| Asia           | 110,058,000   | 110,915,000   |
| South Africa   | 35,710,000    | 30,053,000    |
| Rest of Africa | 40,030,000    | 44,737,000    |
| Australia      | 85,097,000    | 83,083,000    |
| New Zealand    | 24,595,000    | 24,002,000    |
|                | 646,760,000   | 573,655,000   |
|                | lb.           | lb.           |
| Wool           |               |               |
| North America  | 332,320,000   | 282,429,000   |
| South America  | 588,350,000   | 443,773,000   |
| Europe         | 673,532,000   | 696,124,000   |
| Asia           | 273,146,000   | 250,320,000   |
| South Africa   | 165,888,000   | 185,000,000   |
| Rest of Africa | 53,806,000    | 62,265,000    |
| Australia      | 705,146,000   | 672,483,000   |
| New Zealand    | 198,474,000   | 208,269,000   |
|                | 2,990,662,000 | 2,800,663,000 |

e.g., in South Africa, where the number of sheep has declined, wool production has increased by 20,000,000 pounds. The world's raw wool production is now about 2,800 million lb., and before the War was about 3,100 million lb., three-quarters of which was suitable for clothing and the remainder for carpets, felts and very coarse materials. That proportion has now changed slightly in favour of wool suitable for clothing, owing mainly to the decrease in the wool production of Russia, a large part of which was of a coarse description. Of the wool used for clothing, about one-third is consumed in countries where it is produced, and the remaining two-thirds is the exportable surplus, which is the production considered hereafter and in most references to the subject. Of this wool the following estimate can be given:—

|                | Pre-war<br>(In Pounds) | 1925<br>(In Pounds) |
|----------------|------------------------|---------------------|
| British Empire | 1,069,508,000          | 1,065,752,000       |
| Australia      | 705,146,000            | 672,483,000         |
| New Zealand    | 198,474,000            | 208,269,000         |
| South Africa   | 165,888,000            | 185,000,000         |
| South America  | 558,350,000            | 443,773,000         |
|                | 1,627,858,000          | 1,509,525,000       |

Production has varied somewhat during the period in question owing mainly to drought in Australia. The post-War figures include a particularly heavy Australian clip for the season 1924-5. In all probability drought in Australia and New Zealand may in 1926 reduce not only the number of sheep but the weight and condition of the fleeces, which will be lighter and less well grown, resulting in 1927 in a reduction of wool grown by about one pound per sheep, or say over 100,000,000 lb. in all. The decline in production in South America still continues and is more permanent, arising as it does from the competition especially of cattle and also of wheat.

Of this exported wool slightly more than half consists of crossbred wool, and the remainder of the finer merino product, but this proportion is shifting more in favour of crossbred, owing largely to the fact that the crossbred sheep is grown for mutton while the merino sheep is not, and to the effects of closer land settlement in Australia, where the proportion of crossbred wool is about 37% compared with about 15% in 1916. We must expect, as a result, relatively higher prices for the finer merino wool than for the medium crossbred article, although this tendency may be counteracted by the greater attention given to the breeding and care of sheep in South Africa, where the weight and quality of the merino fleece is greatly improving. The French are also achieving success in sheep breeding in their North African colonies, whilst Japan is also establishing flocks to meet in part the increasing requirements of her growing manufacture. Appreciable success has also attended efforts to establish the merino sheep on the high tablelands of Peru.

*Distribution.*—The ultimate distribution of exported wool is an extremely complex matter to follow through, especially as its weight and form is often greatly changed before it reaches the spinner and weaver. Consumption varies from year to year, and importations by no means coincide with machine consumption. Consumption in Great Britain has remained fairly steady round

FIG. 1.—Diagram showing the world production of wool and the production in each of the principal producing countries for the annual average 1909-13, and for each year from 1920-5. The diagram is based on figures given in the weekly Commerce Report of the U.S. Department of Commerce, published by the Bureau of Foreign and Domestic Commerce. Every effort is made to obtain reliable figures, but in certain cases, particularly China, India, Turkey and Russia, only an approximate figure can be given, as no official figures are available. The section "Others" represents the production of all countries except those separately shown.

about 28% to 30% of the exportable surplus, whilst Europe, where France and Germany are the principal consumers, which before the War took about double the British consumption, is now consuming at least 10% less (excluding Russia), or say 54% instead of 60% on a somewhat lower supply basis. Both America and Japan are steadily increasing their imports of raw wool. Owing to financial stringency, European manufacturers' raw wool stocks have been below normal.

The relative decline in continental consumption is undoubtedly temporary, for every country, with the exception of Russia, has

increased, since the War, the capacity of her wool textile machinery. The industry of Alsace is of course now French instead of German. Italy in particular has increased her spindles considerably, and is extending her export of manufactures especially to Near Eastern markets. Japan shows great expansion not only in raw wool imports but particularly in wool cloth importations, this country being now the greatest wool cloth market of Great Britain. Japan and China have compensated in this respect for the temporary diminution in other markets, especially Europe and India. Most American wool import figures show extraordinary variations from year to year—e.g., in 1923 her imports of Australasian and South American wool were 334,000,000 lb., compared with about 80,000,000 lb. before the War. In the next year, 1924, the total fell to 122,000,000 pounds. At any time the incidence and extent of American demand may completely upset all forecasts concerning wool consumption. In the meantime, however, the growing expenditure on motor-cars has hit the textile industry in America very seriously.

#### THE WAR PERIOD

During the period of the World War the military demand of the Allied countries (the blockade effectually preventing Germany and her allies from obtaining any appreciable quantities of overseas wool) was more than balanced, until the last year of the War, by the extent of the cessation of continental demand. Even before the Allied Governments effected their various wool controls, merino wool, required almost exclusively by the civil populations of Allied and neutral countries, increased in price in a far greater ratio than did crossbred wool required for military clothing and other War equipment.

Shipping was gradually withdrawn from the long Australian route in favour of the short Atlantic passage. Large quantities of wool, amounting by the end of the War to almost 1,000 million lb., equal to one and a quarter Australian and New Zealand clips, accumulated at the ports in the Antipodes. The demand for finished goods for civilians had far outstripped the supply, and prices had risen sometimes to as much as 10 times the pre-War level. On the Continent of Europe supplies of finished goods had been absorbed and manufacturers operating reserves of wool for their machinery no longer existed. In the Central Empires the clothing of the military forces was well and efficiently carried out. By 1917 the new clothing issues were made almost entirely of old uniforms torn up into shoddy, and this was repeated and could have been repeated year after year. Meanwhile the German and its allied civil populations existed upon substitutes of every conceivable description, from fibres made from nettles and from seaweeds to jute and paper fabrics for both outer and under clothing (*see FIBRES; PAPER MAKING*).

The Allied Armies, and especially those of the British Empire, were exceptionally well clothed in wool, whilst later in the War the provision for the American Army was on a still more extravagant scale.

**Government Controls.**—All Governments involved in the War instituted some form of wool control. Early in 1915 the French Govt. had requisitioned its domestic wool clip on a basis of prices 25% over the pre-War level. In 1916 the British Govt. requisitioned the British domestic clip on a level of 35% over pre-War prices, whilst in Oct. arrangements were made by the Imperial Govt. with the Australian and New Zealand Govts. whereby their clips were purchased at 55% over the pre-War level. In 1917 the price paid to the British farmer was raised to 50% over the pre-War prices, and in 1918 to 60%. The original proposal had been to purchase merely the crossbred wool of the Empire, comprising practically the whole of the New Zealand clip of about 200,000,000 lb. and 15% of the Australian clip comprising less than 100,000,000 lb., but in the final negotiations the Prime Minister of Australia, fearing the possible financial peril for Australia as a result of untransportable and, therefore, unmarketable Australian products piling up at her ports, pleaded that the Imperial Govt. should purchase the whole of the clip and pay for it whether it was shipped or not. This was done on the basis of 55% over pre-War prices, with the stipulation that this price basis should be maintained for all military and other Government requirements both of Great Britain and of her Allies, but that in respect of civilian demands the fullest price possible should be obtained, and any net profit resulting should be divided equally between the Treasuries of the Imperial Govt. and the Governments of the Commonwealth and the Dominion.

During the first year of the purchase the Imperial Govt. paid out to the Commonwealth and Dominion Govts. about £25,000,000 and received for sales £330,000. By June 1918 it had paid out over £100,000,000 and received not much more than £50,000,000. Up to the end of 1919 the Imperial Govt. had expended many millions sterling more in the purchase of wool than it had received. The Australian brokers and wool growers reorganised the collection and distribution of wool on the new system of appraisement in Australia in a most remarkable and rapid manner. A large part of the South

African clip was also purchased, as well as the production of the Falkland Islands and of Iceland. Numerous schemes were considered for acquiring the wool of South America, but all were vetoed by the Treasury, mainly owing to exchange complications. In England an organisation was rapidly improvised by the War Office, which, in co-ordination with the trade, dealt with all this wool, and by a progressive control of the industry not only met the whole of the requirements of the Army, of the Navy and of the Air Force, but in addition a large proportion of the requirements of the Allied Armies, including, later in the War, the total equipment in Europe of the forces of America, to say nothing of hundreds of semi-official organisations, such as the Red Cross, Relief Organisations, Post Office, Police, Prisoners of War, Women's Organisations, etc., as well as the Indian and Egyptian services and the initiation and control of standard clothing schemes for the civil population and for demobilisation after the War.

The reason for the colossal wool purchase, of 9,895,000 bales, which included the period of the War and one clear wool season after the War, and on which almost £300,000,000 sterling was spent and a net profit of £70,000,000 sterling made, was to ensure military supplies. In fact, the first consideration was the securing of supplies for all purposes at a known price no matter how long the War continued, and, secondly, securing control in Imperial hands and the means of bargaining which the ownership of such a commodity gave in times of war. In its main objectives the purchase proved to be very successful, and provided a basis of raw material costs on which all subsequent costs and prices paid were based, resulting in more rapid production and the saving of many millions sterling to the Exchequers of the Allied Governments. The aggregate sales of British wool amounted to £40,000,000, on which a profit of £5,000,000 was made.

#### THE PERIOD AFTER THE WAR

In 1919 the state of uncertainty resulted in a temporary cessation of buying and a fall in prices. The British Govt., which at that time was issuing wool at fixed prices, based on a good quality 64's top at 69d. per lb., guaranteed to continue this issue till Nov. 1919. In fact fixed issue was discontinued some months earlier. Manufacturers were, however, anxious to regain their old trade connections, and preferred to resume, as far as possible, their pre-War wool connections and to buy untrammelled by any Government formalities or restrictions, with the result that they bought at even higher prices in the open market in order to secure a greater freedom of action and of contracts.

The wool textile machinery of the Allied countries was, as it happened, situated near frontiers, and had been largely destroyed, notably in the Nord department of France, in Northern Italy and in Poland, with the result that the production of the Allied textile industry outside Great Britain was very largely reduced for a period of two years after the War. The War-time control of the textile industry was speedily liquidated (March 1919). During the first 18 months after the War trade boomed as never before, and Europe poured in orders at any price. Whereas in 1913 Great Britain had exported about 40,000,000 yd. of wool cloth to Europe, at a value of about £6,500,000, in 1919 the exports to the Continent amounted to 120,000,000 yd. of a value over £50,000,000. To the rest of the world Great Britain exported 40,000,000 yd. only, as compared with 120,000,000 yd. before the War. The position had therefore been exactly reversed, and during the first few months of 1920 the extraordinary diversion of export and increase of price was accelerated.

The boom which was experienced was due to many causes. The censuses taken during the War by the British Wool Textile Department revealed large unsuspected stocks held by the industry as its normal reserve, the effect of which before the War was undoubtedly to minimise price fluctuations. The War destroyed that reserve in Europe and in most other parts of the world, in whatever form it then existed. From every quarter, therefore, an insistent demand arose. The whole world, impoverished as it was, over-bought and over-traded, and an edifice of trade was built up which collapsed before another 18 months, the sudden and wholly unprecedented slump in prices corresponding to the unprecedented and abnormal rise. Lack of finance dominated the situation.

**Prices.**—A comparison of prices of a commodity over a period of years is a fair indication of the position of the trade concerned. The highest price for 64's merino wool tops in the Boer War boom was 33d.; during the boom following the World War the price

reached, by April 1920, the record of 161d. per pound. Within a month of this peak price, and without warning, a financial crisis started in Japan, and, travelling via America to Europe, overwhelmed the trade, which did not recover for two years at least. Recovery was materially assisted by the fact that the bulk of colonial wool supplies was held by the Imperial Government. All their efforts, however, could not stem the tide of declining values.

In 1921 a company, called the British Australian Wool Realisation Association (B.A.W.R.A.), was formed to realise the huge stocks of Government wool without the restrictions and international complications which direct Government control involves, and especially without the political interference which had been absent during the War but asserted itself in time of peace. By this time the initial cost of the clips had been practically met, and the cash realisations constituted very largely the profits made on the whole transaction jointly by the Imperial and Dominion Governments. No wool was sold save at reserved prices, and gradually the surplus in the hands of B.A.W.R.A. was released, having regard to the power of absorption of the trade and the new supplies coming forward from growers. Undoubtedly the policy pursued maintained prices on a level which would otherwise not have been possible and to this extent the organisation was the saviour of the trade. Many failed to recognise that ultimately the financial resources of the world to absorb wool and to purchase woollen clothes were limited by price.

Many proposals to perpetuate the B.A.W.R.A. form of organisation for the wool trade in the hope of maintaining prices for growers on a high level have been made. The general sense of those concerned was, however, against these proposals, and as the market was absorbing supplies satisfactorily little was heard of them. Prices advanced gradually until, by the end of 1924, they were between two and three times the pre-War price, heavy buying taking place on the prediction that the statistical position revealed an undoubted shortage of wool. The vacuum in the world demand for wool textiles had, however, largely been filled, and at the new level of prices consumption decreased. Demand for wool withered away, and substitutes were obtainable at a cheaper price.

During the first six months of 1925 prices fell by 50%, and another minor slump disturbed the equilibrium of the trade. Raw wool was now on a price level even lower than the general cost of living, and as a result demand increased and a healthy consumption of wool was resumed. The Far Eastern demand was dislocated as a result of serious earthquakes and devastation in Japan and of civil war and foreign boycott in China, the American market was quiescent and the main incidence of demand was concentrated in Europe, where, in spite of financial stringency and low purchasing capacity, the wool of the world is being absorbed at a steady rate. As world trade increases and the general economic and financial conditions improve, the main problem of the trade will be to obtain adequate supplies of raw wool at a reasonable price. (see AUSTRALIA; INDUSTRY, CONTROL OF; NEW ZEALAND.) (E. F. H.)

**WOOLLEY, MARY EMMA** (1863– ), American educationist, was born at South Norwalk, Conn., July 13 1863. She became a teacher, and was instructor in Wheaton Seminary, Norton, Mass., 1886–91, before going to Brown University where she graduated (A.B., 1894; A.M., 1895). She was teacher of Biblical history in Wellesley College, 1895–8, becoming in the latter year professor and head of the department of Biblical history and literature. She was appointed president of Mount Holyoke College in 1900 and in that capacity became one of the most influential women educationists in the United States. She was the author of several monographs, including one on the *Early History of the Colonial Post Office* (1893).

**WOOLWORTH, FRANK WINFIELD** (1852–1919), American merchant, was born near Rodman, N.Y., April 13 1852. He studied in the public schools, and graduated from a business college at Watertown, N.Y., in 1872. He began his career as a clerk in Watertown. In 1879 he opened at Utica, N.Y., his first "five cent" store which, however, was a failure. Later in

the same year he established a "five and ten cent" store at Lancaster, Pa., followed by another at Harrisburg. The chain was extended till it covered, in 1924, 1,356 "five and ten cent" stores in the United States, Canada and England. When the F. W. Woolworth Co. was incorporated in New York in Dec. 1911, he became president. In 1912 the Woolworth building in New York City, costing \$13,000,000, was completed from the designs of Cass Gilbert. It is 760 ft. high, has 57 storeys, and, excepting the Eiffel Tower in Paris, is the tallest building in the world. The gross sales of the company in 1924 amounted to \$243,203,459 and the net income \$24,601,764, as compared with \$119,496,107 and \$10,361,557 respectively in 1919. Woolworth died at Glen Cove, L.I., April 8 1919, leaving an estate appraised at \$27,000,000.

**WORCESTER, Mass., U.S.A.** (see 28.822), increased by 13.1% in the 10 years after 1910, reaching a population of 179,754 in 1920, of whom 53,527 were foreign born; in 1925 according to the state census it was 192,242. The output of its diversified industries was valued at \$77,148,000 in 1909; \$208,706,000 in 1919; about two-thirds as much in 1921; and \$212,043,158 in 1923, when there were 544 establishments within the city limits, employing a force of 36,449 wage earners. The combined resources of the five savings banks, two national banks, two trust companies and four co-operative banks was \$206,526,000. Worcester has never had a bank failure. By 1925 over \$10,000,000 had been spent on the waterworks, which included both a high and a low service system; about \$8,000,000 on the sewer system, including a sewage purification plant which cost \$1,284,208; the equipment of the police department and of the fire department had been motorised; a comprehensive city plan had been prepared; zoning ordinances had been adopted; a beautiful new bridge had been built across Lake Quinsigamond. A trade school for boys was founded in 1909 and one for girls in 1911.

**WORKERS, EDUCATION OF.**—Since 1910, in spite of the intervention of the World War, this movement has developed with rapidity especially perhaps in Great Britain and the United States. In many countries the old movements persist, such as the Danish People's High School Movement and the English Workers' Educational Association. The former, in its democratic aspect at least, was inspired by Bishop Grundtvig (1783–1872) and demonstrated practically by Kristen Kold, shoemaker (1816–70), whilst the latter was the result of a fusion of English 19th century effort and experience. Both derived their power from their recognition of education as a fundamental force in life which must permeate and illumine every activity of man, as a continuous correspondence with a law of life, not a means to the achievement of any ulterior, though legitimate, purpose. Their ideal was the increase of thinking men of action in all the institutions of a truly democratic community. "Field, factory and workshop," cathedral, town hall, parliament and university were alike to be the beneficiaries of their activity and so they proved to be.

In all countries their effect on "Workers' Education" can be traced. Each country must, however, create its own institutions, yet the post-War Volkshochschule movement of Germany, the Arbetarnes Bildningsförbund (Workers' Educational Association) of Sweden and the Workers' Education Bureau of United States of America have assumed their characteristic shapes partly at least as the result of their influence.

**General Importance.**—As a direct result of the demand of working men and women, adult education has become a living issue, particularly in Japan, many European countries, England and the United States of America. In England the rise of specific adult educational movements is the immediate consequence of a post-War limitation of aim on the part of the Workers' Educational Assn., and the rise of a partisan National Council of Labour Colleges which directs its efforts towards intellectual preparation for the final victory of the proletariat in an unrelenting class war. In 1925 a joint agreement was made by these two bodies with the Trades Union Congress, but they operate on different planes, and are only alike in their adoption of the terminology of educational method.

*The W. E. A.*—The Workers' Educational Assn. (2,500 affiliated bodies and 23,000 independent members) organises its classes in co-operation with universities, the state and local authorities. The maintenance of this alliance is indeed its *raison d'être*. The chief result of its effort is the system of University Tutorial Classes which operating throughout Great Britain and the Dominions and, to a less degree in the United States of America and elsewhere, has made it possible for many workers to participate in the highest form of university extramural effort and in the internal work of universities and colleges.

*Political Basis.*—There is a marked tendency for the various institutions and movements scattered throughout the world to be organised on the basis of political bodies and to serve their ends. The International Conference on Workers' Education held in 1922 at Brussels in the Belgian Labour College, and, in 1924, at Oxford, in Ruskin College, reveal this tendency, yet there is obvious anxiety not to exclude such bodies as are organised for purely educational purposes, provided they admit the theory of "workers' control" into their constitutions.

The area of workers' education, when all is said and done, is still largely unoccupied. It has not invaded the technical and industrial field. There are those who argue, as apart from politics and pure culture, that its business is, in the first place, to develop men and women who can construct and control industrial processes and direct commercial expansion. Then, again, certain occupations segregate their workers, notably in the case of workers on ships, but in England a Seafarers' Education Service has been established which operates largely through the efficient provision of books and advice (see LIBRARIES).

*Situation in U.S.A.*—Some 50 trade union and Labour colleges are dotted about the United States. The Rand School of Social Science (1906) and the Boston Trade Union College (1921) are among the earliest and most notable examples. The Brookwood Workers' College (1921) is the pioneer residential institution. Ten Colleges were represented at the Third National Convention of the Workers' Education Bureau in 1924. Certain colleges have summer schools for workers. Bryn Mawr (1920) for women workers has been a consistent success.

*Situation in England.*—There are several residential workers' colleges in England. Ruskin (1899), Fircroft (1909), Avoncroft (1925) for agricultural workers and Beckenham (1920) for working women, whilst the Conservatives have Stott College, the Socialists the Labour College. Moreover, there is talk of a Labour university at Easton Lodge under the direction of the Trades Union Congress. The co-operative movement, which has undertaken educational work since 1842, has established a college in Manchester. Most of the universities organise summer schools (*q.v.*) for workers. The majority of the other experiments merge into the general adult education movement.

**WORKMEN'S COMPENSATION:** see INSURANCE, SOCIAL.

**WORKS COUNCILS.**—In all industrial countries political democracy has been accompanied by a movement towards democracy in the relations between labour and capital. Historically the trade unions were the first to appear in this field and they have been followed by representative organs of the employees in the individual establishments. Statutory representative bodies existed in many countries before the World War in the mines, where they co-operated in the prevention of accidents. During the War the bargaining strength of labour was greatly increased, and in a number of the belligerent countries, especially in Germany and Austria, the mobilisation of the civilian population for work in the munitions industries led to the creation of statutory works committees, and provision was made for the settlement of disputes between these bodies and their employers by the setting up of conciliation tribunals composed of equal numbers of employers and employees with an impartial chairman.

The revolutions in Russia and in Central Europe brought with them the idea of making works councils the basis of a political organisation of the state. While in Russia this idea was to some extent realised and the councils were at the outset given the control of businesses as a step towards socialisation, the new Central European republics (Germany, Austria and Czechoslovakia) rejected both the political attributes of the councils and the Russian method of socialisation through individual businesses. In these countries the War-time legislation was extended on the following lines: firstly, co-operation of the employees, on equal terms with the employers, in the regulation of working conditions by means of elected representatives, subject to the priority of collective agreements; secondly, the councils to have advisory functions in regard to problems of management, with the aid of certain rights as to information, and other matters.

### I. THE GERMAN WORKS COUNCILS ACT

*Legal Provisions.*—The German Works Councils Act prescribes the erection of works representative bodies in all establishments with 5 or more employees; in establishments with 5 to 19 employees representation is by single individuals (the works steward), and above 19 employees by works councils with a minimum of 3 members, but rising with an increasing number of employees to a maximum of 30 members where 15,000 or more persons are employed. Following the distinction already existing in the trade-union movement and in social insurance, the works council is divided into two sectional councils of wage-earners and of salaried employees, the membership of which is proportional to the number of employees in each section, though with a certain minimum representation of the minority section. These two sectional councils are each exclusively competent to deal with matters affecting the interests of its own section, and it is only when they come together that they constitute the works council representing the general interests of the whole body of employees. The type of establishment is immaterial—all private, state and municipal establishments, commerce, industry, banks, agriculture, etc., come under the Act.

In general, every establishment must have its own works council, and there is no provision for a common works council for undertakings which have establishments in more than one district, *e.g.*, the Deutsche Bank or the firm of Siemens. But in the case, for instance, of the Berlin branches of the Deutsche Bank, or the municipal establishments of the town of Berlin, the individual works councils can in each case elect from their numbers a central works council (*Gesamtbetriebsrat*) to represent their joint interests. The only exception to this local restriction of the statutory association of works councils (which was imposed in the interests of the trade unions in order to prevent the growth of an independent organisation of works councils) is provided by the large undertakings of the Reich and the provinces. In the railways and the post office each local establishment has its own representative body; the whole of the employees in each administrative district then elect a district works council, and, finally, all the employees in the whole of the railways (or the post office) elect a central works council. The election to each of these bodies takes place on the same day throughout the country.

The election of the works steward takes place by the majority vote of all employees with voting rights and that of the works council by the method of proportional representation with secret ballot (those entitled to vote must be not less than 18 years of age; those eligible for election must be not less than 24 years of age, have been in the establishment for six months and in the occupation for three years). The period of office is one year. The council must have a chairman and vice-chairman, and if it has more than eight members it must elect a committee of five, in which certain confidential matters enumerated in the Act must be discussed. Under the Act the council must hold its meetings as a rule out of working hours. The employer can only attend if he has been specially invited or if he has himself summoned the meeting. The necessary free time required

and expenses incurred by the council (rooms, writing materials, texts of the Act, etc.) must be provided by the employer at his cost. The office of works councillor is honorary and unpaid but out-of-pocket expenses and any working time unavoidably lost must be paid for by the employer. The works council is not allowed to make any levy on the employees (this is not so in Austria).

There is no legal obligation to accept the office of works councillor, and it can at any time be resigned. In the case of gross abuse of office a councillor can be compelled to retire, or the whole council can be dissolved, by order of the local Labour Court (composed of an equal number of employers and employees with an impartial chairman). The works assembly consists of the whole body of employees, which can be convened by the employer, or one-fourth of the employees, or in general at the discretion of the works council. It can only present requests and proposals to the council; in particular it has no right of "recall," though this was strongly demanded by some sections of Labour when the Act was under discussion. In the inflation period the works assemblies played a great rôle, but their importance has diminished since the stabilisation of the currency.

On the resolution of one-fourth of the members of the council representatives of the trade unions represented on the council can take part in an advisory capacity in its meetings and also, without such a resolution, in the works assembly.

The functions of the works councils are indicated in the first paragraph of the Act. They are: (a) "to safeguard the common economic interests of the employees in relation to the employer," and (b) "to support the employer in carrying out the aims of the business."

(a) The function of safeguarding the interests of all employees of both sections is entrusted to the works council, while those matters which concern only one section fall within the competence of the sectional councils of wage-earners or of salaried employees—a distinction which is very important because collective agreements between trade-unions and employers are normally concluded separately for wage-earners and for salaried employees. This function consists chiefly in the supervision of collective agreements and in the regulation, together with the employer, of working conditions in the individual establishments which are not settled by the collective agreements. In the event of infringement of a collective agreement the works council (or steward) has not independent power of intervention; if negotiation with the employer is fruitless it can apply to the trade union which has concluded the agreement. Alternatively, it can advise the individual employee to bring an action against his employer in the Labour Court.

The so-called "works agreement" (*Betriebsvereinbarung*) dealing with matters not regulated by the collective agreement (*Tarifvertrag*) is of considerable legal and social importance. Akin to the collective agreement in that it is also chiefly concerned with defining the context of the individual labour contract, it is distinguished from the former because it is concluded, not between trade-union and employers' organisations but between the works council or steward on the one side and the individual employer on the other. The works agreement has no legal status, a fact which has given rise to much controversy in recent years. The employers in general are in favour of giving legal effect to works agreements (as is already the case with collective agreements) but the trade-unions are against it because they see in the proposal a danger to the collective agreement. In practice this danger has so far not materialised. The most important sphere of the works agreement lies in the drawing up of working rules (*Arbeitsordnung*) which are legally compulsory in the larger industrial establishments and which, prior to the Works Councils Act, had been issued by the employer alone. These working rules (which deal with such matters as the division of working time, the method of wage payment, fines for late arrival, etc.) must now be drawn up jointly with the works council and the signature of both parties appended. If an agreement cannot be arrived at by negotiation, either party can appeal to the Conciliation Board (referred to above in connection with War-time legislation). If the mediation of the board is unsuccessful it is empowered to establish definitive working rules which are binding on both parties. This constitutes perhaps the most important democratic transformation of the old autocratic conditions of employment in works. It is further the duty of the councils and stewards to protect the disabled, to work for good relations amongst the employees and between them and the employer, to safeguard the freedom of association of the employees, and to co-operate in the administration of works welfare institutions. The employer must notify the councils as early as possible of his intention either to take on or to dismiss relatively large numbers of employees in order that unnecessary hardship may be avoided.

The right of the council to co-operate in the protection of individual employees against dismissals which are socially undesirable

is of great importance in practice. The legal period of notice of dismissal for the wage-earner varies from one day to two weeks, while the salaried employee as a rule is given monthly or quarterly notice. An employee to whom notice is thus given can, through the works council, in whose hands a great deal of power is thus put, appeal against dismissal on the grounds, amongst others, that he has been dismissed because of his trade-union adherence, or because "the dismissal constitutes an unjust hardship which neither the conduct of the employee nor the circumstances of the business can justify." The decision rests with the Labour Court referred to above. If it allows the appeal the employer can choose whether he will re-engage the employee or will pay him a sum in compensation, which is fixed by the Court in accordance with the number of years during which the employee has been in the business, up to a maximum, for six years or more of employment, of one-half of his total earnings during the preceding year. In 1924 45,000 disputes over dismissal came before the Labour Courts. It is proposed later to grant protection against dismissal to all employees and not merely to those in businesses with a works council.

Works councillors receive a greater degree of protection against notice of dismissal, which only becomes valid in their case if a majority of the works council vote in favour of it (in the case of works stewards a majority of all the electing employees is necessary). If consent is then refused the employer must appeal to the Labour Court, whose decision is final. The consent of the Court is practically withheld, not merely if it considers that the grounds adduced would not justify the dismissal of an ordinary employee but if it holds that the interest of the employees in retaining the councillor is greater than that of the employer in dismissing him. In practice the protection afforded to the councillors has proved thoroughly effective. The protection given by the Act applies to individual dismissals and not to mass dismissals rendered necessary by trade depression. Finally, the works council are called upon to co-operate with the factory inspectors and other officials in the prevention of accidents and the promotion of works hygiene. This opens a wide field of activities to the councils in which they are increasingly making their influence felt.

(b) The advisory functions of the works councils are designed to stimulate the feeling of responsibility and the pride of work of the employees. The councils are required by the Act to do their utmost to increase the efficiency of management, and it is their duty also to assist in the introduction of new labour methods. For this purpose they are granted access to the wages lists of the concern in which they are employed and to other information in the possession of the employer which concerns labour conditions. The employer must make a quarterly report on the economic position of the undertaking and of the industry and on the anticipated labour demand. Further, in all establishments employing upwards of 300 wage-earners or 50 salaried employees the employer must lay before the council a balance sheet and profit and loss account in respect of the business, and must explain the different items. Strict secrecy must be observed by the council in regard to any confidential disclosures made by the employer.

The Act goes even farther in empowering the works council in every company to elect two of its members to sit on the Control Board (*Aufsichtsrat*) of the company with full voting rights. In practice the intention of the Act has been largely evaded by the action of the Control Boards in transferring most of their functions to the management of the company, and confining their activities to the legal minimum of supervision, auditing etc., laid down by the Commercial Code.

## II. THE OPERATION OF THE ACT

It is still extraordinarily difficult to form a comprehensive judgment on the operation of the Works Councils Act. In small businesses representative bodies are often not elected, but in the medium-size and still more in large undertakings works councils certainly exist, though in many cases no salaried employees' council is elected owing to lack of interest. The distinctions between large and small towns and between town and country and the strength of trade-union organisation, also influence the extent to which the legal rights under the Act are exercised. In the absence of official statistics certain trade unions give figures of the numbers of works councillors. Thus in 1922 there were 32,565 wage-earning and 5,615 salaried employees who were members of workers' representative bodies in 11,557 establishments in the metal industries. In the same year there were 25,239 works councillors in 7,219 establishments in the textile industries. In the whole German mining industry there were in 1925 5,428 works councillors, of whom 2,944 were in the Ruhr district.

Neither the exaggerated hopes with which the workers regarded the passing of the new Act nor the equally exaggerated fears of the employers have turned out to be justified. At the

outset there was a great deal of friction and an enormous number of appeals to labour tribunals, often over very insignificant matters. But in the course of time things have settled down and the procedure, etc., is now fairly well established. The employers, especially in the stormy inflation years, have learned to appreciate and make use of the councils as a valuable intermediary between the management and the employees; the councils have more and more assumed the necessary, though at the moment thankless, rôle of joint responsibility with the employers. Many a works councillor at the end of his term of office has refused to stand again for so thorny a post or has not been re-elected by his dissatisfied fellow workers, but many have continued in office for more than six years, and have learned how to defend effectively the interests of the employees, and have gained an insight into economic conditions such as was quite foreign to the earlier generation of trade unionists. It is agreed by most German observers that the works councils have justified themselves not merely as representative of the interests of their class but also as valuable organs of social peace in factories and businesses. On the other hand, it must also be recognised that their activities in an advisory capacity and their influence on management are still very slight, partly owing to the opposition of the employers, partly to the insufficient capacity and experience of the works councillors, and partly to the abnormal conditions due to the inflation and subsequent stabilisation of the currency. It will only be after years of normal economic conditions, when the wage question is no longer the chief concern of the councils, that an objective judgment on their economic functions will be possible.

The relations between the works councils and the trade unions deserve special mention. During the first years of the Act there was a vehement conflict between the two forms of organisation for the leadership of the labour movement—a fight which was finally decided in favour of the unions which have succeeded in incorporating the councils within their organisation. The elections to the councils are in practice completely controlled by the trade unions. While the danger of a split in the trade-union movement can be definitely regarded as past, the councils have undoubtedly strengthened the tendency towards the formation of industrial as opposed to craft unions and have increased the solidarity of wage-earning and salaried employees. Finally, the works councils have had an important influence on the growth of workers' education. Several state institutions such as the Academy of Labour at Frankfurt and the School for Economics and Administration at Düsseldorf owe their origin to the Works Councils Act. A great stimulus has also been given to trade-union schools and classes, and by special newspapers and supplements to trade-union organs an active educational work is being carried on.

### III. THE MOVEMENT IN OTHER COUNTRIES

Both in Austria and Czechoslovakia Works Councils Acts have been passed; in the former on May 15 1919, and in the latter on Feb. 25 1920 (for mines) and on Aug. 12 1921 (for other establishments). The Austrian Act served in large measure as a model for the German Act and the latter as a model for Czechoslovakia. The experience of the working of these Acts is similar to that of Germany. It is noteworthy that the Czechoslovakian Act for mines contains a profit-sharing scheme for the workers.

In Norway a provisional Act was passed in 1920, but both the scope and the functions of the representative bodies created by it are far less extensive than is the case in central Europe.

In Russia the Labour Code of Nov. 15 1922 pushed the works councils very much into the background and subordinated them completely to the trade unions. Setting aside the divergent economic structure of Russia it appears that their functions are less important than those of the works councils in central Europe.

In France, apart from certain War measures, the movement has not gone beyond an exchange of views between the employers' organisations and the trade unions in the metal industries.

The occupation by the workers of a number of engineering factories in north Italy in 1920 led to proposals by the Govt. to establish statutory representation in the works, but this development was brought to an abrupt end by the success of the Fascist movement.

In England, joint works committees, composed of representatives of the employers and the employees, have been set up in some industries under the Whitley scheme, but only to a relatively small ex-

tent. Works councils have also been set up voluntarily with considerable success in a number of large undertakings such as Messrs. Cadbury, Hans Renolds, etc.

In the United States and Canada works councils of various sorts have been established by the employers in a good many undertakings, mostly with the intention apparently of counteracting trade union influence. Their effects on relations between the employers and employees are very favourably regarded, at least by the employers. (Cf. esp. Leitch, *Man to Man*.)

The most comprehensive investigation into conditions outside Germany is to be found in the book by the Dutch writer, Van den Bergh, which is referred to in the bibliography.

**WORLD RECOVERY.**—He who would serve his generation, must be in advance of it, and although life has proved that "the executioner is always waiting for the forerunner," the present writer still holds that he who would help his fellow men can only do so in a real sense if, when he sees clouds rising in the distance, he points out untiringly and at no matter what cost to himself how they may be dispersed. It is a thankless and dangerous rôle. Mankind has always hated the prophets of disaster. And they were prophets of disaster who cried in the years before 1914 that there was danger of a world-conflict, and that Europe ran the risk of perishing in the tempest.

### I. THE FAILURE OF THE OLD WORLD

Was it, however, so hard to see clearly? Was it so hard to see that capitalism, which has been and is such a wonderful instrument of material progress, but, up to the present, has been little more, had wrought a change in the civilisation which grew out of the Renaissance? The preoccupation with gain and the craving for pleasure have come to be first in men's minds, relegating to the second place the desire for freedom and high thinking which was so deeply imprinted on the great movement of the 16th century. This waning of an ideal would have been partly compensated and would at all events have been but temporary, if the economic transformation brought about by the great inventions had found their corollary in a wise organisation of the production and distribution of wealth. But nothing of the kind took place. Owing, perhaps, to its excessive rapidity, the evolution of industry only led to a feverish haste in production—men striving with all their might to produce goods in order to increase and heap up profits, buying up raw materials, and seizing every opening, ready to make war against all rivals! Such was the spectacle presented by a disorganised economic world at the beginning of the 20th century.

Not that there had not been some efforts to reduce it to order; but the efforts were usually brief, often wrongly directed, and always inadequate. In most countries the larger industries had endeavoured to amalgamate; and to this end their representatives had demanded, and in nearly every country on the continent of Europe had obtained, measures of protective legislation. Entrenched behind tariff walls, they had succeeded fairly well.

though in degrees varying with local conditions, in co-ordinating their internal activities. But practically nothing had been done in the matter of external competition. Nay, protection, by shifting the ground of economic struggles, had also altered their character and increased their intensity; it lessened the rivalry between the scattered producers of the same nation, but led to collective conflicts which increasingly took on the character of national conflicts between the industrialists of different countries, who draped themselves in their national flags.

War between the nations whose interests were mutually threatened and threatening thus became inevitable for want of a forcible imposition of order and method, which would have been strongly resented by the business world, lulled on the comfortable cushion of the *status quo*. This state of inane optimism, moreover, prevented any belief in the words of those who foretold the coming of a terrible cataclysm. The business world replied complacently that the war would not last long, and that as it would provide an opportunity for liquidating stocks it should inaugurate a new era of prosperity. This narrowness of outlook, which was the main attribute of most of the politicians as well as of the great majority of the industrial leaders of the period before 1914, persisted while the conflict raged. The voices of those who urged that events should be utilised to ring down the curtain on the War, or at least to make the attempt, were simply stifled. At times it seemed as if men, seized with giddiness, did not even see the gulf into which Europe was plunging.

Salvation came from the New World. The old continent was rescued by its former colonies. The entry of the United States into the War had, almost at once, a considerable and infinitely beneficial effect, which more than compensated for the inconveniences arising from the intrusion of a young nation which had grown up overseas into the old civilisation from which she was descended. America put an end to the War which, but for her intervention, would have been prolonged for months, perhaps for years. The misfortune was that when the bugles sounded the "Cease fire" peace was not made: papers were signed, and that was all.

Yet how could it have been otherwise? Everywhere in greater or less degree governments had fanned the spirit of destruction in their peoples, had been at pains to propagate and foster it instead of striving to curb and modify it. The hysterical mentality which they had helped to create could not cease with hostilities. It was bound to survive them and to be reflected in the treaties. Thus, at a time when complete unanimity of effort was urgently needed for reparation and reconstruction, the enactments made at Versailles and elsewhere kept alive—nay, multiplied—causes of economic friction, aroused rather than ended financial dissensions, and brought no political relief except by decreeing the cessation of slaughter.

## II. THE RUSSIAN CATASTROPHE

Before considering the situation of Central and Western Europe let us look at the great wound inflicted by the Russian Revolution and the dangers involved in it.

How stands the former empire of the Tsars? It abandoned, indeed, the ill-considered communism which, whether or not the discovery pleased them, the men who seized the reins in 1917 soon found was not merely harmful but also ridiculous; but it evolved slowly but surely in the direction of a state socialism which, so far as could be gathered from the confused and contradictory reports that reached the West, daily approached nearer to capitalism. An economic rapprochement between Russia and the West remained, however, far off, and indeed, could not take place until the Soviet Republic consented to adapt itself to the political conditions of Europe.

Moscow became the scene of a struggle between what may be called "Europeanism" and what is known there as "Scythism." Scythism, which achieved the miracle of rallying to the Bolshevik standard the Russian reactionaries who were most violently opposed to it, inculcates scorn and hatred of western civilisation, and aims at nothing less than Asia's vengeance on Europe.

The triumph of Scythism, if it were to come about, would be big with consequences. One portion of Europe would be welded to Asia and would revert to the mediaeval methods of production and distribution which have become stereotyped in China or Mongolia. On the political plane the danger would be even greater. The path would be clear for a future collision between East and West, and though it is more than probable that the West would conquer—the days of Genghiz Khan and Tamerlane are over—it is greatly to be feared that a new upheaval would sound the final knell of our civilisation. In order to avoid this immense disaster—the defeat of the Moscow extremists lessened the danger but did not remove it, for words are cheap and aggressive nationalism is tenacious and lasting—the European nations which control parts of Asia must be told again that it is necessary to adopt a conciliatory policy, modifying the laws in favour of the natives and gradually introducing measures of autonomy. Above all it is important that Europe should recover the full economic and political strength which enabled her in the past to make the first attempts to introduce order and progress into Asia, that strange continent which is at once somnolent and anarchic.

## III. CENTRAL AND WESTERN EUROPE

But what is the condition of Europe? We must see things as they are. Central Europe is unstable politically, and is only beginning to recover economically, while the victorious States of Western Europe are suffering from the same evils as the vanquished, their sole advantage being that the degree of the suffering is less.

Take first the economic situation. It is a curious one, and shows surprising contrasts in the respective conditions of Great Britain and France. Great Britain's financial health is magnificent, but she is suffering from economic diseases—(the word is used deliberately, disease being transient). She is (1926) suffering cruelly from unemployment, and some of her chief industries are in a perilous state. France confronts her, economically prosperous, justly proud of her splendid agriculture, on the highway (or apparently on the highway) to become a great industrial power, but alas! in a state of extreme financial "poverty." What is the reason of this violent contrast in the position of two nations which are such near neighbours and are similar in so many respects?

The post-War history of Central Europe, and particularly of Germany, which is in the main a story of successive financial and economic crises, makes it possible to realise more fully, and to analyse more accurately, the present condition of France. In 1919 and 1920 the Minotaur of war had devoured the produce and reserves of provisions and wares in the Central Empires, while the blockade prevented any re-provisioning from without. When external communications were restored, they were utilised not so much for the re-equipment of Central Europe as to transfer by means of investment abroad the wealth which its German possessors feared might be laid under forced contribution as a result of their country's defeat. Nevertheless, a year or two later, in 1921 and 1922, the German factories were humming again; the forges, blast furnaces and steel works of the Rhineland were working at full capacity; the textile manufacturers were overwhelmed with orders and the number of unemployed fell to an insignificant figure. And the press of Western Europe declared that Germany's economic condition was most prosperous, that under the direction of a handful of economic dictators she was on the way to becoming a "giant" (this was the expression of a British newspaper). Those who fed the public with these hasty conclusions scarcely condescended to note the fall of the exchanges and the disastrous effect of the monetary depreciation on people with fixed incomes.

A new reel of the economic film was then unrolled, and is still (1926) in process of unfolding. The rulers of the Reich, being forced to put a stop to the downward rush of the mark, which would soon have made existence impossible—resolved to wipe out the internal debt, whether represented by bonds or in kind, at a stroke. They set up a new monetary system on the gold basis.

And thereupon furnaces were extinguished, looms ceased work, unemployment multiplied, and ruin overtook the industrial dictators whose insolent fortunes had sprung up like poisonous fungi. The financial crisis gave place to an economic one.

The explanation, people will say, is simple; ebb and flow were alike due to the upsetting of the exchange. It is easy to maintain this argument by showing that when the exchange of a country falls there is a longer or shorter period during which wages do not rise in the same proportion as the value of money falls. During this period the manufacturers reap the benefit of the premium on exports which increases in proportion as the value of the paper currency falls. This results in a frenzy of production, and the extension and the creation, even, of factitious industries among the nations with ruined currencies. Naturally the nations with healthy currencies are much injured by the species of aggression which is in fact a new kind of "dumping," "dumping by exchanges." Their finances are stable but their economic life is shackled.

Abnormal conditions, however, cannot last very long. There is an inevitable limit to a falling exchange. It is reached when whole classes of the nation are on the verge of abject ruin and a social catastrophe in sight. There is then no choice but to pull up suddenly. Either the currency must be demonetised as it was in Germany, or it must be stabilised as it was in Belgium. In either event, the bonus on exports which was sustaining the factitious or swollen industries disappears forthwith and a crisis occurs, more or less serious according as whether wise measures have been taken to meet it or not, so that the nation has escaped a financial slough only to be engulfed in industrial penury, the completeness of which varies with the economic and political organisation of the country.

The above is a true picture we believe of the economic and financial phenomena which we are now able to observe at leisure; but although they are registered, expressed and proclaimed aloud by the movements of the exchanges these movements do not cause them, as is the popular belief. Monetary depreciation is merely the symptom of the disease in the organism; it is an effect and not a cause.

#### IV. THE CAUSES OF EUROPEAN DISORDER

What then is the nature of the disease? What are the causes of the European disorder? There are three chief and essential causes—disorganised production; overwhelming public debts; the transference of wealth from one nation to another. The three may be discussed briefly.

First disorganised production. It is obvious to any intelligent observer that the mania for all-round production, which was developing before the War, sheltered behind the customs frontiers, is spreading ruin to-day. During the War nations which were obliged to organise home production of goods formerly obtained from their enemies, were forced into "omniproduction" and now find great difficulty in abandoning it. The result is an incalculable loss of labour and extreme difficulty in co-ordinating the production of the different nations. In a word, abundant waste at a time when every scrap of human labour ought to be utilised to the full.

Simultaneously, the burden of the War is demanding an immense toll from human labour—human labour again. A vast tribute is required to provide the interest on the national debts, debts which are simply a dead weight. The living are toiling for the dead; or, if another figure of speech is preferred, behind the producer as he creates wealth stands an invisible being who diverts part of it and casts it into the abyss—deeper here, shallower there—of the State's debit account.

When the debt is held internally, the evil is only half an evil; but when the money is required for the service of an external debt, the general damage to economic life is immeasurable. Nothing is more complicated in its essence than the transference of wealth from one nation to another. It can only be effected by exporting commodities or rendering services, processes which are extremely difficult on a large scale, even in a time of economic tranquillity. In a time of universal instability, when Europe is split into

pieces which only the most delicate handling can ever bring together again, to attempt to transfer large amounts of wealth from one country to another is simply tempting fate.

#### V. THE REMEDY

Are we then to despair? By no means. There is one remedy—not two, but one—European solidarity.

Let no one be deceived. The causes of the economic disaster, some of which have been indicated, are bound up with a general state of mind, which, in a greater or less degree, is the origin of them all. The nations of Europe have been slow to rid themselves of the hatred which had entwined them during the War, in a fashion unparalleled in the history of the civilised world, yet at last have painfully raised themselves to a higher level. The new mentality, however, is not high enough in view of the vastness of the problems to be solved. The mass of the people believe that the sole result to be aimed at is a return to pre-War conditions. If any honestly believe this let their eyes now be opened. There was, it is true, a time of padded ease and comfort, the memory of which recalls Talleyrand's words: "Those who did not know French society before 1789 will never know how pleasant life can be." Life was also pleasant before 1914; so pleasant that no one troubled to see that its foundations were secure.

Regrets are useless. The past is past. We must look forward. It must be recognised that since all the normal laws of trade, credit and production have been and are being violated, the great effort at reconstruction cannot succeed as long as it is overshadowed by the politics of measured *rapprochement* between the European States which, while rightly advocated by farseeing men before 1914, is not applicable to the new conditions. We must begin afresh, take large views. First of all each country has work to do at home, to balance and more than balance, its budget, and to close the door against loans in any form whatever. Next, there must be a universal return to the gold standard, with the necessary precautions and by suitable stages. But the operation can only succeed if the banks of issue, which control the note circulation in the various countries, work together in such a way as to be able to aid one another at need. This great step accomplished, Europe will once more possess a healthy currency, and a sane and well balanced economic activity will follow. It must inevitably be so.

It is true that these things are being done but they are being done too timidly, and no more than a beginning has been made. Similarly, attempts are being made to solve the problem of the international debts, but they are not adequate. The European nations have not yet grasped the fact that they must reach full agreement if the burden of their mutual debts is to be lightened. They do not realise that in present day conditions, transfers of wealth from one country to another resolve themselves into one vast transfer from the Old World to the New. Ultimately, it all resolves itself into a tribute paid by Europe, the loser of the economic war, to America. It is essential that the debtors should take counsel together so as to distribute the burden in the least irksome way and to obtain from their creditor, the super-victor of the War, the concessions and conditions which both reason and justice demand.

It is no less essential to inaugurate economic co-operation between the nations of Europe. In this respect also some progress has been made. People are beginning to feel the necessity of curbing the rampancies of protectionism. Commercial treaties are being negotiated in almost every direction, but as they are framed on the old lines they are proving quite inadequate. If economic peace is to become a reality there must be general agreements far broader than those of former days, to lay down understandings between producers for the division of the great exporting industries between the various nations, and for the systematic apportionment of raw materials.

#### VI. NEW GUIDANCE

The road to be travelled is long, arduous and strewn with obstacles. One stage, however, was passed when the representatives of the chief European powers in a little Swiss town signed

disinterested political agreements and accepted the principle of arbitration. Needless to say, it is far easier to arrive at understandings in the realm of pure politics than to unite in one economic and financial order when interests clash. Nevertheless we must persevere, or the achievement of Locarno is doomed to be barren. Shall we succeed? Yes, if a European public spirit can develop and, *above all*, if Europe is governed.

The words "above all" are here emphasised because if public opinion influences governments, governments form it and mould it, if knowing how to govern when they govern. European opinion is turning towards the conception of mutual help and understanding. As yet, however, it stammers in its speech. It must learn to speak loud enough to frighten narrow nationalisms back to the tomb where they ought to be rotting, but it can do this only if it is supported—nay, capably driven, whipped on.

In *La Puine de la civilisation antique*, the eminent historian Guglielmo Ferrero says:—

If Europe had governments of adequate strength and recognised authority, the work of reconstruction would be easily and swiftly accomplished with the very powerful means which western civilisation can command. But, ruined by the War, plunged in the depths of misery, at grip with all manner of difficulties, political, economic, military and diplomatic, which were engendered by the War, and with no Governments capable of governing, the greater part of Europe will probably fall into prolonged anarchy.

We should do well to ponder these words. The will towards a new grouping in Europe may be paralysed by the weakness of governments. But why are they so weak? Because in the centre of the old Continent parliamentary government, which has taken the place of the ancient monarchies that went down in blood and mud, is as yet an improvisation. It will only achieve authority, the keystone of every social edifice, as representative government grows stronger in Western Europe, on whose institutions it is necessarily modelled.

Now, it is useless to deny that in Western Europe parliamentary government is being severely tested. This is scarcely matter for surprise. In many countries no steps have been taken to make its position secure. Things have been allowed to drift; the mania for words—that plague of the Latin peoples and some others—has spread so that chatter has become the order of the day, while legislative disorder and ministerial crises teem and multiply. In the "padded" age—the adjective was apt—before 1914 it was always possible—to float with the tide. There was an immense amount of prosperity. People believed that the line of progress was a continuously ascending curve. To-day we have to sing a different tune, to bid good-bye to our illusions, to realise that a vessel which could make excellent progress on an oily sea cannot keep an even keel on the ocean when the great waves are unloosed.

Let us leave metaphor aside. Only a great renewal can keep post-War Europe alive. And the essential condition of the transformation is that there should be governments which are both authoritative and stable, so that they may be able to make bold and rapid decisions and to take the long view which alone makes it possible to subordinate particular interests to the general interest. The European peoples, who are vaguely conscious of these things, are in an uneasy state. Some of them are drifting into dictatorship—a temporary solution, and an extremely dangerous one unless, as in ancient Rome, it is embedded in the framework of the constitution, unless it provides for the full restoration of responsible government at the expiration of a term fixed by the fundamental laws of the State. In other countries there is hesitation or shirking of the issues. The people must understand that the road to salvation is through the renaissance of the parliamentary system, and through a régime which knows discipline, where there will be a limit to pettifoggery, and the chambers will be assisted by the great economic forces, grouped together and taught how to collaborate with the people's representatives.

Before very long the citizens of every nation of the continent will hear these truths and will realise the tragic dilemma which confronts them: "Europe must either organise and unite or perish." "I am in advance perhaps of my time; I am sure I am serving it." (J. CA.)

**WORLD WAR.**—The aim of this article is to trace the main strategic currents of the World War, as also the conditions and ideas which guided them. The causes of the War itself are not within our scope. A process of 50 years had gone to make Europe inflammable, and a few days were enough to detonate it. To study the causes of the conflict on the German side we should have to trace the influence of Prussia on the creation of the Reich, the political conceptions of Bismarck, the German philosophical tendencies, her economic situation—a medley of factors which transmuted Germany's natural desire for commercial outlets, unhappily difficult to obtain, into a vision of world-power. We should have to analyse that heterogeneous relic of the Middle Ages known as Austria-Hungary, appreciate her complex racial problems, the artificiality of her governing institutions, the superficial ambitions which overlay a haunting fear of internal disruption and frantically sought to postpone the inevitable end.

On the other side we should have to examine the strange mixture of ambition and idealism which swayed Russian policy; we should have to understand the constant and justifiable fear of fresh aggression which France had suffered since 1870, and follow the regrowth of confidence which fortified her to resist further threats; finally, we should have to trace Britain's gradual movement from a policy of isolation into membership of the European system and her slow awakening to the reality of German ambitions. Beside these fundamental causes the international "incidents" that took place between 1899 and 1914 are but symptoms.

## I. INTRODUCTION

*The Armed Forces.*—The World War may be briefly epitomised, as a progress from convention through chaos to co-operation. The nations entered upon the conflict with the conventional outlook and system of the 18th century merely modified by the events of the 19th century. Politically, they conceived of it as a struggle between rival coalitions based on the traditional system of diplomatic alliances; and militarily as between professional armies—swollen, it is true, owing to the continental system of conscription, yet essentially fought out by soldiers while the mass of the people watched, from seats in the amphitheatre, the efforts of their champions. The Germans alone had a glimpse of the truth, but—one or two prophetic minds apart—the "Nation in Arms" theory evolved by them during the 19th century visualised the nation rather as a reservoir to pour its reinforcements into the army than as a mighty river in which are merged many tributary forces, of which the army is but one. Their conception was the "Nation in Arms," hardly the "Nation at War." Even to-day this fundamental truth has yet to be grasped in its entirety and its full implications understood. Progressively throughout the years 1914–8 the warring nations enlisted the research of the scientist, the inventive powers and technical skill of the engineer, the manual labour of industry, and, as potent as any, the pen of the propagandist. For long this fusion of many forces tended to a chaotic maelstrom of forces; the old order had broken down, the new had not yet evolved. Only gradually did a working co-operation emerge, and it is a moot point whether even in the last phase co-operation of forces had attained to the higher level of co-ordination—direction by unity or diversity.

The German Army of 1914 was born in the Napoleonic wars, nursed in infancy by Gneisenau and Scharnhorst, and trained in adolescence by the elder Von Moltke and Von Roon. It reached maturity in the war of 1870, where it emerged triumphantly from a test against the long-service army of France. Every physically able citizen was liable to service, and the State took the number it desired, trained them to arms for a short period of full-time service, and then returned them to civil life. The feature, as also the object, of this system was the production of a huge reserve by which to expand the active army in war. A man

<sup>1</sup>For the political and diplomatic history of the struggle see the article EUROPE.

served two or three years full-time, according to his branch of the service, followed by five or four years in the regular reserves. He then went into the Landwehr for 12 years, and finally passed into the Landsturm from 39 till forty-five. Further, an Ersatz reserve was formed of those who were not called on for service with the colours.

In this organisation and the thoroughness of the training lay the secret of the first great surprise of the War, one which almost proved decisive. For instead of regarding their reservists as troops of doubtful quality, fit only for an auxiliary rôle or garrison duty, the Germans during mobilisation were able to duplicate every first line army corps with a reserve corps—and had the courage, justified by events, to use them in the opening clash. This surprise upset the French calculations, as it dislocated their plan.

The Germans have been reproached for many miscalculations; less than justice has been done to the correctness of many of their intuitions. They alone realised what is to-day an axiom—that, given a highly trained cadre of leaders, a military machine can be rapidly manufactured from the levies of the led, like molten liquid poured into a mould. The German mould was a long-service body of officers and n.c.o.s who in their standard of technical knowledge and skill had no equal in the world. But if the machine was manufactured by training, it gained its solidity from another process. The psychological element plays an even greater part in a “national” than in a professional army. *Esprit de corps* is not enough; the stimulus of a great moral impulse to action is necessary, a deep-rooted belief in the policy for which citizens are called on to fight. The leaders of Germany had worked for generations to inspire their people with a patriotic conviction of the grandeur of their country's destiny. And if their opponents went forth to battle in 1914 with as intense a belief in their country's cause, this flaming patriotism had not the time to consolidate such a disciplined combination as years of steady heat had produced in Germany. The German people had an intimacy with and a pride in their army, notwithstanding its severity of discipline, that was unknown elsewhere.

This unique instrument was handled by a general staff which, by rigour of selection and training, was unmatched for professional knowledge and skill, if subject to the mental “grooves” which characterise all professions. Executive skill is the fruit of practice; and constant practice, or repetition, tends inevitably to deaden originality and elasticity of mind. In a professional body, also, promotion by seniority is a rule difficult to avoid. The Germans, it is true, tended towards a system of staff control, which in practice frequently left the real power in the hands of youthful general staff officers. As war memoirs and documents reveal, the chiefs of staff of the various armies and corps often took momentous decisions with hardly a pretence of consulting their commanders. But such a system had grave objections, for such a happy combination as that of a Hindenburg and Ludendorff is rarely found, and from it came the grit in the wheels which not infrequently marred the otherwise well-oiled working of the German war-machine.

Tactically, the Germans began with two important material advantages. They alone had gauged the potentialities of the machine-gun and of the heavy howitzer, and had provided adequate numbers of these weapons. Strategically, also, the Germans had brought the study and development of railway communications to a higher pitch than any of their rivals.

The Austro-Hungarian Army, if patterned on the German model, was a vastly inferior instrument. Not only had it a tradition of defeat rather than of victory, but its racial mixture prevented the moral homogeneity that distinguished its ally. This, being so, the replacement of the old professional army by one based on universal service lowered rather than raised its standard of effectiveness. The troops within the borders of the empire were often racially akin to those beyond, and this compelled her to a politically instead of a militarily based distribution of forces, so that kinsmen should not fight each other. And her human handicap was increased by a geographical one—the vast extent of frontier to be defended. Nor were her leaders,

with rare exceptions, the professional equals of the Germans, and if common action was better than with the Entente Powers, Austria did not accept German direction gladly.

Yet despite all its evident weaknesses this loosely knit conglomerate of races withstood the shock and strain of war for four years, in a way that surprised and dismayed her opponents. The explanation is that this complex racial fabric was woven on a stout Germanic and Magyar framework.

From the Central we turn to the Entente Powers. France possessed but 60% of the potential man-power of Germany, and this debit balance had forced her to call on the services of practically every able-bodied male. A man was called up at 20, did three years' full-time service, then 11 in the reserve and finally two periods of seven years each in the Territorial Army and Territorial Reserve. This system gave France an initial war strength of some 4,000,000 men, equal to her German rival, but, in contrast, she placed little reliance on the fighting values of reservists. The French command counted only on the semi-professional troops of the first line, about 1,500,000 men, for the short and decisive campaign which they expected and prepared for. Moreover, they assumed a similar attitude on the part of their enemy—with dire result. But this initial surprise apart, a more profound handicap was the lesser capacity of France for expansion, in case of a long war, due to her smaller population—under 40,000,000 compared with Germany's 65 millions. Colonel Mangin, later to become famous, had advocated tapping the resources in Africa, the raising of a huge native army, but the Government had considered the dangers to outweigh the advantages of such a policy.

The French general staff, if less technically perfect than that of Germany, had produced some of the ablest military thinkers in Europe, and its level of intelligence could well bear comparison. Unfortunately, in recent years a sharp division of thought had arisen, which did not make for combined action. In *matériel*, the French had one great asset in their quick-firing 75 mm. field gun, the best in the world, but its very value had led them to undue confidence in a war of movement and a consequent neglect of equipment and training for the type of warfare which came to pass.

Russia's assets were in the physical sphere, her defects in the mental or moral. If her initial war strength was no greater than that of Germany, her man-power resources were immense and the courage and endurance of her troops was famous. But corruption and incompetence permeated her leadership, her rank and file lacked the intelligence and initiative for scientific warfare—an instrument of great solidity but little flexibility—and her manufacturing resources for equipment and munitions were far below those of the great industrial Powers. This handicap was made worse by her geographical situation, cut off from her allies by ice- or enemy-bound seas, and with immense land frontiers. Another radical defect was the poverty of her rail communications, the more essential as she relied for success on bringing into play the weight of her numbers. In the moral sphere Russia's condition was less clear. Her internal troubles were notorious and must be a brake on her efforts unless the cause was such as to prove a crusade-like appeal to her primitive and incoherent masses.

Between the military systems of Germany, Austria, France and Russia there was a close relation, differences of detail rather than of fundamental, and this similarity threw into greater contrast the system of the other great European Power—Britain. Throughout modern times she had been essentially a sea-power, intervening on land through a traditional policy of diplomatic and financial support to Allies, whose military efforts she reinforced with a leaven from her own professional army. This regular army was primarily maintained for the protection and control of the overseas dependencies—India in particular—and had always been kept down to the minimum strength for this purpose. The reason for the curious contrast between Britain's determination to maintain a supreme navy and her consistent neglect, indeed starvation of the army, lay partly in her insular position, which caused her to regard the sea as her

essential life-line and main defence, and partly in a constitutional distrust of the army, an illogical prejudice, which had its almost forgotten source in the military government of Cromwell. Small as to size, it enjoyed a practical and varied experience of war without parallel among the continental armies. Compared with them, its professional handicap was that the leaders, however skilled in handling small columns in colonial expeditions, had never directed large formations in *la grande guerre*.

Further, the foundations of a general staff had only been laid since the bitter lessons of the South African War, and the interval was too short, the distractions too great, for this to have been developed to the level of Germany and France. For the progress in organisation in the years before 1914, the British Army owed much to Lord Haldane, and to him also was due the creation of a second line of part-trained citizens—the Territorial Force. Lord Roberts had pleaded for compulsory military training, but the voluntary principle was too deeply embedded in the national mind for this course to be adopted, and Haldane wisely sought to develop Britain's military effectiveness within the bounds set by traditional policy. As a result, 1914 found England with an expeditionary force of some 160,000 men, the most highly trained striking force of any country—a rapier among scythes, and to maintain this at strength the old militia had been turned into a special reserve for drafting. Behind this first line stood the Territorial Force, which if only enlisted for home defence had a permanent fighting organisation unlike the amorphous volunteer force which it superseded. The British Army had no special outstanding asset in war armament, but it had developed a standard of rifle-shooting unique among the world's armies.

The reforms by which the army was brought into line with continental models had one defect, which was accentuated by the close relations established between the British and French general staffs since the Entente. It induced a "continental" habit of thought among the general staff, and predisposed them to the rôle, for which their slender strength was unsuited, of fighting alongside an Allied army. This obscured the British Army's traditional employment in amphibious operations through which the mobility given by command of the sea was exploited. A small but highly trained force striking "out of the blue" at a vital spot could produce a strategical effect out of all proportion to its slight numbers.

The last argument brings us to a comparison of the naval situation, which turned on the balance between the fleets of Britain and Germany. Britain's sea supremacy, for long unquestioned, had in recent years been challenged by a Germany which had deduced that a powerful fleet was the key to that colonial empire which she desired as an outlet for her commerce and increasing population. To the spur of naval competition the British people eventually responded, determined at any cost to maintain their "two-power" standard. If this reaction was instinctive rather than reasoned, its subconscious wisdom had a better foundation than the catchwords with which it was justified, or even than the need of defence against invasion. The industrial development of the British Isles had left them dependent on overseas supplies for food, and on the secure flow of seaborne imports and exports for industrial existence. For the navy itself this competition was a refining agency, leading to a concentration on essentials. Gunnery was developed and less value attached to polished brasswork; warship design and armament were transformed—the "Dreadnought" ushering in a new era, of the all big-gun battleship. By 1914 Britain had 29 such capital ships and 13 building, to the 18 built and nine building, of Germany. Further, Britain's naval strength had been soundly distributed, the main concentration being in the North Sea.

More open to criticism, in view of the forecasts of several naval authorities, was her comparative neglect of the potential menace of the submarine. Here German opinion was shown rather by the number building than those already in commission. It is to Germany's credit that though lacking a sea tradition, her fleet an artificial rather than a natural product, the technical skill of the German Navy made it a formidable rival to the British ship for ship, and perhaps its superior in scientific gunnery.

But in the first stage of the struggle the balance of the naval forces would affect the issue far less than the balance on land. For a fleet suffers one inherent limitation—it is tied to the sea, and hence cannot strike direct at the hostile nation. The fundamental purpose of a navy is therefore to protect a nation's sea communications and sever those of the enemy, and, although victory in battle may be a necessary prelude, blockade is the ultimate purpose. And as blockade is a weapon slow to take effect, its influence could only be decisive if the armies failed to secure the speedy decision on land, upon which all counted.

*The Economic Forces.*—In this idea of a short war lay also the reason for the comparative disregard of economic forces. Few believed that a modern nation could endure for many months the strain of a large-scale conflict. The supply of food, of munitions and their manufacture, of funds, were problems only studied on brief estimates. Of belligerents, all could feed themselves save Britain and Germany, and Germany's deficit of home-grown supplies could only be serious in the event of a struggle of years. But Britain would starve in three months if her outside supplies were cut off.

In munitions and other war material Britain's industrial power was greatest of all, though conversion to war production was a necessary preliminary, and all, again, depended on the security of her sea communications. France was weak, and Russia weaker still, but the former unlike the latter could count on outside supplies so long as Britain held the seas. As Britain was the industrial pivot of the one alliance, so was Germany of the other. A great manufacturing nation, she had also a wealth of raw material, especially since the annexation of the Lorraine iron-fields after the 1870 war. But the stoppage of outside supplies must be a handicap in a long war, increasing with its duration, and serious from the outset in such tropical products as rubber. Moreover, Germany's main coal and iron fields lay dangerously close to her frontier, in Silesia on the east and in Westphalia and Lorraine on the west. Thus for the Central Alliance a quick decision and an offensive war were more vital than for the Entente.

Similarly, the financial resources were calculated on a short war basis, and all the continental Powers relied mainly on large gold reserves accumulated specially for war purposes. Britain alone had no such war chest, but she was to prove that the strength of her banking system and the wealth distributed among a great commercial people furnished the "sinews of war" in a way that few pre-War economists had realised.

*The Psychological Forces.*—If the economic forces were neglected in the war calculations of the Powers, the psychological forces were an unexplored region, except in their purely military aspect. And even here little study had been devoted to the moral element compared with the physical element. Ardant du Picq, a soldier-philosopher who fell in the 1870 war, had stripped battle of its aura of heroic fictions, portraying the reaction of normal men in the presence of danger. Several German critics had described from experience the reality of battle-morale as shown in 1870, and had deduced how tactics should be based on the ever-present and balancing elements of fear and courage. At the close of the century a French military thinker, Colonel Foch, had demonstrated how great was the influence of the moral element in the higher sphere of command. But only the fringe of the subject had been penetrated. Its civil aspects were untouched, and in the opening weeks of the conflict the general misunderstanding of national psychology was to be shown in the undue muzzling of the Press, followed by the equally stupid practice of issuing communiqués which so veiled the truth that public opinion became distrustful of all official news and rumour was loosed on its infinitely more damaging course. The true value of wisely calculated publicity and the true application of the propaganda weapon was only to be learnt after many blunders.

*The Rival Plans.*—In this survey the German plan justly takes priority, for not only was it the mainspring which set in motion the hands of the war clock in 1914, but it may even be said to have governed the course of the War thereafter. It is

true that outwardly this course from the autumn of 1914 onwards seemed to be of the nature of a stupendous "siege" of the Central Powers, an idea which is incompatible with the terms we have used. But the conception of the Germanic alliance as a besieged party, although true of the economic sphere, suggests a passivity which their strategy contradicts. Although the initial German plan miscarried, even in its failure it dictated the general trend of operations thereafter. Tactically, most of the fighting resembled siege operations, but the actual strategy on land for long erred rather by its disregard of these tactical conditions than by its conformity with them.

The Germans were faced with the problem that the combined forces of themselves and Austria were decidedly inferior to those of France and Russia. To offset this adverse balance, however, they had a central position and the anticipation that Russia's mobilisation would be too slow to allow her to exert serious pressure in the opening weeks. While this assumption might suggest a decisive blow at Russia before she was ready, it was equally probable that she would concentrate her main forces too far back for such a German blow to reach—and the experience of Napoleon was not an example to encourage an advance deep into the interior of Russia, with its vast distances and poor communications. The plan adopted by Germany was, therefore, a rapid offensive against France while holding the Russian advanced forces at bay, and later, when France was crushed, to deal with the Russian Army. But this plan, in turn, was complicated by the great natural and artificial barriers which the French frontier offered to an invader. It was narrow, only some 150 m. across, and so afforded little room for manoeuvre or even to deploy the masses that Germany planned to launch against her foe. At the southeastern end it abutted on Switzerland, and after a short stretch of flat country known as the Gap of Belfort the frontier ran for 70 m. along the Vosges Mountains. Thence the line was prolonged by an almost continuous fortress system, based on Epinal, Toul, Verdun and just beyond the last-named lay not only the frontiers of Luxembourg and Belgium but the difficult Ardennes country. Apart from the strongly defended avenues of advance by Belfort and Verdun, the only feasible gap in this barrier was the Trouée de Charmes between Epinal and Toul, left open originally as a trap in which the Germans could be crushed by a French counter-stroke.

Faced with such a mental and physical blank wall, the logical military course was to go round it—by a wide manoeuvre through Belgium. Graf von Schlieffen, chief of the German general staff from 1891 to 1906 conceived and developed from 1895 onwards the plan, by which the French armies were to be enveloped and a rapid decision gained, and as finally formulated it came into force in 1905. To attain its object von Schlieffen's plan concentrated the mass of the German forces on the right wing for this gigantic wheel and designedly took risks by reducing the left wing, facing the French frontier, to the slenderest possible size. The swinging mass of five armies, pivoting on the fortified area Metz-Thionville, was to consist of 53 divisions, backed up as rapidly as possible by Landwehr and Ersatz formations, while the two armies of the left wing comprised only nine divisions. Their very weakness promised to aid the main blow in a further way, for if a French offensive pressed them back towards the Rhine, the attack through Belgium on the French flank would be all the more difficult to parry. It would be like a revolving-door—if a man pressed heavily on one side the other side would swing round and strike him in the back. The German enveloping mass was to sweep round through Belgium and northern France and, continuing to traverse a vast arc, would wheel gradually east. With its extreme right passing south of Paris and crossing the Seine near Rouen it would then press the French back towards the Moselle, where they would be hammered in rear on the anvil formed by the Lorraine fortresses and the Swiss frontier.

Schlieffen's plan allowed 10 divisions to hold the Russians in check while the French were being crushed. It is a testimony to the vision of this remarkable man that he counted on the intervention of Britain, and allowed for an expeditionary force of

100,000 "operating in conjunction with the French."<sup>1</sup> To him also was due the scheme for using the Landwehr and Ersatz troops in active operations and fusing the resources of the nation into the army. His dying words were, "It must come to a fight. Only make the right wing strong."

Unhappily for Germany, if happily for the world, the younger Von Moltke, who succeeded him, lacked his moral courage and clear grasp of the principle of concentration. Moltke retained Schlieffen's plan, but he whittled away the essential idea. Of the nine new divisions which became available between 1905 and 1914 Moltke allotted eight to the left wing and only one to the right. True, he added another from the Russian front, but this trivial increase was purchased at a heavy price, for the Russian Army of 1914 was a far more formidable menace than when Schlieffen's plan came into force. The result was to be that two army corps were taken from the French theatre at the crisis of the Aug. campaign, in order to reinforce the Eastern front. Schlieffen's death-bed warning was lost on his successor.

If the fault of the final German plan was a lack of courage, that of the French plan was due to an excess. In their case, also, a miasma of confused thought seemed to creep over the leadership in the years just before the War. Since the disasters of 1870 the French command had planned an initial defensive, based on the frontier fortresses, followed by a decisive counter-stroke. To this end the great fortress system had been created, and gaps like the Trouée de Charmes left to "canalise" the invasion ready for the counter. But in the decade before 1914 a new school of thought had arisen, who argued that the offensive was more in tune with French character and tradition, that the possession of the "75"—unique in mobility and rapidity of fire—made it tactically possible, and that the alliance with Russia and Britain made it strategically possible. Forgetful of the lessons of 1870 they imagined that *élan* was proof against bullets. Napoleon's much-quoted saying that "the moral is to the physical as three to one" has much to answer for; it has led soldiers to think that a division exists between the two, whereas each is dependent on the other. Weapons without courage are ineffective, but so also are the bravest troops without efficient weapons to protect them and their morale. Courage soon oozes when soldiers lose confidence in their weapons.

The outcome was disastrous. The new school found in General Joffre, appointed Chief of the General Staff in 1912, a lever for their designs. Under the cloak of his authority, the advocates of the *offensive à outrance* gained control of the French military machine, and, throwing aside the old doctrine, formulated the now famous, or notorious, Plan XVII. It was based on a double miscalculation. The initial strength of the German Army in the West was estimated at not more than 40-42 infantry divisions, and although the possibility of a German move through Belgium was recognised, the wideness of its sweep was utterly misjudged. The Germans were expected complaisantly to take the difficult route through the Ardennes in order that the French might conveniently smite their communications! Based on the idea of an immediate and general offensive, the plan ordained a main thrust by the I. and II. Armies towards the Saar into Lorraine. On their left were the III. Army opposite Metz and the V. Army facing the Ardennes, which were either to take up the offensive between Metz and Thionville, or, if the Germans came through Luxembourg and Belgium, to strike northeast at their flank. The IV. Army was held in strategic reserve near the centre and two groups of reserve divisions disposed in rear of either flank—relegation to such a passive rôle expressing French opinion on the capacity of reserve formations.

Britain's share in this plan was settled less by calculation than by the "Europeanisation" of her military organisation during the previous decade. This continental influence drew her insensibly into a tacit acceptance of the rôle of acting as an appendix to the French left wing, and away from her historic exploitation of the mobility given by sea-power. At the council of war on the

<sup>1</sup>H. von Kuhl, "Der Deutsche Generalstab," *Vorbereitung und Durchführung des Weltkrieges* (1920); W. Foerster, *Graf Schlieffen und der Weltkrieg* (1921).

outbreak, Lord Roberts, summoned from retirement, advocated the dispatch of the expeditionary force to Belgium—where it would have stiffened the Belgian resistance and threatened the flank of the wheeling German mass. But his was a voice crying in the wilderness, and in any case the British general staff had virtually pledged themselves to act in direct co-operation with the French. When the general staffs of the two countries conducted their informal negotiations between 1905 and 1914 they little realised that they were paving the way for a reversal of England's centuries-old policy for a war effort such as no Englishman had ever conceived.

On the eastern front, the plans of campaign were more fluid, less elaborately worked out and formulated—although they were to be as kaleidoscopic in their changes of fortune as in the western theatre. The calculable condition was geographical; the main incalculable, Russia's rate of concentration. Russian Poland was a vast tongue of country projecting from Russia proper, and flanked on three sides by German or Austrian territory. On its northern flank lay East Prussia with the Baltic Sea beyond. On its southern flank lay the Austrian province of Galicia with the Carpathian mountains beyond, guarding the approaches to the plain of Hungary. On the west lay Silesia. As the Germanic border provinces were provided with a network of strategic railways whilst Poland, as well as Russia itself, had only a sparse system of communications, the Germanic alliance had a vital advantage, in power of concentration, for countering a Russian advance. But if they took the offensive, the further they progressed into Poland or Russia proper the more would they lose this advantage. Hence their most profitable strategy was, to lure the Russians on into position for a counter-stroke rather than to inaugurate an offensive themselves. The one drawback was that such a Fabian strategy gave the Russians time to concentrate and set in motion their cumbrous and rusty machine.

From this arose an initial cleavage between German and Austrian opinion. The Germans, intent on a decision against France, wished to leave a minimum force in the east, and only a political dislike of exposing national territory to invasion prevented them evacuating East Prussia and standing on the Vistula line. But the Austrians, under the influence of Conrad von Hötzendorf, Chief of their General Staff, were anxious to throw the Russian machine out of gear by an immediate offensive, and as this promised to keep the Russians fully occupied while the campaign in France was being decided Moltke fell in with this strategy.

On the opposing side, also, the desires of one ally vitally affected the strategy of the other. The Russian command, both for military and for racial motives, wished to concentrate first against Austria, while the latter was unsupported, and leave Germany alone until later, when the full strength of the Russian Army would be mobilised. But the French, anxious to relieve the German pressure against themselves, urged the Russians to deliver a simultaneous attack against Germany, and got the Russians to consent to an extra offensive for which they were neither ready, in numbers, nor organised. Russia, whose proverbial slowness and crude organisation dictated a cautious strategy, was about to break with tradition and launch out on a gamble that only an army of high mobility and organisation could have hoped to bring off.

## II. EARLY OPERATIONS

*The Detonation.*—On June 28 1914 the murder of the Austrian Archduke Francis Ferdinand at Sarajevo set light to a powder trail which within a brief span exploded the European magazine in a series of detonations. Exactly one month later Austria-Hungary declared war against Serbia, whose appeal to her ally and protector led Russia to order a partial mobilisation on her southern front. The same day, July 29, an Imperial council at Potsdam decided on war against Russia, and, as a corollary, against France, although hoping to bargain for Britain's neutrality. While the chancelleries of Europe argued at cross-purposes, the military tide swept them off their feet. On July 31 Russia

ordered a general mobilisation and Germany, taking equivalent steps, sent a twelve hours ultimatum. Austria, seeking to temporise, was dragged in the train of her more determined ally. By noon on Aug. 1 a state of war existed between Russia and Germany, and next day German troops entered French territory. At 7 P.M. came Germany's ultimatum to Belgium, demanding an unopposed passage. On Aug. 3 Germany's formal declaration of war on France followed, and on Aug. 4 her troops crossed the Belgian frontier, for the sanctity of which England stood guarantor. At midnight, in reply, England also entered the War—while the Belgian populace, rising to resist the German invaders, sounded the death-knell of gladiatorial wars and inaugurated the new warfare of peoples. And coincidentally, by Italy's declaration of her neutrality, her refusal to fulfil the alliance with her hereditary enemy—Austria—the artificiality of the political alliance system broke down before the new wave of national feeling which was to characterise the World War.

*The Clash in the West.*—The German advance into France was designed as a methodical sweep, so that unexpected checks should not upset its time-table. Confronted with the fact that the Belgians would resist, a detachment was formed under General von Emmich to clear a passage through the Belgian plain north of the Ardennes, ready for the ordered advance of the main armies concentrating behind the German frontier. The ring fortress of Liège commanded this channel of advance, but, after an initial check, a German brigade penetrated between the forts and occupied the town. The interest of this feat is that it was due to the initiative of an attached staff officer, Ludendorff, whose name ere long was to be world-famous. The forts themselves offered a stubborn resistance and forced the Germans to await the arrival of their heavy howitzers, whose destructive power was to be the first tactical surprise of the World War.

The very success of the Belgians' early resistance cloaked the weight of the main German columns and misled the Allies' intelligence. The Belgian field army lay behind the Gette covering Brussels, and even before the Liège forts fell the advanced guards of the German I. and II. Armies were pressing against this line. The Belgians, deprived of support owing to the mistaken French plan and British conformity with it, decided to save their army by falling back on the entrenched camp of Antwerp. The Germans, their passage now clear, entered Brussels on Aug. 20, and on the same day appeared before Namur, the last fortress barring the Meuse route into France. It deserves emphasis that despite the Belgian resistance the German advance was slightly ahead of its time-table.

Meanwhile, away on the other flank, the main French thrust into Lorraine had begun on Aug. 14 and been shattered in the battle of Morhange-Saarburg, Aug. 20, where the French discovered that the material could subdue the moral, and that in their enthusiasm for the offensive they had blinded themselves to the defensive power of modern weapons, a condition which was to throw out of balance the whole mechanism of orthodox warfare. Yet it is but fair to add that this abortive offensive had an indirect effect, although this would hardly have been so if a Schlieffen or a Ludendorff had been in charge at German headquarters instead of the vacillating Moltke. Despite the fact that Moltke had almost doubled the strength of his left, compared with Schlieffen's plan, he had so little moral decision that when the French attack in Lorraine developed he diverted thither many of the newly formed divisions that should have been used to increase the weight of his right wing. When, however, the French were repulsed, he swung to the other extreme and acceded to the pleas of the importunate Crown Prince Rupprecht of Bavaria, who disliked a defensive rôle when others were reaping the personal glory of advance. Similarly, the German Crown Prince, commanding the pivotal V. Army between Metz and Thionville, attacked when he had been ordered to stand on the defensive. The lack of what Colonel Foch had termed "intellectual discipline" was to be a grave factor in Germany's failure, and for this the ambitions of "court" generals were to be largely responsible. Following up the French retreat from Lorraine, Rupprecht's Army entangled itself in a hopeless attempt

to force the French fortified zone between Nancy and the Vosges. Here the Germans in turn learnt the new power of modern defence, and did not even prevent the French drawing off troops to reinforce the other flanks.

But while this "see-saw" campaign in Lorraine was taking place, more decisive events were occurring to the northwest. The attack on Liège awakened Joffre to the reality of a German advance through Belgium, but not to the wideness of the sweep. And the sturdy resistance of Liège confirmed him in the opinion that the German right would pass south of it, through the Ardennes. Plan XVII. had visualised such a move, and prepared a counter. Grasping once more at phantoms, the French command embraced this idea so fervently that they transformed the counter into an imaginary *coup de grâce*. Their III. Army and the reserve IV. Army were to strike northeast through the Ardennes against the rear flank of the Germans advancing through Belgium. The left wing (V.) Army, under Lanrezac, was moved further to the northwest into the angle formed by the Sambre and Meuse between Givet and Charleroi. With the British expeditionary force coming up on its left, it was to deal with the enemy's forces north of the Meuse and to converge on the supposed German main forces in conjunction with the attack through the Ardennes. Here was a pretty picture—of the Allied pincers closing on the unconscious Germans! Curiously, the Germans had the same idea of a pincer-like manoeuvre, with rôles reversed, and with better reason.

The fundamental flaw in the French plan was that the Germans had deployed half as many troops again as they had been credited with, and for a vaster enveloping movement. The French, pushing blindly into the Ardennes against a German centre, supposedly denuded of troops, blundered against the German III. and IV. Armies, and were heavily thrown back in encounter-battles around Virton-Neufchâteau. Fortunately the Germans were also too vague as to the situation to exploit their opportunity.

But to the northwest the French V. Army and the British had, under Joffre's orders, put their head almost into the German noose. The German masses of the I. and II. Armies were closing on them from the north, and the III. Army from the east. Lanrezac alone had an inkling of the hidden menace. All along he had suspected the wideness of the German manoeuvre, and it was through his insistence that his army had been permitted to move so far north. It was due to his caution in hesitating to advance across the Sambre, to the arrival of the British on his left unknown to the German intelligence, and to the premature attack of the German II. Army, that the Allied forces fell back in time and escaped from the trap.

At last Joffre realised the truth and the utter collapse of Plan XVII. Resolution was his greatest asset, and with imperturbable coolness he formed a new plan out of the wreckage. He decided to swing back his centre and left, with Verdun at the pivot, while forming a fresh VI. Army to enable the retiring armies to return to the offensive. His optimism might have been again misplaced but for German mistakes. The first was Moltke's folly in detaching seven divisions to invest Maubeuge and Givet and watch Antwerp, instead of using Landwehr and Ersatz troops as Schlieffen had intended. More ominous still was his decision on Aug. 25 to send four divisions to check the Russian advance in East Prussia. All these were taken from the right wing, and the excuse afterwards given for this violation of the principle of concentration was that the German headquarters thought that the decisive victory had already been won! Further, German headquarters lost all touch with the advancing armies and the movements of these became disjointed. The British stand at Le Cateau and Lanrezac's *riposte* at Guise were also factors in checking the German enveloping wing, and each had still greater indirect effects. For Le Cateau apparently convinced the German I. Army commander, Von Kluck, that the British Army could be wiped from the slate, and Guise led Von Bulow (II. Army) to call on the I. Army for help, whereupon Von Kluck wheeled inwards, thinking to roll up the French left. The idea of a Sedan was an obsession with

the Germans, and led them to pluck the fruit before it was ripe. This premature wheel before Paris had been reached was an abandonment of the Schlieffen plan, and exposed the German right to a counter-envelopment. One further factor must be mentioned, perhaps the most significant of all: the Germans had advanced so rapidly, out-running their time-table, that their supplies failed to keep pace. Thus, in sum, so much grit had worked into the German machine that a slight jar would suffice to cause its breakdown. This was delivered in the battle of the Marne.

The opportunity was perceived, not by Joffre, who had ordered a continuance of the retreat, but by Gallieni, the Governor of Paris, where the new VI. Army was assembled. On Sept. 3 Gallieni realised the meaning of Von Kluck's wheel inwards, directed Maunoury's VI. Army to be ready to strike at the exposed German right flank, and with some difficulty won Joffre's sanction. Once convinced, Joffre acted with decision. The whole retiring line was ordered to turn about and return to a general offensive from Verdun westwards. The Germans, their advance finally dislocated by this jar, fell back in retreat, and Moltke gave place to Falkenhayn. It was a strategic but not a tactical defeat, and the German forces were able to stand firmly on the line of the Aisne. Here was re-emphasised the preponderant power of defence over attack, primitive as were the trench lines compared with those of later years. Then followed, as the only alternative, the successive attempts of either side to envelop the other's western flank, a phase known as the "race to the sea." This common design brought out what was to be a new and dominating strategical feature—the lateral switching of reserves by railway from one part of the front to another. Before it could reach its logical and lateral conclusion, a new factor intervened. Antwerp, with the Belgian field army, was still a thorn in the German side, and Falkenhayn determined to reduce it while a German cavalry force swept across to the Belgian coast as an extension of the enveloping wing in France.

The menace to Britain, if the Channel ports fell into German hands, was obvious. It is a strange reflection that the British command should have neglected to guard against the danger hitherto, although the First Lord of the Admiralty, Mr. Winston Churchill, had urged the necessity even before the battle of the Marne. When the German guns began the bombardment of Antwerp on Sept. 28 England awakened, and gave belated recognition to Churchill's strategic insight. He was allowed to send a brigade of marines and two newly formed brigades of naval volunteers to reinforce the defenders, while a regular division and cavalry division, under Rawlinson, were landed at Ostend and Zeebrugge for an overland move to raise the siege. Eleven Territorial divisions were available in England, but, in contrast to the German attitude, Kitchener considered them still unfitted for an active rôle. The meagre reinforcement delayed, but could not prevent, the capitulation of Antwerp, Oct. 10, and Rawlinson's relieving force was too late to do more than cover the escape of the Belgian field army down the Flanders coast.

Yet viewed in the perspective of victory, this first and last effort in the west to make use of Britain's amphibious power applied a brake to the German advance down the coast which just stopped their second attempt to gain a decision in the west. It gained time for the arrival of the main British force, transferred from the Aisne to the new left of the Allied line, and if their heroic defence at Ypres, aided by the French and Belgians along the Yser to the sea, was the human barrier to the Germans, it succeeded by so narrow a margin that the Antwerp expedition must be adjudged the saving factor. This defence of Ypres is in a duel sense the supreme memorial to the British Regular Army, for here they showed the inestimable value of the disciplined moral and unique standard of musketry which were the fruit of long training, and here was their tombstone. "From failing hands they threw the torch" to the new national armies rising in England to the call of patriotism. With the continental Powers the merging of conventional armies into national armies was a hardly perceptible process because of their system of

universal service. But with Britain it was clearly stamped as revolution, not evolution. While the little professional army sacrificed itself as the advanced guard of the nation, the truth of the new warfare of peoples was beginning to come home to the civilian population. Lord Kitchener, a national symbol because of his imperial achievements, had been summoned to the post of War Minister, and with a supreme flash of vision had grasped, in contrast to governments and general staffs alike, the probable duration of the struggle. The people of Britain responded to his call to arms, and like an ever-rising flood the "New Armies" came into being. By the end of the year nearly 1,000,000 men had enlisted and the British Empire had altogether some 2,000,000 under arms. Perhaps Kitchener was wrong in not basing this expansion, from a professional to a national scale, on the existing Territorial foundation. It must be remembered, however, that the Territorial Force was enlisted for home defence and that initially its members' acceptance of a wider rôle was voluntary. Perhaps, also, he was tardy in recognising their military value.

The duplication of forces and of organisation was undoubtedly a source of delay and waste of effort. Kitchener has also been reproached with his reluctance to replace the voluntary system by conscription, but this criticism overlooks how deeply rooted was the voluntary system in British institutions, and the slowness with which lasting changes can be effected in them. If Kitchener's method was characteristic of the man, it was characteristic of England. If it was unmethodical, it was calculated to impress most vividly on the British people the gulf between their "gladiatorial" wars of the past and the national war to which they were committed.

While a psychological landmark, the battle of Ypres is also a military landmark. For with the repulse of the German attempt to find an open flank the trench barrier was consolidated from the Swiss frontier to the sea. The power of modern defence had triumphed over attack, and stalemate ensued. The military history of the Entente during the next four years is a story of the attempts to upset this deadlock, either by forcing the barrier or by finding a way round.

*The See-saw in the East.*—But on the eastern front the greater distances and the greater differences between the equipment of the armies ensured a fluidity which was lacking in the west. Trench lines might form, but they were no more than a hard crust covering a liquid expanse. To break the crust was not difficult, and once broken, mobile operations of the old style became possible. This freedom of action was denied to the Western Powers, but Germany, because of her central position, had an alternative choice, and from Nov. 1914 onwards her command adopted a defensive in France while seeking to cripple the power of Russia in the east. Here, the opening encounters had been marked by rapid changes of fortune rather than by any decisive advantage. The Austrian command, emulating their allies, contrary to the principle of concentration detached part of their strength in an abortive attempt to crush Serbia. And their plan for an initial offensive to cut off the Polish "tongue" was further crippled by the fact that the German part of the pincers did not operate. It was indeed being menaced by a Russian pair of pincers instead, for the Russian commander-in-chief, the Grand Duke Nicholas, had ordered his I. and II. armies to invade East Prussia instantly, in order to ease the pressure on his French allies. As the Russians had more than a two-to-one superiority, a combined attack had every chance of crushing the Germans between the two armies. On Aug. 17, *Rennenkampf's* I. Army crossed the East Prussian frontier, and on Aug. 19-20 defeated *Prittwitz's* VIII. Army at Gumbinnen. On Aug. 21 *Prittwitz* heard that the Russian II. Army under *Samsonov* had crossed the southern frontier of East Prussia in his rear. In panic *Prittwitz* momentarily spoke of falling back behind the Vistula, whereupon *Moltke* superseded him by a retired general, *Hindenburg*, to whom was appointed as chief of staff *Ludendorff*, the hero of the Liège attack.

Developing a plan already initiated by Colonel Hoffman of the VIII. Army staff, *Ludendorff* concentrated some six divisions

against *Samsonov's* left wing. This force, inferior in strength to the Russians, could not have been decisive, but *Ludendorff*, finding that *Rennenkampf* was still near Gumbinnen, took the calculated risk of withdrawing the German troops from that front and rushing them back against *Samsonov's* right wing. This daring move was aided by the absence of communication between the two Russian commanders and the German's ability to decipher *Samsonov's* wireless orders to his corps. Under the converging blows *Samsonov's* flanks were crushed and his centre surrounded. The outcome of this military masterpiece afterwards christened the battle of Tannenberg, was the destruction of almost the whole Russian II. Army. Then receiving two fresh army corps from the French front, the German commander turned on the dilatory *Rennenkampf* and drove him out of East Prussia.

Away on the southern front, however, the scales had tilted against the Central Powers. The offensive of the Austrian I. and IV. armies into Poland was nipped in the bud by a Russian onslaught on the II. and III. armies which were guarding their right flank. These armies were heavily defeated round *Lemberg*, and before long the whole Austrian line was in retreat, falling back almost to Cracow by the end of September. Austria's plight compelled the Germans to send aid, and the bulk of the force in East Prussia was formed into a new IX. Army and switched south to the southwest corner of Poland, whence it advanced on Warsaw in combination with a renewed Austrian offensive. But the Russians were now approaching the full tide of their mobilised strength; counter-attacking, they drove back the advance and followed it up by a powerful effort to invade Silesia.

The Grand Duke Nicholas formed a huge phalanx of seven armies—three in the van and two protecting either flank. Allied hopes rose high as the much-heralded Russian "steam-roller" began its ponderous advance. To counter it the German eastern front was placed under *Hindenburg* and *Ludendorff*, who devised yet another master-stroke, based on the system of lateral railways inside the German frontier. While the Russian advance was slowed down by the thorough destruction of the scanty communications in Poland, *Ludendorff* switched the German IX. Army back from southwest Poland and thrust it, on Nov. 11, down the Vistula against the joint between the two armies guarding the Russian right flank. The wedge, driven in by *Ludendorff's* mallet, sundered the two armies, forced the I. back on Warsaw and almost effected another Tannenberg against the II., which was nearly surrounded at *Lódz*, when the V. Army from the van turned back to its rescue. As a result, part of the German enveloping force almost suffered the fate planned for the Russians, but managed to cut its way through to the main body. If *Ludendorff* was balked of decisive tactical success, this manoeuvre had been a classic example of how a relatively small force, by using its mobility to strike at a vital point, can paralyse the advance of an enemy several times its strength. The Russian "steam-roller" was thrown out of gear, and never again did it threaten German soil.

Within a week, four new German army corps arrived from the western front, and although too late to clinch the missed chance of a decisive victory, *Ludendorff* was able to use them in pressing the Russians back by Dec. 15 to the Bzura-Ravka river line in front of Warsaw. This set-back and the drying up of his munition supplies decided the Grand Duke Nicholas to break off the see-saw fighting near Cracow and fall back on winter trench lines along the Nida and Dunajec rivers, leaving the end of the Polish "tongue" in the hands of the enemy. Thus, on the east as on the west, the trench stalemate had settled in, but the crust was less firm and the Russians had drained their stock of munitions to an extent that their poorly industrialised country could not make good.

*The Grip on the Seas.*—We deal third with the operations at sea, which actually occurred first in chronological order. The reason is that sea-power only came to exert a dominant, perhaps the dominant, influence on the War after the initial plans on land had miscarried. If the quick decision expected by the

military leaders had been reached it is questionable whether sea-power could have affected the issue. How narrowly Germany missed decisive victory, and by what a combination of hardly conceivable blunders, is in the light of history now clear. While it is possible that Britain could, and would have carried on the War unaided, we need to remember that in Aug. 1914 the condition was still that of a professional war with popular backing rather than a truly national war; that British intervention was still regarded as a chivalrous effort to succour violated Belgium and challenged France than as a life and death struggle for Britain's existence. And when a friend lies prone in a tiger's claws it is mistaken friendship to engage in a tug of war for the fragments if there is any chance of enticing the tiger from his prey.

But, fortunately, in 1914, the tiger was held at bay, and with this breathing space gained, Britain had the opportunity to exert her traditional weapon—sea-power. Its effect on the War was akin not to a lightning flash, striking down an opponent suddenly, but to a steady radiation of heat, invigorating to those it was used in aid of, and drying up the resources of the enemy.

But if its effect was extended and cumulative, its application was instantaneous, comparable almost to turning on an electric switch. This simple act, yet perhaps the most decisive of the war, took place before the actual outbreak—on July 29 when at seven o'clock in the morning that greater Armada, the British Grand Fleet sailed from Portland for its war station at Scapa Flow. Few eyes saw its passage, fewer minds knew its destination in those northerly Orkney isles controlling the passage between North Britain and Norway, but from that moment Germany's arteries were subjected to an invisible pressure which never relaxed until on Nov. 21 1918 the German fleet arrived in those same northern waters to hand itself into the custody of a force of whom it had seen no more than a few fleeting glimpses during 4½ years of intangible struggle.

The fundamental cause of this unprecedented type of conflict lay in the recent development of new weapons, the mine and the submarine, which reproduced in naval warfare that same predominance of defensive over offensive power which was the key factor on land. The immediate cause, however, was the strategy adopted by Germany's naval command, partly through a miscalculation of Britain's probable strategy. Appreciating their own inferiority to the British fleet as well as the impossibility of a surprise blow in face of its preparedness, and believing that their enemy was obsessed with the Nelsonian tradition of seeking battle, the German command adopted a Fabian strategy. They aimed to refuse conflict until their mine-layers and submarines had weakened the strength of the British Navy, until the strain of a close blockade began to tell on the superior fleet and perhaps provided the chance of a surprise stroke, and until the conquest of Britain's allies on land made her position more difficult.

The plan had at least a sound geographical basis, for the nature and configuration of the German coast lent itself to this strategy. The short North Sea coastline was heavily indented, the estuaries a maze of difficult channels, and screened by a fringe of islands—of which Heligoland formed a strongly fortified shield to the naval bases at Wilhelmshaven, Bremerhaven and Cuxhaven. Best of all, from the estuary of the Elbe there was a backdoor into the Baltic Sea, the Kiel Canal. By this the naval forces in the Baltic could be rapidly reinforced, while an enemy advance into that land-locked sea was not only hampered by the neutral possession of its approaches but could be imperilled by submarine and destroyer attack while passing through the narrow channels between the Danish Islands. The natural defensive power of Germany's sea-frontiers made attack almost impossible, and conversely gave her an ideal base for raiding operations. The one obvious defect of this Fabian strategy was that it involved the immediate abandonment of Germany's foreign trade and reduced the possibility of her interference with the sea-borne supplies of Britain and her allies.

Moreover, the German plan of progressive attrition was vitiated by the strategy adopted by the British Admiralty,

which abandoned the direct doctrine of seeking out the enemy for the indirect doctrine of "the fleet in being." Realising how the mine and submarine, combined with Germany's natural advantages, had made a close blockade hazardous, the Admiralty adopted a strategy of distant surveillance, keeping the battle fleet in a position which commanded the North Sea and in instant readiness for action if the enemy appeared, and using her light craft for closer, but not close observation. This strategy was not as passive as it seemed to a critical public, eagerly expecting a new Trafalgar. It appreciated that Britain's general command of the sea was the pivot of the Allied cause, and that to hazard it by exposure to uncompensated losses was the negation of this supreme requirement. Therefore, while desiring battle and being ready for it, the Admiralty quietly set about its primary duty of maintaining the security of the ocean-routes, dealing with the sporadic threats to those routes, and thirdly, ensuring the safe passage to France of the British Expeditionary Force.

The idea of economic pressure exercised by sea-power was still in embryo, and not until a later phase did it crystallise into a formal doctrine, and the term "blockade" assume a new and wider definition. The attack on sea-borne commerce was deep-rooted in the tradition of the British Navy, and thus the transition to an indirect attack on the life of the enemy nation—her supplies of food and raw material—was an almost imperceptible progress. When this pressure was exercised against herself in a novel form and by a new weapon—the submarine, it was human if illogical that she should decry it as an atrocity. It was not easy for a conservative mind to realise that with the translation from a war of Governmental policies into a war of peoples, the indefinite code of military chivalry must be submerged by the primitive instincts let loose by a struggle for existence. But in 1914 this "absolute" war was still only a latent conception, and had no influence on the opening operations, great as was to be their influence on it.

The history of the naval struggle must be dated from July 26 1914, when the Admiralty, in view of the clouded international situation, sent orders to the fleet assembled for review at Portland not to disperse. If the review was a happy chance, the use made of it was one of the decisive acts and wisest judgments of the War, for while free from any of the provocation of an army mobilisation, it placed Britain in automatic control of the situation at sea. It was followed on July 29 by the unnoticed sailing of the fleet for its war stations in the North Sea, and warning telegrams to all squadrons abroad. To students of war and politics the lesson should not be lost, for whatever its other limitations, a professional force has this power of unprovocative readiness which a national force inevitably lacks. "Mobilisation" is a threat, creating an atmosphere in which peaceful argument withers and dies. Between negotiations and mobilisation there is a gulf, between mobilisation and war an imperceptible seam, and the act of any irresponsible can draw a nation across it.

Adml. Jellicoe, the new commander of the Grand Fleet, had one initial weakness to contend with; his base at Scapa was without defences against torpedo attack, and the fortified base being prepared at Rosyth was still incomplete. The historic concentration of British sea-power had been on the Channel coast, where lay the best prepared and defended harbours, and the Government had been slow to provide funds for bases on the North Sea to accompany the change in the concentration areas.

The danger compelled him to take his fleet west of the Orkneys, although it came down as far as the Forth during the transport of the expeditionary force to France, which was directly protected by the older battleships of the Channel Fleet, and by a layered system of patrols in the southern waters of the North Sea. This safe passage of the expeditionary force was the first direct achievement of the navy. The next followed on Aug. 29 when Beatty's battle-cruiser squadron and Tyrwhitt's destroyer flotillas made a swoop into the Bight of Heligoland, sank several German light cruisers, and achieved the much greater

indirect effect of confirming the Germans in their strictly defensive strategy—not an unmixed blessing, for it led them to concentrate on the development of submarine attack. Apart from this engagement the story of 1914 in the North Sea is a record of unceasing vigilance on the one side; of minor submarine and mine-laying successes and losses, on the other.

The war in the Mediterranean opened with a mistake that was to have far-reaching political consequences. Two of Germany's fastest ships were there, the battle-cruiser "Goeben" and the light-cruiser "Breslau," and received orders from Berlin to steer for Constantinople. They evaded the British efforts to cut them off, partly owing to inelasticity in applying the Admiralty instructions.

On the high seas the chase was more prolonged. Germany had not been allowed time to send out commerce-destroyers from home waters, but for some months her few cruisers on foreign service were a thorn in the side of the British Navy. It was not easy to reconcile the needs of the North Sea concentration with the duty of patrolling and protecting the tremendous length of sea-routes along which supplies as well as troops were flowing from India and the dominions to the support of the mother-country. By the destruction of the "Emden" on Nov. 9 the Indian Ocean was finally cleared, but this success was offset by disaster in the Pacific, where Cradock's cruiser squadron was crushed by the heavier metal of Von Spee's armoured cruisers, "Scharnhorst" and "Gneisenau." This set-back was, however, promptly redeemed by the Admiralty, who dispatched Sturdee with two battle-cruisers, "Inflexible" and "Invincible" on a lightning dash to the South Atlantic, while another battle-cruiser, "Australia," swept down from Fiji on Von Spee's rear. Trapped on Dec. 8 at the Falkland Isles, by this finely conceived surprise, Von Spee was sunk, and with him the last instrument of German naval power upon the oceans.

From this time onwards the ocean communications of Britain and her Allies were secured for trade, for supplies and for the conveyance of troops. But as to all ocean routes there must be a land terminus, the development of the submarine made this security gradually less effective than it seemed on the morrow of Sturdee's victory.

One result of Britain's early established command of the sea was that it gave her the opportunity to sweep up Germany's oversea colonies with little hindrance or expenditure of force. Their seizure was valuable in that it gave the Allies important assets to bargain with in case of an unfavourable issue to the War. In Aug. a New Zealand expedition took possession of New Guinea and Samoa, and the Australian Navy cleared several important German wireless stations in the Pacific Isles. Japan, entering the War on England's side, sent a fleet and army to besiege the German fortress of Tsing-tau in China, which capitulated after a seventy-six days' siege. In Africa, Togoland was occupied in Aug.; the Cameroons were a sterner obstacle, and not until the end of 1915 were the German forces conquered by joint British and French forces after a prolonged but economically conducted campaign. General Botha, the South African premier, once in arms against England, now for her, organised a force which conquered German South-West Africa. Almost concurrently Botha rendered a still greater service to the British cause by putting down the rebellion of a section of disaffected Boers, which save for the Irish rising of Easter 1916 was the only revolt within the borders of the Empire during these four trying years.

Only German East Africa, the largest and richest of Germany's colonies, remained. And that, owing to the difficulties of the country and the skill of von Lettow-Vorbeck, the German commander, was not to be completely subdued until the end of 1917. An expeditionary force was sent thither in Nov. to support the local British East African forces, and was repulsed at Tanga. Not until late in 1915 could the British Govt., occupied with greater problems, spare either the time or the force to deal with this hornet's nest.

*Submarine v. Blockade.*—The nature of the War at sea began to undergo definite changes early in 1915. During the

first phase Britain had been too busy in clearing the seas and maintaining the security of the sea-routes to devote much attention to the use of her sea command as an economic weapon against Germany. In any case her naval power was fettered by the artificial restrictions on blockade embodied in the Declaration of London of 1909, which the British Govt., with singular blindness, announced on the outbreak of war it would accept as the basis of its maritime practice. Their release from these self-imposed fetters was aided by Germany's action.

On Nov. 2 1914 a German battle-cruiser squadron made a raid on the Norfolk coast, as a reconnaissance to test the scope of Britain's naval defence. Another followed on Dec. 16 against the Yorkshire coast, bombarding Scarborough, Whitby and the Hartlepoons. Each time the Germans slipped away safely, but when they attempted a third, on Jan. 24, the English battle cruiser squadron, under Beatty, trapped them off the Dogger Bank, sank "Blücher" and badly damaged "Derfflinger" and "Seydlitz." Although the stroke missed full success, it convinced the Germans of the futility of their attrition strategy, and von Ingenohl, the commander of their High Sea Fleet, was replaced by Von Pohl, who proposed to Falkenhayn an offensive submarine campaign, which for success must be unlimited. As a result, on Feb. 18, Germany proclaimed the waters round the British Isles a war zone where all ships, enemy or neutral, would be sunk at sight. This gave Britain a lever to loosen the Declaration of London, and she replied by claiming the right to intercept all ships suspected of carrying goods to Germany, and bring them into British ports for search. This tightening of the blockade caused serious difficulties with neutrals, America especially, but Germany eased the friction by torpedoing the great liner "Lusitania" May 7 1915. The drowning of 1,100 people, including some Americans, was a spectacular brutality which shocked the conscience of the world, and appealed more forcibly to American opinion even than the desolation of Belgium. This act, succeeded by others, paved the way for the entry of the United States into the War, though it was to be later than seemed likely on the morrow of the tragedy.

*The Beginning of Air Attack.*—The same period witnessed the dawn of another new form of war which helped to drive home the new reality that the war of armies had become the war of peoples. From Jan. 1915 Zeppelin raids began on the English coast and reached their peak in the following winter, to be succeeded by aeroplane raids. The difficulty of distinguishing from the air between military and civil objectives smoothed the path for a development which, beginning with excuses, ended in a frank avowal that in a war for existence the will of the enemy nation, not merely the bodies of their soldiers, is the inevitable target.

*The Psychological Situation.*—The first psychological symptom of the World War, as it seemed to many, was an immeasurable sigh of relief. Had the peoples of Europe sat on the safety-valve too long? The war-weary mind of to-day cannot reconstruct the tension and anxiety, the strain and stress of hope and fear of the long years of the peace that was no peace and yet was not war. It may be read as a revolt of the spirit against the monotony and triviality of the every day round, the completion of a psychological cycle when the memories of past war have faded, and paved the way for the emergence and revival of the primal "hunting" instinct in man.

This first phase of enthusiasm was succeeded by one of passion, the natural ferocity of war accentuated by a form of mob spirit which is developed by a "nation in arms." The British Army was immune because of its professional character, whereas in the German Army, the most essentially "citizen," it gained scope because of the cold-blooded logic of the General Staff theory of war. With the coming of the autumn, a third phase became manifest, more particularly among the combatants. This was the momentary growth of a spirit of tolerance, symbolised by the fraternisation which took place on Christmas day, but this in turn was to wane as the strain of the War became felt and the reality of the struggle for existence came home to the warring sides.

### III. THE EVENTS OF 1915

*The Deadlock on Land.*—Well before the end of 1914, the reality of the deadlock on the western front was clear to the Governments and general staffs of the warring countries, and each was seeking a solution. The reaction varied in form and in nature according to the mental power and predisposition of the different authorities. With the Central Powers the opinion of Falkenhayn was the decisive factor, and the impression derived not merely from his critics but from his own account is that neither the opinion nor the direction was really clear as to its object. He was too obsessed with the principle of security at the expense of the principle of concentration, and in his failure to fulfil the second he undermined the foundations of the first.

On his appointment after the Marne reverse, he still adhered to the Schlieffen plan of seeking a decision in the west, but he did not follow the Schlieffen method of weakening his left wing in order to mass on the vital right wing. The Oct.-Nov. attack round Ypres was made largely with raw formations, while war-experienced troops lay almost idle between the Aisne and the Vosges. General Gröner, Chief of the Field Railways, even went so far as to submit a detailed plan to Falkenhayn for transferring six army corps to the right wing, but it was rejected. When we remember how close to breaking point was the Allied line at Ypres, it can only be said that for a second time the German supreme command saved the Allies. At this juncture, too, Ludendorff was pleading for re-inforcements to make his wedge-blow at the Russian flank near Łódź decisive, but Falkenhayn missed the chance by delaying until the Ypres failure had passed from assurance to fact.

Convinced at last of the strength of the Allied trench-barrier, Falkenhayn took the momentous decision to stand on the defensive in the west. But his object in so doing seems to have been vague. His feeling that the war must ultimately be decided in France led him to distrust the value, as he doubted the possibility, of a decision against Russia. Hence while he realised that the eastern front was the only practicable theatre for operations in the near future, he withheld the necessary reinforcements until forced to do so by the threatening situation of the Austro-Hungarian front. And even then he doled out reserves reluctantly and meagrely, enough to secure success but never in the quantity and the time for decisive victory.

It is to his credit, however, that he realised a long war was now inevitable, and that he set to work to develop Germany's resources for such a warfare of attrition. The technique of field entrenchment was carried to a higher pitch than with any other country, the military railways were expanded for the lateral movement of reserves, the supply of munitions and of the raw material for their manufacture was tackled so energetically and comprehensively, that an ample flow was ensured from the spring of 1915 onwards—a time when the British were only awakening to the problem. Here were laid the foundations of that economic organisation and utilisation of resources which was to be the secret of Germany's resisting power to the pressure of the British blockade. For the scientific grasp of the economic sphere in war Germany owed much to Dr. Walter Rathenau, a brilliant captain of industry. She was also a pioneer in the psychological sphere, for as early as the autumn of 1914, she launched a vast scheme of propaganda in Asia, to undermine British prestige and the loyalty of Britain's Mahommedan subjects. The defect of her propaganda, its crudeness, was less apparent when directed to primitive people than when applied to the civilised peoples of Europe and America.

The same period witnessed also the one great success for German diplomacy, the entry of Turkey into the War, although this was fundamentally due to a combination of pre-War causes with military events. Since 1909 the country had been under the control of the Young Turk party, to whom traditions, including that of friendship with Britain, were abhorrent. Germany, filled with her own dream of a Germanic Middle East—of which the Baghdad railway was the symbol, had skilfully exploited the opportunity to gain a dominating influence over the new rulers of Turkey. Their leader, Enver Pasha, had been

military attaché in Berlin, German instructors permeated the Turkish Army and fleet, and a definite understanding existed between Germany and the Young Turk leaders as to common military action—urged by the common bond of necessary safeguard against danger from Russia. The arrival of the "Goeben" and "Breslau" reinforced the moral pressure of Von Wangenheim, the German ambassador, and eventually on Oct. 29 the Turks committed definite acts of war, at Odessa against Russia, and in Sinai against Britain.

Falkenhayn has shown "the decisive importance of Turkey joining in the struggle"—first as a barrier across the channel of munition supply to Russia, and secondly as a distraction to the military strength of Britain and Russia. Under German dictation, Turkey struck as early as mid-Dec. against the Russians in the Caucasus, but Enver's over ambitious plan ended in disaster at the battle of Sarikamish. Turkey was no more fortunate in her next venture; to cut Britain's Suez Canal artery with the East. The Sinai desert was a check on an invasion in strength, and the two small detachments which got across were easily repulsed, at Ismailia and El Kantara, although allowed to make good their retreat. But if both these offensives were tactical failures, they were of great strategic value to Germany by fixing large Russian and British forces.

As an offset, perhaps more moral than material, to Turkey joining the Central Powers, Italy definitely threw over the artificial ties of the old Triple Alliance, and joined the Entente. On May 24 she declared war on Austria—her hereditary enemy, although avoiding an open breach with Germany. If her main object was to seize the chance of redeeming her kinsmen in Trieste and the Trentino from Austrian rule, there was also a spiritual desire to reassert her historic traditions. Militarily, however, her aid could not greatly affect the situation, for her army was unready to deliver a prompt blow, and the Austrian frontier was a mountainous obstacle of great natural strength.

On the Entente side the reality of the trench deadlock produced different and diverse reactions. If the desire to hold on to her territorial gains swayed German strategy, the desire to recover her lost territory dominated French strategy. It is true that their mental and material concentration on the western front, where lay the main armed force of the enemy, was justified by military tenets, but without any key to unlock the barrier they were merely knocking themselves to pieces. Winter attacks in Artois, on the Aisne, in Champagne and the Woëvre afforded costly proof, and against the Germans' skill in trench-fighting Joffre's "nibbling" was usually attrition on the wrong side of the balance sheet. As for any new key, the French were singularly lacking in fertility of idea.

Britain's trouble was rather an excess of fertility, or rather an absence of concentration in choosing and bringing to fruition these mental seeds. Yet in great measure this failing was due to the obscurantism of professional opinion, whose attitude was that of blank opposition rather than expert guidance.

British-inspired solutions to the deadlock crystallised into two main groups, one tactical, the other strategical. The first was to unlock the trench barrier by producing a machine invulnerable to machine-guns and capable of crossing trenches, which would restore the tactical balance upset by the new preponderance of defensive over offensive power. The idea of such a machine was conceived by Colonel Swinton in Oct. 1914, was nourished and tended in infancy by Mr. Winston Churchill, then First Lord of the Admiralty, and ultimately after months of experiment hampered by official opposition came to maturity in the tank of 1916.

The strategical solution was to go round the trench barrier. Its advocates—who became known as the "eastern," in contrast to the "western" school—argued that the enemy alliance should be viewed as a whole, and that modern developments had so changed conceptions of distance and powers of mobility, that a blow in some other theatre of war would correspond to the historic attack on an enemy's strategic flank. Further, such an operation would be in accordance with the traditional amphibious strategy of Britain, and would enable it to exploit the

advantage of sea-power which had hitherto been neglected. In Oct. 1914 Lord Fisher, recalled to the office of First Sea Lord, had urged a plan for a landing on the German coast. In Jan. 1915, Lord Kitchener advocated another, for severing Turkey's main line of eastward communication by a landing in the Gulf of Alexandretta. The post-War comments of Hindenburg and Enver show how this would have paralysed Turkey. It could not, however, have exercised a wider influence, and it was anticipated by another project—partly the result of Churchill's strategic insight and partly due to the pressure of circumstances.

*The Dardanelles Expedition.*—This was the Dardanelles expedition, about which controversy has raged so hotly that the term just applied to Churchill may be disputed by some critics. This is answered by the verdict of Falkenhayn himself: "If the Straits between the Mediterranean and the Black Sea were not permanently closed to Entente traffic, all hopes of a successful course of the War would be very considerably diminished. Russia would have been freed from her significant isolation . . . which offered a safer guarantee than military successes . . . that sooner or later a crippling of the forces of this Titan must take place. . . . automatically." The fault was not in the conception, but in the execution. Had the British used at the outset even a fair proportion of the forces they ultimately expended in dribbles, it is clear from Turkish accounts that victory would have crowned their undertaking.

On Jan. 2 1915 Kitchener received an appeal from the Grand Duke Nicholas for a diversion which would relieve the Turkish pressure on Russia's army in the Caucasus. Kitchener felt unable to provide troops and suggested a naval demonstration against the Dardanelles, which Churchill, appreciating the wider strategic and economic issues, proposed to convert into an attempt to force the passage. His naval advisers, if not enthusiastic, did not oppose the proposal and in response to a telegram the admiral on the spot, Carden, submitted a plan for a methodical reduction of the forts and clearance of the mine-fields. Fisher, while clinging to his own North Sea project strongly advocated a combined naval and military expedition. On Jan. 13 the War Council decided for a naval expedition to "take the Gallipoli peninsula, with Constantinople as its objective." A naval force, mainly of obsolete vessels was got together with French aid, and after preliminary bombardment, entered the straits on March 18. Drift mines, however, caused the sinking of several ships, and the attempt was abandoned.

It is a moot point whether a prompt renewal of the advances would not have succeeded, for the Turkish ammunition was exhausted, and in such conditions the mine obstacle might have been overcome. But the new naval commander, Admiral de Robeck decided against it, unless military aid was forthcoming. Already, a month before, the War Council had determined on a joint attack, and began the despatch of a military force under Sir Ian Hamilton. But as the authorities had drifted into the new scheme, so were they tardy in releasing the necessary troops, and even when sent, in inadequate numbers, several more weeks delay had to be incurred—at Alexandria—in order to redistribute the force in its transports suitably for tactical action. Worst of all, this fumbling policy had thrown away the chance of surprise, which was vital for a landing on an almost impregnable shore. When the preliminary bombardment took place in Feb., only two Turkish divisions were at the straits, this was increased to four by the date of the naval attack, to six when Hamilton was at last able to attempt his landing. For this he had only four British divisions and one French division—actually inferior in strength to the enemy in a situation where the inherent preponderance of defensive over offensive power was multiplied by the natural difficulties of the terrain. His weakness of numbers and his mission of aiding the passage of the fleet compelled him to choose a landing on the Gallipoli peninsula in preference to one on the mainland or on the Asiatic shore; and the rocky coastline limited his possible landing places.

On April 25 he made his spring, at the southern tip of the peninsula near Cape Hellas and—with Australian and New Zealand troops—near Gaba Tepe, some 15 m. up the Aegean

coast; the French, as a diversion, made a temporary landing at Kum Kale on the Asiatic shore. The troops effected the impossible and made good their lodgment on beaches strewn with barbed wire and swept by machine-guns. But the momentary asset of tactical surprise had passed, the difficulties of supply were immense, while the Turks held the commanding heights and were able to bring up their reserves. The invaders managed to hold on to their two precarious footholds, but they could not expand them appreciably, and the stagnation of trench-warfare set in. They could not go on, and national prestige forbade them to go back.

Ultimately, in July, the British Govt. decided to send a further five divisions to reinforce the seven by now on the peninsula. By the time they arrived the Turkish strength in the region had also risen to 15 divisions. Hamilton decided on a double stroke—a reinforced blow from Gaba Tepe and a new landing at Suvla Bay a few miles north—to sever the middle of the peninsula and secure the heights commanding the Narrows. He deceived the Turkish command and achieved surprise (Aug. 6), but the first blow failed and the second lost a splendid chance by the inexperience of the troops and still more the inertia and fumbling of the local commanders. For over 36 hours, before reserves arrived, only one and a half Turkish battalions barred the path. Energetic new commanders, for whom Hamilton had previously asked, were sent out when the opportunity had passed. The British were once more condemned to hang on to tenuous footholds, and with the autumn rains setting in their trials were increased. The Government had lost faith and were anxious to withdraw, but fear of the moral effect delayed their decision. Hamilton was asked for his opinion, however, and when he pronounced in favour of continuing—in which course he still had confidence—he was replaced by Sir Charles Monro, who immediately declared for evacuation. Kitchener was then sent out to investigate, and on his verdict a withdrawal was sanctioned and carried out from Suvla and Anzac on the night of Dec. 18–9 and from Hellas on that of Jan. 8–9. If the bloodless evacuation was an example of masterly organisation and co-operation it was also a proof of the greater ease of such operations in modern warfare. Thus the curtain rang down on a sound and farsighted conception marred by a chain of errors in execution almost unrivalled even in British history.

While the British were striving to unlock the back door to Russia, the Germanic Powers were hammering their Russian allies, whose resistance was collapsing in large measure from a lack of munitions which could only be made good by foreign supplies through that locked entrance, the Dardanelles. On the eastern front, the campaign of 1914 had shown that a German force could count on defeating any larger Russian force, but that when Russians and Austrians met on an equality victory rested with the Russians. Falkenhayn was forced, reluctantly, to despatch German reinforcements as a stiffening to the Austrians, and thus was dragged into an offensive in the East rather than adopting it as a clearly defined plan. Ludendorff, in contrast, had his eyes firmly fixed on the ultimate object, and from now on advocated unceasingly a whole-hearted effort to break Russia. Ludendorff's was a strategy of decision, Falkenhayn's a strategy of attrition.

In the conflict of wills between these two men lies the clue to the resultant strategy of Germany—highly effective, yet not decisive. On the Russian side the plan embodied the lessons of experience and was soundly conceived, but the means were lacking and the instrument defective. The Grand Duke Nicholas aimed to secure both his flanks solidly before attempting a fresh blow towards Silesia. From Jan. until April the Russian forces on the southern flank of the Polish salient strove to gain possession of the Carpathians and the gateways into the Hungarian plain. But the Austrians, with a German infusion, parried their efforts, and the loss was disproportionate to the small gains. The long-besieged fortress of Przemyśl, however, at last fell into their hands. In northern Poland the Russians were preparing to strike upwards at East Prussia, when they were forestalled by a fresh Ludendorff stroke eastwards towards the frontier of

Russia proper. The blow was launched on Feb. 7 over snow-buried roads and frozen swamps, and was distinguished by the envelopment of four Russian divisions in the Augustovo forests. Moreover, it extracted the sting from the Russian attack further west.

These moves were, however, merely a "curtain-raiser" to the real drama of 1915. But before turning to this it is necessary to glance at events on the western front, the importance of which is partly as a sign post to the future and partly because of their reaction on the eastern front. While a way round the trench barrier was being sought in Gallipoli and experiments on a novel key were being carried out in England, the Entente commands in France were trying more orthodox solutions. The most significant was the British attack at Neuve Chapelle on March 10. Here a heavy concentration of artillery was secretly assembled, and an intense bombardment of half an hour's duration delivered on the German trenches, after which the artillery lengthened their range and dropped a curtain of fire to prevent the reinforcement of the enemy's battered trenches, which were rapidly overrun by the infantry.

Complete surprise was attained and most of the first positions captured, but control broke down, reserves were late in coming up, and the opportunity of exploiting the initial success vanished. A further factor was that the narrowness of the attack sector made the breach more easy for the defenders to close, although this defect was unavoidable owing to the general shortage of munitions. The British authorities had been slower than the Germans to awaken to the scale of ammunition supply required for this new warfare, and the shortage of shells became so obvious in the spring of 1915 as to lead to a public outcry which culminated in the establishment of a Ministry of Munitions, under Mr. Lloyd George, to co-ordinate and develop both manufacture and the supply of raw materials. Apart from shells, the crudeness and inferiority of all the British trench-warfare weapons compared with the Germans, made such a radical reorganisation overdue, and its urgency was emphasised by the near approach of the time when Britain's new national armies would take the field. If the task was undertaken late, it was carried out with energy and thoroughness, and by 1916 the flow of munitions reached a volume, still expanding, which finally removed any material handicap on the strategy of the British leaders.

The tactical sequel of Neuve Chapelle was less fortunate. It was clear that the small-scale experiment had only missed success by a narrow margin and that there was scope for its development. But the Entente commands missed the true lesson, which was the surprise attainable by a short bombardment that compensated its brevity by its intensity. And only partially did they appreciate that the sector attacked must be sufficiently wide to prevent the defender's artillery commanding, or his reserves closing the breach. Instead, they drew the superficial deduction that mere volume of shell-fire was the key to success. Not until 1917 did they revert to the Neuve Chapelle method. It was left to the Germans to profit by the experience against the Russians in May.

But before that came, the western front was destined to increase the tally of military blunders. In the first, it was the Germans' turn to find and misuse a new key to the trench deadlock. This was the introduction of gas, and, unlike the British introduction of tanks later, the chance, once forfeited, did not return, owing to the relative ease of providing an antidote. In a local attack in Poland on Jan. 31, the Germans had tried the use of gas-shells, but the experiment had been a failure owing to the nullifying effect of the intense cold. At the next attempt it was discharged from cylinders owing to the failure of the authorities to provide the inventor, Haber, with adequate facilities for the manufacture of shells. Further, the initial disappointment led the German command to place little trust in its value. In consequence, when discharged against the French trenches at Ypres on April 22, there were no reserves at hand to pour through the wide breach it created. A strange green vapour, a surging mass of agonised fugitives, a four miles gap without a living

defender—such was the sequence of events. But the heroic resistance of the Canadians on the flank of the breach and the prompt arrival of English and Indian reinforcements saved the situation in the absence of German reserves.

The chlorine gas originally used was undeniably cruel, but no worse than the frequent effect of shell or bayonet, and when it was succeeded by improved forms of gas both experience and statistics proved it the least inhumane of modern weapons. But it was novel and therefore labelled an atrocity by a world which condones abuses but detests innovations. Thus Germany incurred the moral odium which inevitably accompanies the use of a novel weapon without any compensating advantage (see *CHEMICAL WARFARE*).

On the Entente side, wisdom would have counselled a period of waiting until their munition supply had grown and the new British armies were ready, but the desire to regain lost territory and the duty of relieving the pressure on Russia, combined with an ill-founded optimism to spur Joffre to premature offensives. The German losses were exaggerated, their skill and power in defence underrated, and a series of diffused and unconnected attacks were made. The chief was by the French between Lens and Arras, under Foch's direction, and the earlier experience of failure to penetrate beyond the first positions was repeated. Even more futile were the British attacks at Festubert early in May.

The effect of these attacks was, however, to convince even the dubious Falkenhayn of the strength of his Western line and of the remoteness of any real menace from the Franco-British forces. His offensive on the eastern front had already opened. Tactically unlimited, its strategical object was at first only the limited one relieving the pressure on the Austrian front and, concurrently, reducing Russia's offensive power. Falkenhayn judged a rupture of the Russian centre to be the best means to this end, and chose the Dunajec sector between the upper Vistula and the Carpathians as offering the least obstacles to an advance and best protection to the flanks of a penetration. The break-through was entrusted to Mackensen, whose force comprised the newly formed German XI. Army—with divisions from the West, and the IV. Austro-Hungarian Army. The Ypres gas attack and a large cavalry raid from East Prussia were initiated to cloak the concentration on the Dunajec, of 10 divisions and 1,500 guns against a front weakly held and lacking rear lines of trenches.

On May 2, after an intense bombardment had flattened the Russian trenches, the attack was launched and swept through with little opposition. The surprise was complete, the exploitation rapid, and despite a gallant stand on the Wisłoka river, the whole line along the Carpathians was rolled up, until on May 14 the advance reached the San, 80 m. from its starting point. Defeat almost turned into disaster when this was forced at Jaroslaw, but the impetus of the advance had momentarily spent itself and reserves were lacking. A new factor was introduced by Italy's declaration of war against Austria, but Falkenhayn persuaded the Austrian command, with some difficulty, not to move troops from the Russian front, and to maintain a strict defensive on their Italian frontier, which was secured by the mountain barrier. He realised that he had committed himself too far in Galicia to draw back, and that only by bringing more troops from France could he hope to fulfil his object of transferring troops back there, as this could only be possible when Russia's offensive power was crippled and her menace to Austria removed. Strengthened by these reinforcements, Mackensen attacked again in co-operation with the Austrians, retook Przemyśl on June 3 and captured Lemberg on June 22, cutting the Russian front into two separated portions.

But the Russians, from their vast man-power resources, had almost made good the loss of 400,000 prisoners, and Falkenhayn's anxiety about the stability of his Austrian allies decided him to continue the offensive, although still with limited objects and with one eye on the situation in France. He changed its direction, however, from eastwards to northwards, between the Bug and Vistula, where lay the main Russian forces. In conjunction,

Hindenburg was ordered to strike southeast from East Prussia, across the Narew and towards the Bug. Ludendorff disliked the plan as being too much of a frontal attack; the Russians might be squeezed by the closing in of the two wings but their retreat would not be cut off. He urged once more his scheme for a wide enveloping manoeuvre through Kovno on Vilna and Minsk, but Falkenhayn rejected it, fearing that it would mean more troops and a deeper commitment. The result justified Ludendorff's expectation—the Grand Duke extricated his troops from the Warsaw salient before the German shears could close on him. Falkenhayn, on the other hand, considered that Ludendorff had not put his full weight into the attack.

Nevertheless, 750,000 prisoners had been taken by the middle of August, Poland had been occupied, and Falkenhayn decided to break off large scale operations on the eastern front. Bulgaria's entry into the War was now arranged and he wished to support the combined attack of Austria and Bulgaria against Serbia, as well as to transfer troops back to meet the French offensive expected in September. Mackensen was sent to the Serbian front and Ludendorff was given a belated permission to carry out his Vilna scheme, with such resources as he had, but as an independent operation.

It began on Sept. 9, Von Below's Army of the Niemen and Eichhorn's X. Army forming two great horns which gored their way into the Russian front, the one east towards Dvinsk and the other southeast towards Vilna. The Russians were driven back in divergent directions and the German cavalry advancing between the horns far overlapped Vilna and drew near the Minsk railway. But the German strength was slender, the Russians free to concentrate against this isolated menace, and in face of the stiffening resistance Ludendorff took the wise course of suspending operations. The crux of the situation was that the Russian armies had been allowed to draw back almost out of the net before the long delayed Vilna manoeuvre was attempted; the degree of success attained with such weak forces was confirmation of its practicability and of Ludendorff's claim that a powerful blow delivered while the Russians were deeply enmeshed in the Polish salient might have annihilated the armed force of Russia. She had been badly lamed, but not destroyed, and although never again a direct menace to Germany, she was able to delay the full concentration of German strength in the West for two years, until 1918. Falkenhayn's cautious strategy was to prove the most hazardous in the long run, and indeed to pave the way for Germany's bankruptcy.

Thus, at the end of Sept., the Russian retreat, after a nerve-racking series of escapes from the salients which the Germans systematically created and then sought to cut off, came to a definite halt on a straightened line, stretching from Riga on the Baltic to Czernowitz on the Rumanian frontier. But the Russian armies had gained this respite at a ruinous price, and their Western allies had effected little in repayment of Russia's sacrifice on their behalf in 1914. For the Franco-British relief offensive of Sept. 25 had been no more fruitful than its predecessors. The main blow was launched by the French in Champagne, in conjunction with a Franco-British attack on either side of Lens. One fault was that the sectors were too far apart to have a reaction on each other, but a worse was that the command tried to reconcile two irreconcilable factors—they aimed at a break through but preceded it with a prolonged bombardment which gave away any chance of surprise. Both attacks gained the front German positions without difficulty, but then delay in bringing reserves forward allowed the German reserves to close the gaps, a task simplified by the narrowness of the attack frontage. The slight gains of ground in no way compensated for the heavy price paid for them. The British share in this offensive is, however, notable as marking the appearance in strength of the New Armies; at Loos they were "blooded" and if inexperience detracted from their effectiveness, their courage and driving force were an omen of Britain's power to improvise a national effort comparable with the long-created military machines of the Continent.

The direction of this effort inspired less confidence, and Sir John French gave place to Sir Douglas Haig as Commander-in-Chief, just as already in Sept. the Russian command had been transferred from the Grand Duke Nicholas, nominally to the Tsar, as a moral symbol, but actually to Gen. Alexeiev, the new chief of staff.

*The Conquest of Serbia, Oct. 1915.*—While stalemate, although with marked changes beneath the surface, once more settled in on both the eastern and western fronts, the latter months of 1915 witnessed fluid operations elsewhere which were to have an uncalculated influence on the War.

Austria had proved capable of holding the Italians on the Isonzo, and once the Russian danger began to fade under the pressure of the summer offensive, her command was anxious to deal with Serbia conclusively. Austria's attempted invasions in Aug. and Sept. 1914 and again in Nov., had been brusquely repulsed by Serbian counter-strokes, and it was not pleasant for a great Power, especially one with so many Slav subjects, to swallow such military rebuffs. Her impatience coincided with Falkenhayn's desire to gain direct railway communications with Turkey, hard pressed at the Dardanelles. Throughout the summer the rival coalitions had been bidding for Bulgaria's support, and in this bargaining the Entente suffered the moral handicap of military failure and the material handicap caused by Serbia's unwillingness to give up any part of Macedonia—of which she had despoiled Bulgaria in 1913. As Austria had no objection to offering territory that belonged to her enemy, Bulgaria accepted her bid. This accession of strength enhanced the chance of a decision against Serbia and in Aug. Falkenhayn decided to reinforce Kövess's Austrian III. Army with Gallwitz's German XI. Army from the Russian front. In addition two Bulgarian Armies were available. Mackensen was sent to direct the operations. To meet this new threat Serbia, apart from her own relatively small forces, had only a treaty guarantee of Greek aid and promises from the Entente Powers. The first disappeared with the fall of Venizelos, the pro-Ally Greek premier, and the second, as usual, was too late.

On Oct. 6 1915 the Austro-German Armies attacked southwards across the Danube, with a flanking movement across the Drina on the right. The sturdy resistance of the Serbs in delaying actions, and the natural difficulty of the mountainous country, checked the advance, but before Franco-British reinforcements could arrive, the Bulgarian Armies struck westwards into southern Serbia, across the rear of the main Serbian Armies. This drove a deep wedge between the Serbs and their allies, moving up from Salonika, and automatically loosened the props of the resistance in the north. With their line bent at both ends until it resembled a vast bow, threatened with a double envelopment, and with their retreat to the south cut off, the Serbian Armies decided to retire west through the Albanian mountains. Those who survived the hardships of this mid-winter retreat were conveyed to the island of Corfu, and after being re-equipped and reorganised, joined the Entente force at Salonika in the spring of 1916. The conquest of Serbia, though not as it proved of Serbian military power, relieved Austria of danger on her southern frontier, and gave Germany free communication and control over a huge central belt from the North Sea to the Tigris. For the Entente this campaign dug a military sump-pit, which for three years was to drain their military resources, there to lie idle and ineffective. Yet ultimately that sump-pit was to overflow and wash away one of the props of the Central Alliance.

*The Salonika Expedition.*—When at the beginning of Oct. the Entente Govts. had awakened to Serbia's danger, British and French divisions had been despatched hurriedly from Gallipoli to Salonika, which was the only channel of aid to Serbia by the railway to Uskub. Under the command of Gen. Sarrail, the advanced guard of this relieving force pressed up the Vardar and over the Serbian frontier, only to find that the Bulgarian wedge had cut them off from the Serbians, and they were forced to fall back on Salonika, pursued by the Bulgarians. On military grounds an evacuation of Salonika was indicated, but political reasons induced the Allies to remain. The Darda-

nelles failure had already diminished their prestige, and by convincing the Balkan states of German invincibility had decided Bulgaria to enter the War and Greece to break her treaty with Serbia. To evacuate Salonika would be a further loss of prestige, whereas by holding on they could check German influence over Greece, and maintain a base of operations from which to aid Rumania if, as expected, she entered the War on their side. To this end the Salonika force was augmented with fresh British and French divisions, as well as contingents from Italy and Russia, and there also the rebuilt Serbian Army was brought. But apart from the capture of Monastir in Nov. 1916 and an abortive attack in April 1917, the Entente force made no serious offensive until the autumn of 1918. Its innocuousness was partly due to the natural difficulties of the country—the chain of mountain ridges which guarded the approach to the Balkans, partly to the feeling of the Allied Govts. that it was a bad debt, and partly to the personality of Sarraïl, whose conduct and reputation for political intrigues failed to command the confidence and co-operation essential if such a mixed force was to “pull its weight.” On their side the Germans were content to leave it in passivity, under guard of the Bulgarians, while they steadily withdrew their own forces for use elsewhere. With gentle sarcasm they termed Salonika their “largest internment camp,” and with half a million allied troops locked up there the jibe had some justification—until 1918.

*The Mesopotamia Expedition to the Fall of Kut.*—Nor was Salonika the only “drain” opened in 1915. Mesopotamia was the site of a fresh diversion of force from the centre of military gravity, and one which could only be excused on purely political grounds. It was not, like Salonika and the Dardanelles, begun to relieve a hard-pressed ally, nor had it the justification of the Dardanelles expedition of being directed at the vital point of one of the enemy states. The occupation of Mesopotamia might raise British prestige, and it might annoy Turkey, but it could not endanger the power of resistance. Although its origin was sound, its development was another example of “drift,” due to the inherent faultiness of Britain’s machinery for the conduct of war.

The oil-fields near the Persian Gulf were of essential importance for Britain’s oil supply, and thus when war with Turkey was imminent, a small Indian force, of one division, was despatched to safeguard them. To fulfil this mission effectively it was necessary to occupy the Basra vilayet at the head of the Persian Gulf, in order to command the possible lines of approach.

On Nov. 21 1914 Basra was captured, but the rising stream of Turkish reinforcements compelled the Indian Govt. to add a second division. The Turkish attacks in the spring of 1915 were repulsed, and the British commander, Gen. Nixon, judged it wise to expand his footing, for greater security. Townshend’s division was pushed up the Tigris to Amara, gaining a brilliant little victory, and the other division up the Euphrates to Nasiriya. Southern Mesopotamia was a vast alluvial plain, roadless and railless, in which there were two great rivers formed the only channels of communication. Thus a hold on Amara and Nasiriya covered the oil-fields; but Nixon and the Indian Govt., inspired by these successes, decided to push forward to Kut-el-‘Amara, a move which was 180 m. further into the interior but had a partial military justification in the fact that at Kut the Shatt-el-Hai, issuing from the Tigris, formed a link with the Euphrates by which Turkish reserves could be transferred from one river line to the other.

Townshend was sent forward in Aug., defeated the Turks near Kut, and his cavalry carried the pursuit to Aziziya, half way to Baghdad. Enthusiasm spread to the home government, anxious for a moral counterpoise to their other failures, and Nixon received permission for Townshend to press on to Baghdad. But after an indecisive battle at Ctesiphon, the growing superiority of the Turkish strength, compelled him to retreat to Kut. Here, isolated far from help, he was ordered to remain, as several fresh divisions were being sent to Mesopotamia. Kut was invested by the Turks on Dec. 8 1915, and the relieving forces battered in vain against the Turkish lines covering the approach

on either bank of the Tigris. The conditions were bad, the communications worse, the generalship faulty, and at last on April 29 1916 Kut was forced to surrender. However unsound the strategy which despatched Townshend, it is just to emphasise that its actual achievements in face of superior numbers, with inadequate equipment and primitive communications, and utterly isolated in the heart of an enemy country, wrote a glorious page of British history. When these handicaps are compared with the four to one superiority in number, and highly organised supply system of the force which ultimately took Baghdad, the comparison explains the awe in which Townshend and his men were held by the Turks.

*The Home Front 1915.*—Perhaps one of the most significant landmarks of the transition of the struggle from a “military” to a “national” war was the formation of a National Ministry in Britain, which occurred in May 1915. For the prototype of Parliaments to abandon the deep-rooted party system and pool the direction of the War was proof of the psychological upheaval of traditions. The Liberal Prime Minister, Asquith, remained, but the real lead began to pass insensibly into other hands, notably those of Mr. Lloyd George. Mr. Churchill, whose vision had saved the menace to the Channel ports and made possible the future key to the deadlock, was shelved, as already had been Haldane, the creator of the Expeditionary Force.

Political changes were general in all countries, and were symptomatic of a readjustment of popular outlook. The early fervour had disappeared, and been replaced by a dogged determination which if natural to the British was in strange contradiction to what had been reported of the French temperament.

Economically, the strain had yet to be felt severely by any country. Finance had shown an unexpected power of accommodation, and neither the blockade or the submarine campaign had seriously affected the food supply. If Germany was beginning to suffer some shortage, her people had more tangible omens of success to fortify their resolution than had their enemies.

#### IV. FROM VERDUN TO THE ENTRY OF AMERICA

*Verdun 1916.*—In 1914 the centre of gravity of the World War had been on the western front, in 1915 it shifted to the eastern front, and in 1916 once more moved back to France. Although the Entente had dissipated some of their strength in Salonika and Mesopotamia, the rising tide of England’s new armies and of her munition supplies promised the power for an effort far larger in scale than before to break the trench deadlock. Measures had also been taken to keep these new divisions up to strength. Although the principle of voluntary enlistment had not yet been abandoned, the method was systematised and based on a National Register. This scheme, launched in Oct. 1915 under the *aegis* of Lord Derby, aimed to reconcile the demands of the army with the needs of industry, calling up men by groups as they were wanted, and taking single men first. But the response among the latter was not adequate to preserve this graduated principle and in Jan. 1916 by the Military Service Act, the voluntary system—system is hardly the correct term—was replaced by conscription.

At the close of 1915 the Entente command adopted the principle of a simultaneous general offensive in 1916 by France, Britain, Russia and Italy. In view of the rawness of the British troops, it was recognised that time must be allowed for training, and that the offensive could not begin before the summer of 1916, although it was hoped to carry out preliminary attacks to wear down the enemy’s strength.

But German action was to dislocate this scheme, and only the British share came fully into operation, and not even that into full effect. Falkenhayn was about to fulfil his long-cherished plan for a Western offensive, but with characteristic limitations. Always a believer in the strategy of attrition, he now carried this ruling idea into tactics, and produced the new form of attack by methodical stages, each with a limited objective. In a memorandum to the German Emperor at Christmas 1915 he argued that England was the staple of the enemy alliance. “The history of the English wars against the Netherlands, Spain,

France and Napoleon is being repeated. Germany can expect no mercy from this enemy, so long as he still retains the slightest hope of achieving his object." Save by submarine warfare, however, England and her army were out of reach, for her sector of the front did not lend itself to offensive operations. "In view of our feelings for our arch enemy in the War that is certainly distressing, but it can be endured if we realise that for England the campaign on the Continent . . . is at bottom a side-show. Her real weapons here are the French, Russian and Italian armies." He regarded Russia as already paralysed, and Italy's military achievements as unlikely to affect the situation. "Only France remains." "France has almost arrived at the end of her military effort. If her people can be made to understand clearly that in a military sense they have nothing more to hope for, breaking-point would be reached, and England's best sword knocked out of her hand." He added that a break-through in mass was unnecessary, and that instead the Germans should aim to bleed France to death by choosing a point of attack "for the retention of which the French command would be compelled to throw in every man they have." Such objectives were either Belfort or Verdun, and Verdun was chosen, because it was a menace to the main German communications, because it offered a salient and so cramped the defender, and because of the moral effect if so renowned a place was lost to France.

The keynote of the tactical plan was a continuous series of limited advances which by their menace should draw the French reserves into the mincing-machine of the German artillery. And each of these advances was itself to be secured from loss by an intense artillery bombardment, brief for surprise and making up for its short duration by the number of batteries and their rapidity of fire. By this means the objective would be taken and consolidated before the enemy could move up his reserves for counter-attack. Although the French Intelligence branch at general headquarters gave early warning of the German preparations, the Operations branch were so full of their own offensive schemes that the warning fell on deaf ears. Further, the easy fall of the Belgian and Russian fortresses had led to a commonly held view that fortresses were obsolete, and Joffre, persuading the French Govt. to declass Verdun as a fortress, had denuded it of guns and troops. The forts were only used as shelters and the trench lines which took their place were inadequate and in poor repair. Yet eight months' bombardment was to leave the forts undamaged! At 7:15 A.M. on Feb. 21 the German bombardment began, on a front of 15 m., and progressively trenches and wire were flattened out or upheaved in a chaos of tumbled earth, giving to the countryside a weird resemblance to the surface of the moon. At 4:45 P.M. the German infantry advanced, although the first day only on a 2½ m. front. From then until Feb. 24 the defenders' line east of the Meuse was crumbled away as by the erosion of the tide.

"Operations" still argued that it was only a feint, but Joffre decided to send Castelnau to discover the true situation and with full powers to act. Castelnau swung back the right flank but ordered the line of the forts to be held at all costs and entrusted the defence to Pétain, for whose use a reserve army was assembled. Pétain's first problem was not so much defence as supply—the German heavy guns had closed all avenues into the salient except one light railway and the Bar-le-Duc road. While gangs of territorial troops worked night and day to keep this in repair and widen it, Pétain organised the front into sectors and threw in repeated counter-attacks, which helped by the narrowness of the front at least slowed down the advance. Falkenhayn sought, somewhat late, to widen the front, and on March 6 the Germans extended the attack to the west bank of the Meuse. But the defence was now stiffening, the numbers balanced, and the immediate thrust to Verdun was checked.

A slight lull followed, and during it the Allies of France made efforts to relieve the pressure on her. The British took over the Arras front from the French X. Army, the Italians made their fifth attack, though in vain, on the Isonzo front, and the Russians hurled untrained masses on the German front at Lake Narocz, near the Vilna, once more gallantly sacrificing them-

selves to help their Allies. The slight gains were soon lost through a counter-stroke. These efforts did not prevent Falkenhayn pursuing his attrition offensive at Verdun. The advances were slight but they were cumulative in effect, and the balance of loss turned definitely against the defenders. On June 7 Fort Vaux fell, and the German tide crept ever closer to Verdun, seeming to the anxious watchers to resemble the forces of nature rather than of men. And in the Asiago region, Conrad had launched his offensive against Italy's Trentino flank.

*Brusilov's Offensive.*—Again Russia came to the rescue. Without warning, because without any special concentration of troops, Brusilov, commanding the southwestern Russian front, advanced against the Austrian IV. Army near Luck and the VII. Army in the Bukovina, whose resistance collapsed at the first shock. In three days Brusilov took 200,000 prisoners. This last vital effort of the Russian Army in the War had important consequences. It stopped the Austrian attack on Italy, already impaired by an Italian riposte. It compelled Falkenhayn to withdraw troops from the western front, and so abandon his plan for a counter-stroke against the British offensive preparing on the Somme, as well as the hope of nourishing his Verdun attrition process. It led Rumania to take her fateful decision to enter the War on the Entente side, and caused the supersession of Falkenhayn in the supreme command and his replacement by Hindenburg and Ludendorff. Although Rumania's entry was the ostensible reason, the underlying one was the fact that Falkenhayn's "limited" strategy in 1915 had made possible the Russian recovery which stultified the strategy of 1916. Falkenhayn was history's latest example of the folly of half-measures, the ablest and most scientific general—"penny-wise, pound foolish"—who ever ruined his country by a refusal to take calculated risks. Brusilov's offensive continued for three months with fair success, but reserves were not at hand for immediate exploitation, and before they could be moved down from the north the Germans were patching up the holes. His later efforts were never so dangerous, and his ultimate loss of 1,000,000 casualties completed the virtual ruin of Russia's military power.

*The Somme.*—Great as was the influence of Brusilov's offensive on German strategy, its effect on the Verdun situation was less immediate, and on June 23 the Germans almost reached the Belleville height, the last outwork of Verdun. Pétain made all ready for an evacuation of the east bank of the Meuse, though to his troops he showed no sign of anxiety, and ever repeated the now immortal phrase, "On les aura!"

But on July 1 the long-planned offensive on the Somme began, and from that day on the Germans at Verdun received no new divisions, and their advance died away from pure inanition. Nevertheless, although the Germans at Verdun had fallen short of their object, moral and material, they had so drained the French Army that it could play but a slender part in the Allied plan for 1916. The British had now to take up the main burden of the struggle, and the consequence was to limit both the scope and effect of the Entente strategy.

On July 1 after a week's prolonged bombardment the British attacked with 15 divisions on a front of 15 m. north of the Somme, and the French with five divisions on a front of eight m., mainly south of the river, where the German defence system was less highly developed. The unconcealed preparations and the long bombardment had given away any chance of surprise, and in face of the German resistance, weak in numbers but strong in organisation, the attack failed along most of the British front. Owing to the dense and rigid wave formations that were adopted the losses were appallingly heavy. Only on the south of the British front, near Fricourt and Montauban, did the attack gain a real footing in the German defences. The French, with slighter opposition, made a deeper advance.

This setback negated the original idea of a fairly rapid penetration to Bapaume and Cambrai, and the Allied command adopted the attrition method of limited advances aimed to wear down the German strength. The attack was resumed on the southern British flank alone, and on July 14 the capture of the

Germans' second position offered the chance of exploitation, which was not taken. From now onward a methodical but costly advance continued, and although little ground was gained the German resistance was seriously strained when the early onset of winter rains suspended operations in November. The effect, however, can be exaggerated, for it did not prevent the Germans withdrawing troops for the attack on Rumania. But in one respect the Somme shed a significant light on the future, for on Sept. 15 the first tanks appeared. Their early employment before large numbers were ready was a mistake; losing the chance of a great strategic surprise, and owing also to tactical mishandling and minor technical defects they only had a limited success. Although the higher military authorities lost faith in them, and some urged their abandonment, more discerning eyes realised that here was a key which, when properly used, would unlock the trench barrier. The Somme offensive had a further indirect effect, for its relief to the Verdun pressure enabled the French to prepare counter-strokes, on Oct. 24 and Dec. 15, which regained most of the lost ground with small casualties. These economic successes were due to a more elastic use of the limited objective method, and to a high concentration of artillery, with a minimum of infantry, to occupy the defences crushed by the guns.

*The Conquest of Rumania.*—Rumania, sympathetic to the Entente cause, had been waiting a favourable opportunity to enter the War on their side, and Brusilov's success encouraged her to take the plunge. Her command hoped that this, combined with the Allied pressure on the Somme and at Salonika, would fix the German reserves. But Rumania's situation had many inherent defects. The strategical position of her territory was bad, forming an "L" reversed, with the bottom section sandwiched between Hungary and Bulgaria. Her army, though externally on a modern pattern, had grave weaknesses beneath the surface. Of her allies, only Russia could give her direct aid, and they failed her. And, with all these handicaps, she launched an offensive into Transylvania, which bared her flank to Bulgaria. The Rumanian forces advanced west in three columns, leaving only three divisions to watch the Danube frontier facing Bulgaria.

While the Entente fumbled the Germans acted. The plan was initiated by Falkenhayn and developed by Hindenburg-Ludendorff when they took over the supreme command on Aug. 28. While one force concentrated in Transylvania for a counter-stroke, a Bulgarian Army with German stiffening—under Mackensen—was to strike through Rumania's "back-door" and invade the Dobruja. On Sept. 5 Mackensen forced the Danube crossing at Turtucaia, destroyed three Rumanian divisions and made good his hold on the Dobruja. This automatically halted the Rumanian offensive in Transylvania, and drew away its reserves; at the end of Sept. they were thrown back by the Austro-German counter-offensive, of which Falkenhayn was given executive command. They succeeded in holding the passes of Rumania's mountain border in the west until mid-Nov., but Falkenhayn just broke through before the snows blocked the passes. Mackensen had switched his main forces westwards, and on Nov. 23 crossed the Danube close to Bucharest, on which both armies now converged. It fell on Dec. 6, and, despite belated Russian aid, the Rumanian forces were driven north into the upper section of the Rumanian "L". The brilliantly co-ordinated German strategy crippled their new foe, gained possession of the bulk of Rumania, with its oil and wheat, and gave the Russians another 300 m. of front to hold. Sarrail, at Salonika, had not succeeded in fixing the Bulgarian reserves.

*The Capture of Baghdad.*—The only territorial success that the Entente could show for their year's campaign was away in Mesopotamia—the capture of Baghdad, and this moral token was seized on with an enthusiasm which, militarily, it hardly warranted. The bitter experience of the past had damped the ardour of the British Govt., and Sir William Robertson, the new Chief of the Imperial General Staff, was opposed to any further commitments which drained the strength available for the western front. But Maude, the new commander on the

spot, by subtle if unconscious steps succeeded in changing their defensive policy into one of a fresh offensive. After thorough reorganisation of the Mesopotamian force and its communications, he began on Dec. 12 1916 a progressive right wheel and extension of his front on the west bank of the Tigris, until by Feb. 22 he faced the main Turkish force across the Tigris above and below Kut. These methodical trench-warfare operations had placed him ready for a spring across the Tigris at the Turks' line of retreat, which was thus parallel to his front. But despite his four-to-one superiority of force, the failure of his right to fix the enemy and of his cavalry to cut off their retreat prevented a decisive success. But it led to permission for an advance on Baghdad, and he entered the Mesopotamian capital on March 11 1917. A series of skilfully conducted operations then drove the Turks into divergent lines of retreat and secured the British hold on the province.

*The Advance on Palestine.*—Ever since the abortive Turkish attempt to invade Egypt early in 1915, the British had kept large forces there, even when the Dardanelles expedition was crying out for troops. When Gallipoli was evacuated, the release of the Turkish forces threatened a fresh move on Egypt. To anticipate this by gaining command of the Sinai Desert, Sir Archibald Murray advanced in the spring of 1916, defeating the Turkish forces, freshly arrived, at Romani, Magdhaba and Rafa. The rate of advance was governed by the time taken in extending a railway and pipe-line (for water) across the desert. This new "Exodus" inspired the British Govt. to an invasion of Palestine, at as cheap a cost in troops as possible. The towns of Gaza, on the coast, and Beersheba, 25 m. inland, guarded the approach to Palestine. Murray attacked Gaza on March 26, but the attempt fell short when on the brink of success. A more deliberate attack on April 17-9 was a costlier failure against defences now strengthened.

*The War at Sea 1915-6.*—Germany's first submarine campaign—associated by allied opinion with the name of Admiral von Tirpitz, the exponent of ruthlessness—had been a signal failure, both in its meagre results and the disproportionate ethical damage it did to Germany's cause. A series of Notes exchanged between the American and German Govts. culminated in April 1916 in a virtual ultimatum from President Wilson, and Germany abandoned her unrestricted campaign. The deprivation of this weapon spurred the German Navy to its first, and last, attempt to carry out the initial plan on which it had begun the War. On May 30 1916 the British Grand Fleet left its bases on one of its periodical sweeps through the North Sea, but with reason to expect a possible encounter. On May 31, early in the morning, the German High Sea Fleet also put to sea, in the hope of destroying some isolated portion of the British fleet.

For such an encounter the British Admiral, Jellicoe, had formulated an outline plan in the early months of the War. Its basis was the cardinal necessity of maintaining the unimpaired supremacy of the Grand Fleet, which he viewed as an instrument not merely of battle but of grand strategy, the pivot of the Allies' action in all spheres, economic, moral and military. Hence while desirous of bringing to battle under his own conditions he was determined not to be lured into mine and submarine infested waters.

Early in the afternoon of May 31, Beatty, with his battle-cruisers and a squadron of battleships, after a sweep to the south was turning north to rejoin Jellicoe, when he sighted the German battle-cruisers, five in number. In the initial engagement two of Beatty's six battle-cruisers were hit in vital parts, and when thus weakened he came upon the main German fleet under Von Scheer. He turned north to lure them into reach of Jellicoe, 50 m. distant, who raced to support him. To describe the intricate and much debated manoeuvres which followed is neither possible nor would it be just within the limits of this article, a strategical and not a tactical survey. Mist and failing light put an end to an indecisive action, which, however, left the British fleet between the German and its bases. During the night Von Scheer slipped past their guard, which Jellicoe dared not draw

too close in view of his guiding principle and the danger of torpedo attack.

But if the battle of Jutland could be counted a tactical advantage to the Germans, it had no effect on their strategic position. Britain's command of the sea was intact, and the grip of the blockade on Germany unrelaxed. Once more she fell back on submarine warfare, and the first development was an extension of range. In July one of her new large submarine-cruisers appeared off the American coast and sank several neutral ships. In British and Mediterranean waters the pressure began seriously to affect the sea-borne trade and food supplies of the Entente. Various remedies were tried—the most effective being a system of sailing in convoys—but the only truly adequate measure, that of penning the Germans in their bases by close-in minefields, was debarred by Britain's failure to obtain a decisive battle success. But if Britain was feeling the strain of economic pressure, so also was Germany, and her leaders feared that the race between decisive success on land and economic collapse would end against her. The naval authorities declared that a renewal of the "unlimited" submarine campaign, which with her increased numbers could now be far more intense, would bring the Entente to their knees. Accepting this opinion, Ludendorff consented to a step which he had hitherto opposed, and on Feb. 1 1917 it was inaugurated—with the full realisation that it involved the weight of America being thrown into the scales against them.

## V. THE PENULTIMATE YEAR

Despite incessant provocation for two years, since the "Lusitania" incident, President Wilson had held to his neutral policy, and if his excess of patience angered many of his own people it at least was the means of consolidating American opinion and reconciling it as a whole to intervention in the War. Meantime he strove by speech and by the agency of Colonel House, his unofficial ambassador—to find a basis of peace on which the belligerents could agree. This effort was doomed to failure by its misunderstanding of the psychology of the warring peoples and of the fundamental objects for which they were fighting. He was still thinking in terms of traditional warfare, between governmental policies, while the conflict had long since passed into the wider sphere of the struggle of peoples dominated by the primitive instinct of self-preservation.

The declaration of the unlimited submarine campaign brought convincing proof of the futility of these peace hopes and of the reality of the German intentions, and when followed by the deliberate sinking of American ships and an attempt to instigate Mexico to action against the United States, President Wilson hesitated no longer, and on April 6 1917 America entered the War against Germany.

Her potential force in man-power and material was illimitable, but, even more urgently than Britain in 1914, it must be long in exerting more than a moral influence, and Germany confidently anticipated that the submarine campaign would take decisive effect within a few months. How near her calculation came to fulfilment the record of 1917 and 1918 bears witness.

*The Western Front Campaign of 1917.*—The year 1916 closed in gloom for the Entente. The simultaneous offensive on all fronts, planned a year before, had misfired, the French Army was at a low ebb, the Russian still lower, the Somme had failed to produce visible results in any way proportional to its cost, and another fresh Ally had been overrun. At sea the negativeness of Jutland was a disappointment, and although Germany's first submarine campaign had been abandoned a stronger one was threatened. To offset these debits, the Entente could only show the capture of distant Baghdad and a limited Italian success on the Isonzo in Aug., which had gained the important position of Gorizia. Its value, however, was mainly as a moral tonic to Italy herself.

The Entente plan for 1917 was complicated by changes in the command. French opinion had tired of the meagre results of Joffre's attrition strategy, and the method of the limited offensive had fallen into disfavour because of the unlimited losses,

on the wrong side, which accompanied it without apparent gain. They contrasted the dull course of his strategy with the brilliant results gained by Mangin at Verdun, in the autumn, under Nivelle's direction, and as a result Joffre gave place to Nivelle, who promised a real breakthrough. His confidence so inspired Mr. Lloyd George, the new British Prime Minister, that Haig was subordinated to him for the forthcoming operations—an arrangement which violated the axiom that a general cannot direct one force while exercising executive command of another. For carrying out a plan essentially audacious, Nivelle had two further handicaps; he failed to convert several of his subordinates to the idea, and he was given less rein by the Government than his predecessor. Again, while Joffre had intimated that the British must take the chief part, Nivelle changed this policy, and in his desire to conserve the glory for France overlooked how severely the French fighting power had been strained. Joffre's plan had been for a convergent attack on the great German salient Lens-Noyon-Reims, first against its west flank and then against its south—the British to attack north of the Somme, including but extending beyond the old battle ground, and the French south of it to the Oise. The attacks were to begin early in Feb. and to be followed by a French main attack in Champagne. Nivelle's change was to ask the British to take over more of the front in order to release French troops for the Champagne blow, and as a result the start was postponed a month.

Before it could begin the Germans had dislocated it. Ludendorff's first step had been to set on foot a complete programme for the reorganisation and expansion of German man-power, munitions and supplies. While this was developing, he intended to stand on the defensive, hoping that the new submarine campaign would either decide the issue or pave the way for a decisive blow on land when his new reserves of men and material were ready. Anticipating the renewal of the Entente advance on the Somme, he had a new line of defence, of great artificial strength, built across the chord of the arc Lens-Noyon-Reims. Then after devastating the whole area inside the arc, he began a methodical retirement, by stages, to the new line called by the Germans the "Siegfried" and by the Allies the "Hindenburg" line. A consummate manoeuvre, if brutal in application, it showed that Ludendorff had the moral courage to give up territory if circumstances advised it. The British, confronted with a desert, were inevitably slow in pursuit, and their preparations for an attack on this front were thrown out of gear, limiting them to the sector around Arras, where the front was unchanged.

On April 9 Allenby's III. Army opened the spring offensive at this point, but failed to develop its initial success, and continued the attack too long after the resistance had hardened. This costly action was partly to take the pressure off the French. The French blow south of the Somme was stultified by the German retirement, and the main attack was a worse fiasco. With a prolonged bombardment giving away any chance of surprise, and without first drawing away the German reserves, the idea of a rapid breakthrough was doomed to fail. Nivelle was replaced by Pétain, whose first concern was to restore the shaken morale of the French troops, and for the rest of the year the British bore the brunt of the campaign. The strain was increased by the failure of Russia to make any effective contribution to the pressure on Germany owing to the revolution which broke out in March. Haig decided to keep the Germans occupied by carrying out the original plan for an offensive in Belgium, and if the principle was right the method and choice of site were open to criticism.

The initial move was an attack on the Messines ridge in order to straighten out the Ypres salient and attract the enemy's reserves. Carried out by the II. Army under Plumer, with Harington as chief of staff, it proved a model example of the "limited" attack, with success economically gained by able staff-work and co-operation between the arms.

It was followed on July 31 by the main attack at Ypres which, hampered by the heavy rain, was foredoomed by its own destruction of the intricate drainage system of the area. The British com-

mand had persevered for 2½ years with the method of a prolonged preparatory bombardment, believing that quantity of shells was the key to success, and that unlike all the great captains of history they could disregard the element of surprise. The offensive at Ypres, which was finally submerged in the swamps of Passchendaele in Oct., threw into stronger relief than ever before the fact that such a bombardment blocked the advance for which it was intended to pave the way—because it made the ground impassable. The discomfiture was increased by the new German method of defence, which Ludendorff introduced, of thinning the front defences and using the men so saved for prompt local counter-attacks. The defence was built up of a framework of machine-guns distributed in concrete "pill-boxes" and disposed in great depth. On the British side the profitless toll of this struggle in the mud was to some extent mitigated by better staff work, when the direction of the attack was handed over to Plumer's II. Army.

Three months of dreadful struggle came to an end with the British not appreciably nearer their object of driving the Germans from their submarine bases in the Belgian ports, and if they had worn down the German strength they had worn down their own still more.

*The Renaissance of Surprise at Cambrai.*—The 1917 campaign in the west closed, however, on a note brighter in promise if not in accomplishment. Appreciating from the first days the futility of using tanks in these Flanders swamps, the Tank Corps headquarters looked around for an area where they could try out a new and different method. The chief general staff officer, Colonel Fuller, drew up a project for a large scale raid to scour a canal-enclosed "pocket" near Cambrai, where the rolling downland lent itself to tank movement. The basic idea was the release of a swarm of tanks without any preparatory bombardment to give warning of the attack. When their hopes at Ypres waned, the British command adopted the scheme, retaining the basic idea, but transforming the operation into a definite offensive with far-reaching aims, for which they had not the resources because of the drain of Ypres. The operation was to be carried out by Byng's III. Army with six divisions, and the date was fixed for Nov. 20. Led by nearly 400 tanks, the attack came as a complete surprise, and despite minor checks achieved a penetration far deeper and at less cost than any past British offensive. But all the available troops and tanks were thrown into the first blow, and the higher command failed to give Byng the few reserves they possessed in time to exploit the success. The cavalry, as always on the western front, proved unable to carry out this rôle.

Thus the advance died away, and on Nov. 30 the German Army commander, Von der Marwitz, launched a convergent counter-stroke against two flanks of the salient created by the British progress. In the north it was parried but in the south broke through and a disaster was only averted by the superb counter-attack, first of the Guards division and later of a tank brigade. But if Cambrai was a disappointment it revealed that surprise and the tank were the combination by which the trench-barrier could be unlocked. Meanwhile Pétain, after overhauling his instrument, the French Army, sought to test its readiness for 1918. In Aug. a stroke by Guillaumat's army recovered all the remainder of the ground lost in 1916, and in Oct. Maistre's army flattened the southwest corner of the German front, seizing the Chemin des Dames ridge.

*The Collapse of Russia.*—The temporary breakdown of the French fighting power was not the worst of the troubles which together crippled the Entente offensive in 1917. The collapse, first partial and then complete, of Russia was a loss which even the entry of America into the War could not possibly compensate for many months, and before the balance was restored the western Allies were to be perilously near the brink of defeat. Russia's enormous losses, due to her own defective machine but incurred in sacrifice for her Allies, had undermined the moral even more than the material endurance of her forces. Revolution broke out in March, superficially against the corrupt *entourage* of the Tsar, but with more deep-seated moral causes

beneath. The Tsar was forced to abdicate and a moderate Provisional Govt. climbed into the saddle, but without reins. This was only a makeshift, and in May another succeeded it, more Socialist in tendency and outwardly led by Kerensky. While clamouring for a general peace and undermining discipline by a system of committee control suitable to a trade union but not to the field of battle, Kerensky imagined he could send troops against the enemy by platform appeals. Brusilov succeeded Alexeiev in the supreme command, and on July 1 the army gained some initial success against the Austrians, only to stop as soon as real resistance was met, and to crumble directly the Germans counter-attacked. In Sept. the Germans took the opportunity to practise their new method of attack intended for use in France and captured Riga, but next month the Bolsheviks under Lenin overthrew the wordy Kerensky, imposed their self-constituted rule on the Russian people and sought an armistice with Germany, which was concluded in December.

*Italy's Caporetto Disaster.*—The defection of Russia did not end the Entente tale of woe. Each autumn with demoralising regularity Germany had seized an opportunity to eat up one of the weaker Allies. In 1915 it had been Serbia's fate, in 1916 Rumania's and now it was Italy's turn, or so the Germans intended. Ludendorff's decision, taken in Sept., was determined by the appeals of the Austrian authorities, who felt that their troops could not endure the strain of another defensive battle on the Italian frontier—they had lost ground in Aug. in face of the Italians' eleventh offensive on the Isonzo. Ludendorff had a difficult problem to solve. Russia had not yet capitulated, the front there was already weakly held for its extent, and the British offensive in Flanders made impossible a large withdrawal of troops from France. As he could only scrape together seven German divisions, and the Austrians' quality was lower than ever, he came to the conclusion that the only chance of decisive results was to pick out a particularly weak point which at the same time offered scope for a strategic exploitation of the breakthrough. He found this in the Caporetto sector of the Italian front.

The Italian frontier province of Venezia (Venice) formed a salient pointing to Austria and flanked on the north by the Austrian Trentino, on the south by the Adriatic. Bordering on the Adriatic is a stretch of relatively low ground on the Isonzo front, but the frontier then follows the Julian and Carnic Alps in a wide sweep round to the northwest. The seven German divisions with nine Austrian formed the XIV. German Army under Otto von Below, and were to climb the southern end of the mountain barrier, while Boroevic's two Austrian armies were to join in the advance along the Adriatic shore. The organisation and deployment of the attack in such mountainous country was difficult, but on Oct. 24, after a short bombardment, the blow was launched and pushed deep down the western slopes of the mountains, imperilling the Italian forces to both south and north. On Oct. 28 Von Below's van reached Udine, the former Italian General Headquarters, and on Oct. 31 the Tagliamento.

While the Austrian command issued the orders, Ludendorff pulled the strings which set them in motion. And not the least significant feature of this offensive was the way it was prepared not by an artillery but by a moral bombardment. Propaganda had been exploited for months as a means of sapping the Italian discipline and will to resist. Cadorna, the Italian commander, had failed alike to counteract this demoralisation of the army and to guard against the military attack of which he had ample warning.

But its effect seems also to have surprised Ludendorff, who with his slender forces had not calculated on such distant objectives as were now possible of attainment. Boroevic was slow in following up the Italian right, and Ludendorff tried to switch part of his force to Conrad's army which flanked the north of the Venezia salient, but was foiled by the inadequacy of the rail communications. Even so, Cadorna, with his centre broken through, only saved his wings by a precipitate retreat to the line of the Piave, covering Venice, and on Nov. 9 the whole Italian

Army was behind this river except for 250,000 prisoners in the enemy's hands, and twice as many other casualties—killed, missing or sick. The same day Cadorna was superseded in supreme command by Diaz. Italy's allies had begun to rush reinforcements to her aid, a British and French army corps, and on Nov. 5 their political and military chiefs arrived at Rapallo for a conference, out of which sprang the Allied council at Versailles, and ultimately a unified command.

The invaders had outrun their transport and the resistance of the Italians, morally braced by the emergency, succeeded in holding the Piave in face of direct assaults and strenuous efforts by Conrad to turn their left flank from the Trentino. At the beginning of Dec. the British and French, who had been waiting in reserve in case of a fresh breakthrough, moved forward to take off vulnerable sectors, but the attack was only renewed in the north and on Dec. 19 it came to an end with the snows. If Caporetto seriously damaged Italy, it also purged her, and after an interval of recuperation she was to vindicate herself at Vittorio Veneto.

*The Capture of Jerusalem.*—Once more a distant theatre of war provided the sole triumph of the Entente cause during the year—this time in Palestine. The second reverse at Gaza in April 1917 led to a change in command, Murray being succeeded by Allenby, who was strong enough and fortunate enough to obtain the adequate force for which Murray had asked in vain. The British Govt. was anxious for a spectacular success to offset the moral depression of the Nivelle failure and the decline of Russia, and the British General Staff desired to dislocate the Turkish attempt to recapture Baghdad by drawing away their reserves.

Allenby took over in July and devoted the first three months to intensive preparations for an autumn offensive, when the season would be suitable. The command was reorganised, the communications developed, and his own headquarters moved forward from Cairo to the front. By complete secrecy and ruses he deceived the Turks as to the main point of attack. The defences of Gaza were bombarded from Oct. 20 onwards, and an attack followed on Nov. 1 to pin the enemy and draw in his reserves. Meanwhile, as a necessary preliminary to the real blow, the inland bastion of Beersheba was seized by a convergent manoeuvre on Oct. 31, a prelude to the decisive attack on Nov. 6, which broke through the enemy's weakened centre and into the plain of Philistia. Falkenhayn, now in command at Aleppo, had also been planning an offensive, but the better communications of the British had decided the race, and although Falkenhayn tried to stem the tide by a counter-stroke against Beersheba, the breaking of his centre compelled a general retreat. The pursuit was hampered owing to lack of water, but even so by Nov. 14 the Turkish forces were driven apart in two divergent groups, the port of Jaffa was taken, and Allenby wheeled his main force to the right for an advance inland on Jerusalem. He gained the narrow hill passes before the Turks could block them, and after a necessary pause to improve his communications brought up reserves for a fresh advance, which secured Jerusalem on Dec. 9. By the time the winter rains set in the British had expanded and consolidated their hold on the region. As a moral success the feat was valuable, and one immediate result was a revolt in Arabia against the Turks.

Yet, viewed strategically, it seemed a long way round to the goal. If Turkey be pictured as a bent old man, the British, after missing their blow at his head—Constantinople—and omitting to strike at his heart—Alexandretta—had now resigned themselves to swallowing him from the feet upwards, like a python dragging its endless length across the desert.

*The Conquest of East Africa.*—The year 1917 witnessed another overseas success, the clearing of German East Africa, although not the close of the campaign. More than a year elapsed after the rebuff at Tanga before a serious attempt was made to subdue their last German stronghold on the African continent. To spare troops from the main theatres was difficult, and the solution was only made possible by the loyal co-operation of the South African Government. In Feb. 1916 Gen. Smuts was

appointed to command the expedition and formed the plan of a drive from north to south through the difficult interior, in order to avoid the fever-rampant plain on the coast. In conjunction with this central wedge a Belgian force under Tombeur was to advance eastwards from Lake Tanganyika, and a small British force under Northey was to strike in from Nyasaland in the southwest. The Germans under Lettow-Vorbeck were weak in numbers but handled with masterly skill, and with all the advantages of an equatorial climate, a vast and trackless region—mountainous in parts and covered with dense bush and forest—to assist them in impeding the invader. From Dar-es Salaam on the coast to Ujiji on Lake Tanganyika ran the one real line of rail communication, across the centre of the colony. After driving the Germans back across the frontier and seizing the Kilimanjaro gap, Smuts moved direct on this railway at Morogoro, over 300 m. distant, while he dispatched a force under van Deventer in a wide sweep to the west to cut the railway further inland and then converge on Morogoro. Lettow-Vorbeck delayed this manoeuvre by a concentration against van Deventer, but Smuts' direct advance compelled him to hurry his force back, and thus enabled van Deventer to get astride the railway.

However, Lettow-Vorbeck evaded the attempt to cut him off and fell back in Sept. on the Uluguru mountains to the south. The Belgians and Northey had cleared the west and the net had been drawn steadily closer, confining Lettow-Vorbeck to the southeast quarter of the colony. Early in 1917 Smuts returned to England and van Deventer conducted the final operations which ended with Lettow-Vorbeck, avoiding envelopment to the end, slipping across the frontier into Portuguese Africa. Here he maintained a guerilla campaign throughout 1918 until the general Armistice. With an original force of only 5,000, 5% being Europeans, he had caused the employment of 130,000 enemy troops and the expenditure of £72,000,000.

*The Mastering of the Submarine.*—The military side of 1917 is thrown into shadow by the naval, or more strictly the economic, side. The vital issue turned on the balance between Germany's submarine pressure and Britain's resistance. April was perhaps the most critical month. The Allies lost nearly a million tons of shipping, 60% British, and although the German Navy's promise of victory by the end of the month was proved a miscalculation, it was clear that ultimately the continuance of such a ratio of loss must starve the civilian population and automatically prevent the maintenance of the armies. Britain, indeed, had only food enough to sustain her people for another six weeks. The British Govt. sought to counter the menace by the indirect means of rationing, increasing home production and the expansion of shipbuilding; by the direct means of the system of convoys with naval escorts, and a counter-offensive against the submarine. Aided by new devices to detect the presence of submarines and the use of thousands of patrol craft this highly organised campaign exacted an ever-rising toll, and by the end of 1917 the menace, if not broken, was at least subdued. In this task America's aid became a potent factor long before her military assistance. It embraced her provision of light craft to reinforce the British anti-submarine fleet, her rapidly developed construction of new mercantile ships and still more her financial aid. By July 1917 Britain had spent over £5,000,000,000, her daily expenditure had risen to £7,000,000, and the burden of financing her Allies as well as her own efforts was straining even her resources, when America's aid came to ease the pressure.

These were the defensive benefits; the offensive were at least as great. No longer was the grip of the naval blockade hampered by neutral quibbles, but instead America's co-operation converted it into a strangle-hold under which the enemy must soon grow limp, since military power is based on economic endurance. As a party to the War, the United States, indeed, wielded the economic weapon with a determination, regardless of the remaining neutrals, far exceeding Britain's boldest claims in the past years of controversy over neutral rights. The submarine menace, crippled in 1917, was ended to all intents during the early months of 1918, largely through two positive achievements. The first

was the laying of a mine-barrage by the American Navy across the 250-mile wide passage between Norway and Scotland; the second, the daring attacks of Sir Roger Keyes' force on Zeebrugge and Ostend, which closed the Belgian coast as a base for the German submarines. Yet the removal of the menace should not lead to an underestimate of its powers for the future. The 1917 campaign was launched with only 148 submarines and from the most unfavourable strategic position. Great Britain lay like a huge breakwater across the sea approaches to northern Europe and the submarines had to get outside through narrow and closely watched outlets before they could operate against the arteries of supply. And despite these handicaps they almost stopped the beat of England's heart.

*The Air Offensive.*—Another new form of action reached its crest at the same time as the submarine campaign. As the submarine was primarily an economic weapon, so was the aeroplane primarily a psychological weapon. The explosive bullet had virtually ended the Zeppelin raids in 1916, but from early in 1917 aeroplane raids on London grew in intensity until by May 1918 the air defences were so thoroughly organised that the raiders thereafter abandoned London, as a target, for Paris. If the stoicism of the civil population took much of the sting from a weapon then in its infancy, the indirect effect was serious, interrupting business and checking output in industrial centres, as well as drawing off, for defence, many aircraft from the front. In reply the British formed an Independent Air Force, which carried out extensive raids into Germany during the closing months of the War, with marked effect on the declining morale of the "home front." To relate the action of aircraft in the military sphere is not possible, for it formed a thread running through and vitally influencing the whole course of operations, rather than a separate strategic feature.

The beginning of 1918 witnessed the development and thorough organisation of another psychological weapon, when Lord Northcliffe was appointed Director of Propaganda in Enemy Countries, and for the first time the full scope of such a weapon was understood and exploited.

## VI. THE ALLIED VICTORY

*On the Threshold of 1918.*—The middle years of the World War had been, in a military sense, a tussle between a lean Hercules and a bulky Cerberus. The Germanic alliance was weaker in numbers but directed by a single head, the Entente stronger in numbers but with too many heads. Owing to their own excessive losses, diffusion of effort and the collapse of Russia, the Entente at the end of 1917 were faced with the grim fact that the numerical balance had been reversed, and months must elapse before the prospective stream of America's new divisions came to tilt the scales once more in their favour. The emergency paved the way for the creation of a unified command but it still needed disaster to bring it into being.

At the conference at Rapallo in Nov. the formation of a Supreme War Council was decided upon, to be composed of the principal ministers of the Allies, with military representatives, and to sit permanently at Versailles. If the fundamental defect was that it merely substituted a formal for an informal committee, a further flaw was that the military representatives had no executive status. In the economic sphere, where deliberation rather than instant action was necessary, it led to a real improvement in the combination of shipping, food and munition resources. Militarily, it was futile, for it set up a dual advisorship—the Versailles representatives on the one hand and the chiefs of the national general staffs on the other. As the menace of the German attack grew closer and with it the need for common action, this advisory body was converted into a military executive committee to handle an inter-Allied general reserve, a fresh compromise which set up a dual control—the commanders-in-chief and the Versailles committee.

If concentration of control was lacking, so also was concentration of force. The political chiefs were slow to realise how grave was the danger. Since early in Nov. the stream of German troop-trains from east to west had been steadily swell-

ing. When the 1917 campaign opened there had been a proportion of nearly three allies to two Germans, but now the Germans had a slight balance and the likelihood of bringing still more. Yet with this knowledge the allied statesmen could not agree to draw reinforcements from the other fronts. Mr. Lloyd George went further and urged an offensive in Palestine, a scheme which was sanctioned on the understanding that no reinforcements went there from France, but which also meant that none came from there to France. Robertson, the Chief of the Imperial General Staff, disagreed both with this Palestine plan and the creation of the Versailles executive committee, and resigned, being succeeded by Sir Henry Wilson. The position was still further weakened by the insistence of M. Clemenceau, the new French premier, that the British should extend their front south to the Oise. This meant that Gough's V. Army was dangerously stretched out and took over ill-prepared defences on the very front that Ludendorff was about to strike.

Haig, rightly, and Pétain, wrongly, each expected the main German attack to fall on their respective fronts, and in view of this uncertainty the Supreme War Council decided to form a common reserve, which the new military executive committee under Foch should use wherever necessary. Foch called on Haig to contribute seven of the thirty divisions, and when the British commander replied that he could spare no troops the scheme broke down a week before the German blow fell.

On the German side the submarine panacea for victory had been replaced by a military panacea, and hopes were perhaps exaggerated by the unexpected collapse of Russia. But although Ludendorff promised victory in the field, he did not disguise that a western offensive would be a far harder task than the conquests in the east. He realised also that it would be a race between the effect of Germany's blow and the arrival of American reinforcements, although he hoped to win the race. To secure the rear of his offensive, a definite peace was won from the Bolshevik Govt. of Russia by a military demonstration, and also forced on Rumania. And to secure if possible the economic base of his offensive the Ukraine was occupied, for its wheat supplies, with little resistance except from Czechoslovak troops, who had formerly been taken prisoners from the Austrian Army.

*The German Offensive.*—Ludendorff's next problem was to decide his first point of attack. The sector between Arras and St. Quentin was chosen, on the western face of the great salient formed by the German front in France. The choice was governed by tactical reasons—this sector was the enemy's weakest point and the ground offered fewer difficulties than elsewhere—although Ludendorff had in mind the possibility of separating the Allied Armies and driving the British back against the Channel coast, too closely penned in to evade the blows. The tactical bias was, however, to have vital results, leading the Germans to change direction and dissipate their strength owing to their principle of taking the line of least resistance. If the Franco-British command had erred hitherto by aiming at the strategically correct target without enough attention to the tactical difficulties, the German command was now to concentrate on tactical success at the expense of the strategic goal. Ludendorff's strategy in the East had been so masterly and so far-sighted that the change is difficult to explain. From the experience of the vain allied attacks he had drawn the deduction that "Tactics had to be considered before purely strategical objects which it is futile to pursue unless tactical success is possible." Presumably he hoped by firm control to guide these tactical movements to a strategic destination. If so, he failed. Perhaps he himself was feeling the strain of directing so many vast operations; in any case the campaign leaves the impression that Ludendorff had neither his former clearness as to the goal, nor quite the same grip on the changing situations. But in the organisation of his attacks his powers were at their highest level. The troops were trained in the new infiltration tactics already tested at Riga, and the most thorough arrangements were made for concealing and for exploiting the attacks (*see TACTICS*). The assaulting divisions were to be brought up over night, the masses of artillery brought close to the front line in concealment, and their ranges obtained

by methods which did away with preliminary "registration." The bombardment was to be brief but intense and its surprise effect to be increased by lavish use of gas and smoke shell. Further, while Ludendorff had settled to strike first on the Somme sector, to which blow the code-name "Michael" was given, he also made preparations for successive attacks at other points, which besides being in readiness for the future helped to mystify the enemy. Two were on the British front and one on the French—"St. George I." against the Lys sector, "St. George II." against the Ypres sector and "Blücher" in Champagne.

The "Michael" attack was to be made by the German XVII., II. and XVIII. armies on the 47-mile front Arras-St. Quentin-La Fère, but its main force was intended to be exerted north of the Somme, and after breaking through, the XVII. and II. armies were to wheel northwest and press the British Army against the coast, while the river and the XVIII. Army guarded their flank. The attack was launched on March 21, and while it broke through completely south of the Somme, where the defence was thinnest, it was held up near Arras, a check which reacted on all the attack north of the river. As a result, on March 23 Ludendorff abandoned his original idea, and directed his main effort towards Amiens. By March 27 the advance had penetrated nearly 40 m. and reached Montdidier, cutting one railway to Paris; by March 30 the German flood was almost lapping the outworks of Amiens. But their route had led them across the desert of the old Somme battlefields, a brake on communications and supply, and to an area where the French could most easily support their hard-pressed allies.

This support was certainly slow to arrive, for Pétain still expected the main blow on his own front, but disaster drove the Allies to an overdue step, and largely through Lord Milner's intervention Foch was appointed on March 26 to "co-ordinate" the operations of the Allied armies. Once before, in the crisis at Ypres in 1914, he had filled such a rôle, on a smaller scale, and his will-power and energy had helped to buttress the resistance. And if since then he had fallen into disfavour owing to the heavy cost of his attacks in Artois during 1915 and the barren fruit of the Somme in 1916, he was later to show that he had turned the experience to profit, and to justify in practice his unique reputation as a theorist. On April 14 he was definitely made commander-in-chief of the Allied armies. Foch was stimulating the flow of reserves to cement the already hardening resistance, when he was interrupted by a fresh menace.

On March 28 Ludendorff had launched the XVII. Army to a fresh effort, this time to secure the heights near Arras, in order to pave the way for his "St. George I." attack on the Lys. The blow was repulsed by Byng's III. Army and inevitably affected Ludendorff's designs. Nevertheless, on April 9 he launched his "St. George I." attack, and its astonishing early success against a weakened front led him to convert it into a major effort. The British were desperately close to the sea, but their resistance stopped the German tide just short of the important railway junction of Hazebrouck, and an attempt to widen the front towards Ypres was nullified by Haig's swinging his line back just before and by the gradual arrival of French reinforcements.

Thus Ludendorff had fallen short of strategic results; on the other hand he could claim huge tactical successes—the British casualties were over 250,000. The British lion had been badly mauled, and although fresh drafts were hurried out from England and divisions brought back from Italy, Salonika and Palestine, months must elapse before it could recover its offensive power. Ten British divisions had to be broken up, reducing the Allied strength to 158 divisions against 208 German with 80 still in reserve. A restoration of the balance, however, was now in sight. A dozen American divisions had arrived in France and, responding to the call, great efforts were being made to swell the stream. Further, Pershing, the American commander, had placed his troops at Foch's disposal for use wherever required. For Germany the sands were running out, and, realising this, Ludendorff launched his "Blücher" attack between Soissons and Reims, on May 27. Falling by surprise with 40 divisions against seven, on a 30-mile front, it swept over the Aisne and

reached the Marne on May 30, where its impetus died away. Blocked frontally by the river, an attempt was made to push west, but it failed in face of Allied resistance—notable for the appearance of American divisions at Château-Thierry, where they gallantly counter-attacked.

Ludendorff had now created two huge bulges, and another smaller one, in the Allied front. His next attempt was to pinch out the Compiègne "tongue" which lay between the Amiens and Marne bulges. But this time there was no surprise, and the blow on the west of the "tongue," June 9, was too late to coincide with the pressure on the east. A month's pause followed. Ludendorff was anxious to strike his long-cherished decisive blow against the British in Belgium, but he considered that their reserves here were still too strong, and so again decided to take the line of least tactical resistance, hoping that a heavy blow in the south would draw off the British reserves. He had failed to punch out the Compiègne "tongue" on the west of his Marne salient; he was now about to attempt the same method on the east, by attacking on either side of Reims. But he needed an interval for rest and preparation, and the delay was fatal, giving the British and French time to recuperate, and the Americans to gather strength. The tactical success of his own blows had been his undoing; yielding to their influence, he had pressed each too far and too long, so using up his own reserves and causing an undue interval between each blow. He had driven in three great wedges, but none had penetrated far enough to sever a vital artery, and this strategic failure left the Germans with an intended front which invited flanking counter-strokes.

*The Turning of the Tide.*—On July 15 Ludendorff launched his new attack, but its coming was no secret. East of Reims it was foiled by an elastic defence, and west of Reims the German penetration across the Marne merely enmeshed them more deeply to their downfall—for on July 18 Foch launched a long-prepared counter-stroke on the other flank of the Marne salient. Here Foch turned the key which Ludendorff lacked, using masses of light tanks to lead a surprise attack on the Cambrai principle. The Germans managed to hold the gates of the salient open long enough to draw their forces back into safety and straighten their line. But their reserves were depleted, Ludendorff was forced to postpone the offensive in Belgium and the initiative definitely and finally passed to the Allies. Foch's first concern was to keep it, by giving the enemy no rest while his own reserves were accumulating. To this end he arranged with Haig, Pétain and Pershing for a series of local offensives, aimed to free the lateral railway communications and to improve the position of the front ready for further operations. But already before the Marne counter-stroke, Rawlinson, commanding the British IV. Army in front of Amiens, had submitted to Haig a plan for a large surprise attack there, and Foch agreed to this in place of his own idea for an attack on the Lys front. He also placed under Haig the French I. Army (Debeney) to extend the attack to the south. Rawlinson's army was doubled, and by skilful precautions the enemy were kept in the dark until, on Aug. 8, the attack was delivered—led by 450 tanks. Great as a material success, it was still greater as a moral.

Ludendorff says: "Aug. 8 was the black day of the German Army in the history of the War. . . . It put the decline of our fighting power beyond all doubt. . . . The War must be ended." He informed the Emperor and the political chiefs that peace negotiations ought to be opened before the situation became worse, as it must. On Aug. 10 Foch issued a fresh *directive* for the preparation of an "advance" by the British III. Army "in the general direction of Bapaume and Péronne." And as the momentum of the IV. Army was waning, the III. Army moved. From then on Foch beat a tattoo on the German front, a series of rapid blows at different points, each broken off as soon as its initial impetus waned, each so aimed as to pave the way for the next, and all close enough in time and space to react on each other. Thus Ludendorff's power of switching reserves to threatened spots was stopped, as his balance of reserves was drained.

On Aug. 10 the French III. Army had struck to the south; then on Aug. 17 the French X. Army still further south; next on

Aug. 21 the British III. Army, followed by the British I. Army on Aug. 26. Ludendorff's order to the troops holding the Lys salient to retire was hastened in execution by the attacks of the reformed British V. Army, and by the first week in Sept. the Germans were back on their original starting line—the strong defences of the Hindenburg Line. And on Sept. 21 Pershing completed the series of preliminary operations by erasing the St. Mihiel salient—the first feat of the Americans as an independent army.

The clear evidence of the Germans' decline and Haig's assurance that he would break the Hindenburg Line where the German reserves were thickest, decided Foch to seek victory that autumn instead of postponing the attempt until 1919. All the Allied armies in the west were to combine in a simultaneous offensive.

*The Collapse of Bulgaria.*—But before it could develop an event occurred in the Balkans which, in the words of Ludendorff, "sealed the fate of the Quadruple Alliance." He had still hoped to hold fast in his strong lines in the west, and with his strategic flanks in Macedonia and Italy covered, while the German Govt. was negotiating for a favourable peace. At the same time there was alarm as to the moral effect of the western front defeats on the German people, their will-power already undermined by shortage of food, and perhaps also by propaganda.

But on Sept. 15 the Allied armies in Salonika attacked the Bulgarian front, which crumbled in a few days. Guillaumat, who had succeeded Sarraill in Dec. 1917, had prepared the plan for an offensive, and when recalled to France in the crisis of July as Governor of Paris he won over the Allied governments to consent to the attempt. His successor in Salonika, Franchet d'Esperey, concentrated a Franco-Serb striking force, under Michich, on the Sokol-Dobropolye sector, west of the Vardar, where the Bulgarians trusted to the strength of the mountain ridges and were weak in numbers. On Sept. 15 Michich attacked and, while the British attack at Doiran pinned a large part of the Bulgarian reserves, he broke right through towards Uskub. With their army split into two parts the Bulgarians, already tired of the War, sought an armistice, which was signed on Sept. 29. Franchet d'Esperey's achievement not only knocked away the first prop of the Central Alliance but opened the way to an advance on Austria's rear.

*The Collapse of Turkey.*—The offensive planned for the spring in Palestine had been interrupted by the crisis in France and the consequent withdrawal of most of Allenby's British troops. The depletion was made up by reinforcements from India and Mesopotamia, and by Sept. Allenby was again ready to take the offensive. He secretly concentrated, on the Mediterranean flank, the mass of his infantry, and behind them the cavalry. In this way he changed a two- to one superiority on the general front into four to one at the decisive point. At dawn on Sept. 19 the western mass attacked, rolling the Turks back northeast towards the hilly interior—like a door on its hinges. Through the open doorway the cavalry passed, riding straight up the coastal corridor for 30 m., before swinging east to cut the Turkish communications and close all exits of retreat. Completely trapped, the main Turkish armies were rounded up, while the British cavalry exploited the victory of Megiddo by a swift and sustained pursuit which gained first Damascus and finally Aleppo. Defenceless and threatened with a direct advance of Milne from Macedonia on Constantinople, Turkey capitulated on Oct. 30.

*The First Peace Note.*—The capitulation of Bulgaria and, if to a less degree, the destruction of the Turkish armies, convinced Ludendorff that it was necessary to take a decisive step towards securing peace. While he was scraping together a paltry half dozen divisions to form a new front in Serbia, and arranging a meeting with the political chiefs, Foch's grand assaults fell on the Western defences, Sept. 26–28, and the line began to crack. On Sept. 29 Ludendorff told the Foreign Minister that an armistice must be asked for at once, and on Oct. 4 the German Govt. dispatched the first peace note to President Wilson. While they were debating the conditions for an armistice and

questioning Ludendorff as to the situation of the army for further resistance if the terms were unacceptable, Foch continued his military pressure.

*The Final Advance.*—The plan agreed upon between Foch and the Allied commanders was for a series of convergent and practically simultaneous attacks:—

1 and 2. By the Americans west of the Meuse, and by the French west of the Argonne, both in the direction of Mezières—beginning on Sept. 26;

3. By the British on the St. Quentin-Cambrai front in the general direction of Maubeuge—beginning on Sept. 27;

4. By the Belgian and Allied forces in the direction of Ghent—beginning on Sept. 28.

The general aspect was that of a pincer-like manoeuvre against the vast salient jutting out between Ypres and Verdun. The attack towards Mezières would shepherd that part of the German armies towards the difficult country of the Ardennes and away from their natural line of retreat through Lorraine; it was also dangerously close to the hinge of the Antwerp-Meuse line which the Germans were preparing in rear. The attack towards Maubeuge would threaten the other main line of communication and retreat through the Liège gap, but it had further to go. In these attacks, the Americans had the hardest natural obstacle, the Argonne Forest; the British had the strongest defences and the heaviest weight of enemy troops.

Pershing's attack, adding surprise to its four to one superiority in numbers, opened well, but lost impetus owing to the difficulties of supply and exploitation in such country. A new force, it was suffering the growing pains which the British had passed through in 1915–6.

Haig, by pushing forward his left wing first, facilitated the attack of his right on the strongest section of the Hindenburg Line—the Canal du Nord, and by Oct. 5 the British were through the German defence system, with open country beyond. But on this front the attackers were in actually inferior numbers to the defenders, their tanks were used up, and they could not press forward fast enough to endanger the German retreat.

Nevertheless the combined pressure of the Allied armies, and their steady advance, were loosening the will-power of the German Govt. and people. The conviction of ultimate defeat, slower to appeal to them than to the army chiefs, was the more forcible when it was realised. And the indirect moral effect of military and economic pressure was accentuated by the direct effect of peace propaganda, skilfully directed and intensively waged by Northcliffe. The "home front" began to crumble later but it crumbled quicker than the battle front.

*The Collapse of Austria.*—The last Austrian attempt at an offensive on the Italian front, in conjunction with the German assaults in France, had been repulsed on the Piave in June. Diaz waited until conditions were ripe for an offensive in return, until Austria's internal decay was spreading and she was without hope from Germany. On Oct. 24 Cavan's army moved to seize the crossings of the Piave and on Oct. 27 the main attack opened, driving towards Vittorio Veneto to divide the Austrians in the Adriatic plain from those in the mountains. By Oct. 30 the Austrian Army was split in two and the retreat became a rout, and the same day Austria asked for an armistice, which was signed on Nov. 4.

*The Curtain Falls on the Western Front.*—Already on Oct. 23 President Wilson had replied to the German requests by a note which virtually required an unconditional surrender. Ludendorff, who had wished to anticipate such terms by seeking peace before the situation had degenerated, now wished to carry on the struggle in hopes that a successful defence of the German frontier might damp the determination of the Allies. But the situation had passed beyond his control, the nation's will-power was broken, and his advice was in discredit. On Oct. 26 he resigned, and a few days later Germany became a republic in outward response to President Wilson's demand and in inward response to the uprising of the German people against the leaders who had led them into disaster. The German fleet had already mutinied when their commanders sought to send them out on a forlorn hope against the British.

On Nov. 6 the German delegates left Berlin to treat for an armistice. Their acceptance of the severe terms was hastened less by existing military events than by the imminence of a fresh blow. The Allied advance was still continuing, in some parts seeming to gather pace in the last days, but the main German forces had escaped from the perilous salient, and their complete destruction of roads and railways made it impossible for supplies to keep pace with the advancing troops. A pause must come while these communications were being repaired, and thus the Germans would have breathing space to rally their resistance. The advance reached the line Pont à Mousson-Sedan-Mezières-Mons-Ghent by Nov. 11—the line of the opening battles in 1914—but strategically it had come to a standstill.

To meet this situation Foch had concentrated a large Franco-American force, of 28 divisions and 600 tanks, to strike below Metz directly east into Lorraine. The general Allied advance had fixed the enemy's reserves, and now this decisive manoeuvre was to fall on his bared flank, turning the whole of his new line of defence along the Meuse to Antwerp. In addition Trenchard's Independent Air Force was about to bomb Berlin, on a scale hitherto unattempted in air warfare.

With revolution at home and this menace on their front, the German delegates had no option but to accept the drastic terms of the Armistice, which was signed in Foch's railway-carriage in the Forest of Compiègne on Nov. 11, and at 11 o'clock that morning the World War came to an end.

Controversy has long raged as to what was the deciding act of the conflict, what were the causes of victory, and, even less profitably, which country won the War. If it be accepted that the mind of the enemy's ruling power is the ultimate target, aimed at indirectly through the bodies of their troops and their civil foundations, then, so far as any military act was decisive, the memoirs of Ludendorff reveal that it was the attack of Aug. 8 reinforced by the overthrow of Bulgaria. But if these would have ensured peace it is most improbable that Germany would have accepted the conditions ultimately secured.

The truth is that no one act, still less one cause, was, or could be, decisive. The western front, the Balkan front, the tank, the blockade and propaganda have all been claimed as the cause of victory. All claims are justified, none is wholly right. In the new warfare between nations victory is a cumulative effect, to which all weapons—military, economic, and psychological—contribute. Victory comes, and can only come, through the utilisation and combination of all the resources existing in a modern nation, and the dividend of success depends on the way in which these manifold activities are co-ordinated. It is even more futile to ask which country won the War. France did not win the War, but unless she had held the fort while the forces of Britain were preparing and those of America still a dream the release of civilisation from this nightmare of militarism would have been impossible. Britain did not win the War, but without her command of the sea, her financial support and her army to take over the main burden of the struggle from 1916 onwards, defeat would have been inevitable. The United States did not win the War, but without their economic aid to ease the strain, without the arrival of their troops to relieve considerable parts of the Allied forces—freeing them for offensive use, and, above all, without the moral tonic which their coming gave, victory would have been impossible. And let us not forget how many times Russia had sacrificed herself to save her Allies; preparing the way for their ultimate victory as surely as for her downfall. Finally, however we may judge her motives, let us pay tribute to the incomparable endurance and skill with which Germany more than held her own for four years against superior numbers, an epic of military achievement.

The principles of war as disclosed and evolved in this period are described in the articles: WAR; STRATEGY; TACTICS; CAVALRY; ARTILLERY; INFANTRY.

The campaigns and battles have received separate and detailed treatment in articles such as the following: AIR WARFARE; ANTWERP, SIEGE OF 1914; ASIAGO, BATTLE OF 1916; BELGIUM, INVASION OF 1914; BREST-LITOVSK, BATTLES OF, 1915; CAMBRAI, BATTLE OF, 1917; CAMEROONS, OPERATIONS 1914-6; CAPORETTO, BATTLE OF;

CARPATHIANS, BATTLES OF THE; CAUCASUS, CAMPAIGNS IN THE; DARDANELLES CAMPAIGN; DUNAJECAN, BATTLES OF THE; EAST AFRICA, MILITARY OPERATIONS 1914-8; EASTERN EUROPEAN FRONT CAMPAIGNS 1914-8; FRONTIERS, BATTLES OF THE: 1. Early Operations in Upper Alsace, 2. First Battles in Lorraine, 3. Battle of the Ardennes, 4. Battles of Charleroi, Mons, le Cateau and Guise. ITALIAN CAMPAIGNS, 1915-8; JUTLAND, BATTLE OF; LEMBERG, BATTLES OF; LODZ-CRACOW, BATTLES OF 1914; LUCK (LUTSK) BATTLES OF, 1916; MARNE, BATTLE OF THE; MASURIAN LAKES, BATTLES OF THE; MESOPOTAMIA, OPERATIONS IN; NAREW, BATTLES OF THE, 1915; NAROCZ, BATTLE OF LAKE; WORLD WAR, NAVAL; PRZEMSL, SIEGES OF 1914-5; SALONIKA CAMPAIGNS; SERBIAN CAMPAIGNS, 1914-5; SOMME, BATTLE OF THE; VERDUN, BATTLES OF; VICTORY, ADVANCE TO; VISTULA-SAN, BATTLES OF THE; VITTORIO VENETO; WESTERN FRONT, 1914-8; YPRES, BATTLES OF: First Battle of, (1914) 2nd Battle of—Gas Attack; Third Battle of, (1917); YSER, BATTLE OF THE; ZEEBRUGGE, ATTACK ON.

The mechanism of war, the organisation of naval, military and air forces, and the scientific aspects of military machinery are dealt with in such articles as those on ADMIRALTY, BOARD OF; AIR FORCES; ARTILLERY (inc. Trench Ordnance); BALLISTICS; BOMBS; BRIDGING; MILITARY; CAMOUFLAGE, MILITARY; CAMOUFLAGE, NAVAL; CHEMICAL WARFARE; EXPLOSIVES, MILITARY; FLAME-THROWERS; INTELLIGENCE, NAVAL AND MILITARY; MINELAYING AND MINE-SWEEPING; MOTOR TRANSPORT, MILITARY; ORDNANCE; PARAVANE; RANGE-FINDERS AND POSITION FINDERS; RIFLES AND LIGHT MACHINE GUNS; SUPPLY AND TRANSPORT, MILITARY; TANKS.

(B. H. L. H.)

**WORLD WAR, NAVAL.**—It was on July 28 1914 that Austria issued her declaration of war on Serbia and the First Fleet received orders to proceed to Scapa Flow in the Orkneys. It left Portland at 7 A.M. on July 29. The bulk of the navy at this time was to be found in the Home Fleet, which was divided into three forces, representing three successive stages of efficiency. The First Fleet, which became the Grand Fleet, mustered all the latest ships, fully manned and in permanent commission. The Second Fleet consisted of older but still efficient battleships and cruisers, manned in peace time with nucleus crews amounting to two-fifths of their complements. Last of all came the Third Fleet, a motley collection of obsolescent ships in the basins of the naval ports.

The war organisation of these fleets is summarised in Tables I. and II., which show the strength of the forces ranged against one another in the North Sea. In terms both of ships and gun power the British Fleet was superior; 13 of its 19 dreadnoughts were armed with 13.5-in. guns, and the rest with 12-in., while the Germans had 12-in. guns in only nine of their ships and 11-in. in the remainder.

## I. THE OPENING OF HOSTILITIES

On July 29 "warning telegrams" went out to all squadrons abroad. On Aug. 1 the tension had increased and Germany issued the ominous order for *Kriegsgefahr* (precautionary period). Late that night the news came in that Germany had declared war on Russia, and at 1:25 A.M. on Aug. 2 Mr. Churchill issued the order to mobilise. By 4 A.M. on Aug. 3 the whole navy stood mobilised and ready for action. The German Fleet had returned hurriedly from a visit to Norway. On Aug. 1 the 2nd and 3rd squadrons came round from Kiel to the North Sea and at 8 P.M. that evening the order to mobilise went out in Germany. On the morning of Aug. 4 the Grand Fleet received orders to put to sea from Scapa. The term of Adml. Sir George Callaghan's command was nearly expired. It was thought that a younger commander was required to face the heavy strain of war, and the Grand Fleet (for it so was to be designated) put to sea at 8:30 A.M. under its new commander, Adml. Sir John Jellicoe. That night at 11 P.M. the eventful order went out from Cleethorpes to all ships and squadrons, "Commence hostilities at once against Germany."

The British war plans were primarily based on the concentration of the main fleet in the north to guard the northern exit of the North Sea and bar Germany's path to the ocean. The protection of the coast was entrusted to patrol flotillas under the Admiral of Patrols (the 8th Flotilla in FORTH, 9th in Tyne, 7th in Humber, 6th at Dover). Behind these plans stood the coastline of Great Britain stretching like a colossal breakwater across Germany's path to the sea. The northern passage between the

Shetlands and Norway, 195 m. wide, could be kept constantly patrolled. The Straits of Dover, only 21 m. wide, lay exposed to attack, but any attacking force was threatened with a heavy counter-attack from the north on its return, and Germany never actually took the risk with her big ships. So long as the enemy refrained from an attack in force the dispatch of British troops across the Channel was no more hazardous than sending them to Ireland. The average time of transport across the Channel was no more than 13 hours, which meant that no transport could ever be more than seven hours from port, leaving an ample margin of time to reach harbour if a German force was reported in the Narrows. The Straits of Dover remained the weak point of the war plans, and there can be little doubt that a determined attack on the Channel at the beginning of the War would have severely shaken the whole structure of British strategy. Germany did not attempt it, and troops poured across the Channel in a continuous stream. To the westward there was only the "Goeben," and on Aug. 10 came the news that she had entered the Dardanelles.

*The Submarine Menace.*—Germany's strategy was defensive. It was based on the idea that the British Fleet would enter the Bight, where it was hoped to wear it down by ruthless mine-laying and submarine warfare. Then when an equality of strength (the greatly desired and much-talked-of *Kräfteausgleich*)

had been attained, a decisive battle would be dared. First a policy of waiting and attrition, then the decisive action. This was the essence of Germany strategy in the North Sea.

In pursuance of these aims, at 2:30 P.M. on Aug. 4 the "Königin Luise," a Hamburg-America liner, was dispatched to lay mines off the Thames. She did not return. Commodore Tyrwhitt was already at sea with the "Amethyst," "Amphion" and the Harwich destroyer flotillas. The "Königin Luise" was sighted on the 5th about 10 A.M., chased by the "Lance" and "Landrail," and sunk some 50 m. east (true) from Lowestoft. But she had laid her mines off Aldeburgh, and the "Amphion," on her way home, ran on one of them and went down in a few minutes with a loss of 150 men. This threat to the North Sea routes emphasised the necessity of minesweeping and started the enormous expansion of that important service, which became one of the principal spheres of naval activity (see MINELAYING AND MINESWEEPING).

For the Germans the problem was to find the British Fleet and, on Aug. 6, 10 German submarines went off into the North Sea to search for it. They found it at sea the same day. A torpedo, fired at the "Monarch," missed; U15 was rammed by the light cruiser "Birmingham" and sunk (58°26' N., 1°58' E.), and U13 never returned. This encounter, however, roused a sense of insecurity on the British side, and that night (10 P.M. on 6th) the commander-in-chief received orders to take his whole force to the northwest of the Orkneys. The menace of the submarine was already beginning to work.

*Protection of the Expeditionary Force.*—On Aug. 5 the Cabinet decided to send the Expeditionary Force to France, Mr. Churchill guaranteed its safety at sea, and Aug. 9 was fixed as the first day of passage. The transports were already assembling at Southampton. The war plans had provided that for this operation the Grand Fleet was to come down as far as the Forth (lat. 56° N.). But it was now west of the Orkneys, and as it remained north of Cromarty (58° N.) till Aug. 15, the burden of protection fell for a time on the Channel Fleet. By Aug. 9 the latter's 18 ships had assembled off Portland. In the Narrows, between Holland and Harwich, Tyrwhitt had 12 to 18 destroyers watching on a 30 m. front. The armoured cruisers "Bacchante," "Cressy," "Hogue" and "Aboukir" were in the Downs, and in the Straits were destroyers of the Dover patrol and Commodore Keyes' 10 submarines. To the westward, cruising from Land's End to Ushant, was Rear-Adml. Rouyer's French force of 14 old cruisers with Rear-Adml. Rosslyn Wemyss' cruiser squadron of four "Talbots." Covered by these forces a steady stream of transports passed across the Channel, rising to the number of 44 on Aug. 14 and remaining well over 30 a day. When the flow of troops was at its height, the Grand Fleet returned to the North Sea and on the 16th swept down to the latitude of the Forth (56° N.) and joined hands for a few hours with the southern forces. Nothing was seen of the enemy. On Aug. 23 the troops were across. Out of 240 transports employed not one had been lost.

To secure the position to the southward, a squadron (cruiser force K) of two battle cruisers, the "New Zealand" and "Invincible," was stationed for a time in the Humber. Hardly had the passage been accomplished than there came news of the terrible retreat in France, and so dangerous did things appear that on Aug. 24 Boulogne was closed and the army base shifted, with an immensity of labour, to St. Nazaire. Mr. Churchill was intent on saving Ostend and for nearly two days (Aug. 26-8) the Channel Fleet was hurrying marines across and tying off Ostend to support their landing. The effort availed little and they were no sooner landed than they were re-embarked. Meanwhile the attention of the German Fleet had been riveted to the Bight. There on Aug. 28 Beatty's battle cruisers had swooped down, driving in the German patrols and sinking the light cruisers "Mainz," "Ariadne" and "Cöln" (see HELIGOLAND BIGHT). This action, fought in Germany's very gate, had weighty consequences, for it confirmed the Kaiser in his decision to follow a strictly defensive policy and hardened him against Von Tirpitz's ardent pleadings for a strenuous offensive.

German naval strategy settled down to a minor warfare of submarines and minelayers, varied by occasional raids against the English coast. The activity of the submarine soon began to be felt. On Sept. 5 U21 at the mouth of the Forth sank the small cruiser "Pathfinder," the first vessel to succumb to the submarine.

Scapa's defenceless state was a source of acute anxiety to Adml. Jellicoe at this time. On Sept. 1 a submarine was reported in the harbour, and the alarm culminated in the battle fleet weighing and putting to sea at night. It withdrew to Loch Ewe on the northwest coast of Scotland, 115 m. to the westward, and was there till Sept. 7, when it was recalled to the North Sea to cover the passage of the 7th Div. to France. Ten days later (Sept. 17) an important conference assembled in the "Iron Duke's" cabin at Loch Ewe. The First Lord was there with the Chief of the War Staff (Rear-Adml. Doveton Sturdee) and there was weighty discussion on the defences of Scapa, the possibility of entering the Baltic and the control of neutral traffic on the east coast. When the First Lord got back to London the German thrust was threatening the Channel ports, and on Sept. 19 orders went out for the Marine Brigade to be landed at Dunkirk. It was the task of the southern force to screen its passage and it came as a severe shock to find cruiser force C swept suddenly off the board.

*Weddingen's Exploit.*—On Sept. 22, patrolling at 10 knots, without a destroyer screen, off the coast of Holland (lat. 52°18' N., long. 3°41' E.), the armoured cruisers "Aboukir," "Hogue" and "Cressy" were torpedoed in quick succession between 6:25 and 7:30 A.M. by U9 (Otto Weddingen); they sank with a loss of 60 officers and 1,400 men. Mr. Churchill on Sept. 18 had suggested that they should not continue on this beat, a view in which the First Sea Lord concurred, but no orders had been issued to withdraw them. The exploit created a profound impression. Weddingen became the hero of Germany. The Belgian coast had to be covered, and it was decided to lay a defensive minefield in the North Sea. On Oct. 2 1914 a large area was notified and the first line was laid between the Downs and Holland. The same day there came the startling news of the Belgian intention to retire from Antwerp.

The First Lord was caught up in the whirl of events and found himself in Antwerp involved "in a hideously critical local situation." The idea of holding Antwerp superseded everything else. The Marine Brigade at Dunkirk was ordered up; the Royal Naval Div., raw and unequipped, was hurried across, and on Oct. 7 the 7th Div. was landed at Zeebrugge; the next day the British force fell back from Antwerp, which surrendered on Oct. 10. These movements brought a heavy strain on the Dover Patrol, which was created a separate command under Rear-Adml. the Hon. Horace Hood on Oct. 13. In the north the commander-in-chief had been ordered, on Oct. 2, to take special measures for the safety of the Canadian convoy, then on its way across, and for eight days the whole fleet was at sea, covering the waters between Scotland and Norway. The battle cruiser "Princess Royal" went out into the Atlantic to screen it, and the convoy of 31 ships arrived safely at Plymouth on Oct. 14. The 10th Cruiser Squadron was still patrolling at 10 A.M. on Oct. 15 off Peterhead, when U9 appeared and sent a torpedo into the old cruiser "Hawke," which sank in a few minutes with a loss of 500 lives. The losses, however, were not all on one side. The British submarine E9 (Lieut.-Comm. Max Horton) lying off Heligoland had sunk the small cruiser "Hela" on Sept. 12.

*Operations off Nieuport.*—A great German attack was gathering at Nieuport, and when General Joffre asked on Oct. 16 for the support of naval guns, Adml. Hood and his light craft hurried across, followed by monitors, and for nearly a week maintained a heavy fire on the German flank. In reply to an urgent call from German army headquarters for action against the monitors, four German destroyers left the Ems on Oct. 17 to lay mines off the North Foreland. They were met by the "Undaunted" (Capt. Cecil Fox) and four Harwich destroyers ("Lennox," "Lance," "Legion" and "Loyal") in the Nar-

rows and after a sharp fight and chased the last German boat was sunk off the Texel at 4:30 P.M.

In Scapa Flow there had been another submarine alarm. In the afternoon of Oct. 16 a supposed submarine was reported off the main entrance, and again the fleet raised steam and put to sea by night. This time the commander-in-chief decided to take the fleet around to Lough Swilly (Ireland). Its arrival there, on Oct. 22, meant a serious dislocation of the war plans, which were beginning to give way both in the north and south, through the pressure of the submarine. The remedies were simple. In the north an efficient boom, in the south an ample supply of effective mines, but these requirements were not forthcoming at the time. The sinking of the German destroyers had, however, given an assurance of safety to Hood's flotilla on the Belgian coast, but on Oct. 26 the German army swept down like an avalanche threatening to seize the sluices and engulf the whole Belgian line. The old battleship "Venerable" was dispatched to Hood and, while the culverts were being bricked up in breathless haste, the crash of her 12-in. guns enabled the Belgians to hold on for a few days till the waters rising round the sluices forced the Germans to retire. Again the German army called for help to the navy, but U19, hurrying down, was rammed by the "Badger" (Comm. Chas. Fremantle); U28 was hunted, by another destroyer and got into a trawler's net; and only U27 reached the Straits of Dover, where it sank the old cruiser "Hermes" (transformed into an air carrier) on Oct. 31.

In the north the move to Lough Swilly had been unfortunate. Two days before the battle fleet left Scapa, the "Berlin," a large Norddeutscher-Lloyd, had left the Jade and on Oct. 23 laid mines some 26 m. northwest of Lough Swilly. On the 26th the dreadnought battleship "Audacious" (Capt. Cecil Dampier) struck one of them. The White Star liner "Olympic," outward bound, came up and tried to tow her in, but she was still some 15 m. from Lough Swilly when she sank and blew up at 9 P.M. Her loss was kept a profound secret in Great Britain, and a whole fortnight elapsed before it was known with certainty in Germany. With the Grand Fleet 300 m. from the North Sea, the original war plans were giving way, and the commander-in-chief went up to confer with the Admiralty. It was a new board that he met. Prince Louis of Battenberg (Marquis of Milford Haven), who had given the order for the First Fleet to stand fast on July 26, had resigned and Lord Fisher had taken his place. It was decided that the 3rd Battle Squadron of "King Edwards" should come down to reinforce the Channel Fleet, and, to secure the approach to Dover, mines were to be laid in the North Sea, which was declared a military area on Nov. 2. It was announced that all ships passing northabout did so only at their peril, and all ships were advised to go and come by the English Channel.

**First German Raid.**—The notification was barely issued when on Nov. 3 a German raid was made on the east coast by the battle cruisers "Seydlitz," "Moltke," "Von der Tann" and "Blucher," with three light cruisers escorting the "Stralsund," with the object of laying a minefield on the British coast some 15 m. from Yarmouth. The morning was misty; the Germans, after laying their mines, engaged the patrols, dropped a number of rounds harmlessly on the beach near Yarmouth, and made off. Adml. Beatty with the battle cruisers put to sea from Cromarty, but by 4 P.M. the Germans were well on their way to the Bight and he was ordered to return. Hipper got safely back at 11 P.M. but the next day the armoured cruiser "Yorck" struck a German mine in the Jade and sank. This was the first sortie of the High Sea Fleet. The commotion had hardly died down when on Nov. 4 a telegram arrived from the British Consul-General at Valparaiso with the news of Coronel (*see* CORONEL) and the whole system of trade defence began to tremble under the menace of Von Spee. This is a milestone in the naval war and to understand it we must leave home waters for a time.

## II. CRUISER WARFARE

Outside home waters the principal task of the British Navy was the protection of trade, for which purpose cruiser squadrons

were stationed at the focal points of maritime traffic. The number of German cruisers abroad was comparatively small. The largest squadron, whose influence was felt in every sea, was in the Pacific commanded by Vice-Adml. Graf von Spee, consisting of the armoured cruisers "Scharnhorst" and "Gneisenau" (each 8 8·2-in., 8 5·9-in.) and the light cruisers "Emden," "Nürnberg" and "Leipzig." In the East Indies was the "Königsberg" (10 4·1-in., 23·5 knots) and in the Atlantic the "Dresden" and "Karlsruhe," armed with 12 4·1-in. and with a speed of 24 and 27·6 knots respectively.<sup>1</sup>

At the outbreak of war, the Admiralty was faced with insistent demands for convoy which would not be denied. In the East the whole of the East Indies squadron was engaged in the convoy of troops from India, and the convoy of the expeditions to New Guinea and Samoa occupied the whole Australian squadron for a time. The Cape, the Cameroons and British East Africa all made similar demands, and the system of patrolling focal areas was constantly threatening to break down in the attempt to meet these urgent calls.

**Cradock's Pursuit of the "Dresden."**—When war broke out, the "Karlsruhe" had just relieved the "Dresden" and both were still in the West Indies. In New York were several fast German liners, but the "Kronprinz Wilhelm" was the only one that actually put to sea. On Aug. 6 she was being armed and equipped by the "Karlsruhe" at a rendezvous some 120 m. northeast of Watling Island (off Cuba), when the "Suffolk," Cradock's flagship at the time, came upon them at 11 A.M., but after a long chase and night action with the "Bristol" the "Karlsruhe" got away. Then there came news of her and of the "Dresden" to the southward, and on Aug. 22 Cradock, who had transferred his flag to the "Good Hope," went off in pursuit and began his fateful journey to the south. The "Karlsruhe" remained in the West Indies and South Atlantic. The liner "Kaiser Wilhelm der Grosse," the only merchant cruiser which had succeeded in slipping out of the North Sea (on Aug. 5), was trying to get in touch with her but on Aug. 26 was caught coaling at Rio Ouro, a desolate anchorage on the Sahara coast, by the British cruiser "Highflyer" (Capt. Henry T. Buller) and after a short action was sunk. The "Karlsruhe" (Commander Kohler) continued her depredations on trade for some months, and up to Nov. 4 had captured or sunk 17 ships (76,609 tons registered) when she suddenly blew up in the West Indies (lat. 11°7' N, long. 55°25' W.).

On Sept. 3 Rear-Adml. Sir Christopher Cradock was appointed to command on the southeast coast of America. He was given the two armoured cruisers "Good Hope" and "Monmouth," the light cruisers "Glasgow" and "Bristol" and the armed merchantmen "Otranto," "Carmania" and "Macedonia." There ensued a hunt for the "Dresden" down the coast of South America. The "Carmania" (Capt. Noel Grant, 8 4·7-in.) went off to Trinidad, a tiny islet (lat. 20°30' S., long. 29°22' W.) 600 m. out in the South Atlantic, and there on Sept. 14 came upon a German armed merchantman, the "Cap Trafalgar" (2 4·1-in.), coaling. An action ensued, the "Cap Trafalgar" was sunk and the "Carmania" limped back to Gibraltar for repairs. Meanwhile the "Dresden" (Capt. Lüdecke), with two colliers, the "Baden" and "Santa Isabel," had sped south to a little harbour, Orange Bay, hidden away in Hoste Island in the vicinity of Cape Horn, where she lay from Sept. 5 to 16. In the Atlantic she had sunk only two ships.

Von Spee had been located at Ponape in the Caroline Islands on Aug. 9, and on Sept. 15 Cradock, then at Santa Caterina (Brazil), received an important message sent on Sept. 14 from the Admiralty. He was told that there was strong probability of Von Spee's arriving in Magellan Straits and that the armoured cruiser "Defence" (4 9·2-in., 10 7·5-in.) and the old battleship "Canopus" (4 12-in., 12 6-in.) were being sent out to reinforce him. He was to keep the "Canopus" and "Monmouth" with him, until the "Defence" joined, then concentrate a squadron

<sup>1</sup>Three battleships to Grand Fleet as minebumpers on 7/8/17. 6th B.S. ceased to exist 8/8/17, and 7th was merged with 8th, leaving Channel Fleet composed of 5th and 8th B.S.

strong enough to meet Von Spee, "search Magellan Straits, break up German trade and destroy the German cruisers." But the very next day, Sept. 16, the Admiralty heard that von Spee had appeared off Samoa on the 14th; and Cradock was informed that the situation had changed; "cruisers need not be concentrated and German trade on the west coast was to be attacked at once." This second telegram was the beginning of a chapter of misfortunes. The situation on the southeast coast had not changed; it had merely been postponed; concentration and reinforcement were as necessary as ever, but the order to the "Defence" to proceed to the southeast coast was cancelled without Cradock's being informed of it. He was at Montevideo when he received this telegram on Sept. 17 and proceeded south with his squadron on the 22nd. For another reason, Sept. 15 stands out as a red-letter day in cruiser warfare, for on it came the news that the "Emden" had burst into the Bay of Bengal. She had parted from Von Spee and the "Scharnhorst" on Aug. 14.

*Von Spee's Force.*—Von Spee was at Ponape in the Carolines when war broke out. Thence he went to Pagan in the Marianas Islands, where the "Emden" brought him a dozen supply ships from Tsingtao. The squadron proceeded eastward to Eniwetok (Aug. 19) in the Marshall Islands; then on to Majuro in the same group, arriving on Aug. 26, where Von Spee, having heard on Aug. 25 of Japan's declaration of war, finally abandoned all idea of return. His next port of call was Christmas Island, in the very middle of the Pacific, where he arrived on Sept. 7. On his way he heard of the fall of Samoa and, after coaling from his colliers at Christmas Island, proceeded there on Sept. 9, hoping to surprise any British ships in the vicinity. But when he arrived at 3 A.M. on Sept. 14, the harbour was empty. The report of his visit was passed by wireless to Suva in Fiji and thence by cable to New Zealand and London, where it arrived early on Sept. 16. In China it left Adml. Jerram's forces free to hunt the "Emden" down, and in Australia removed all anxiety as to the expedition to New Guinea and the homeward-bound convoy of Australian troops.

*China Squadron.*—In China the effective force of the commander-in-chief, Vice-Adml. Sir Thomas Jerram, consisted of the old battleship "Triumph," the armoured cruisers "Minotaur" (Capt. Edward Kiddle, 4 9·2-in., 10 7·5-in.) and "Hampshire" (Capt. H. W. Grant, 4 7·5-in., 6 6-in.) and the light cruiser "Yarmouth" (Capt. H. L. Cochrane, 8 6-in.). Japan's entry into the War on Aug. 23 secured the China seas and Jerram, leaving only the "Triumph" (Capt. Fitzmaurice) and destroyer "Usk" to assist in the investment of Tsingtao, took his ships south to secure the road to the East Indies. On Aug. 23 came instructions from home to proceed in search of the "Scharnhorst" and "Gneisenau" and keep in touch with Rear-Adml. Patey in Australia, but as nothing was known of the German ships, Jerram, on his arrival at Singapore on Aug. 30, sent his cruisers to search the Dutch East Indies, where 22 German merchant ships had taken refuge.

This search lasted till Sept. 13, but already demands for convoy had begun to dislocate his plans. On Sept. 8 the Admiralty ordered him to send his two best ships, the "Minotaur" and "Hampshire," to meet the Australian convoy, which was due to leave Fremantle for Europe on Oct. 3. The Vice-Adml. decided to send the "Minotaur," in the meantime, with two Japanese ships, the battle cruiser "Ibuki" (4 12-in., 8 8-in.) and cruiser, "Chikama" (8 6-in.), to Rabaul in New Britain to cover Australia, when suddenly the situation in China was changed on Sept. 15 by the news of von Spee's appearance off Samoa, and more imperatively by the simultaneous appearance of the "Emden" in the Bay of Bengal. Till the "Emden" was finally run down by the "Sydney" at Cocos Island on Nov. 9 Jerram's ships were almost wholly engaged in hunting for her in the East Indies.

In Australia the same influences had been at work. On the outbreak of War Rear-Adml. Sir George Patey had decided to take up a position at Port Moresby in the Gulf of Papua, British New Guinea (lat. 9° 28' S., long. 147° 9' E.), covering Australian

waters and within reach of the two principal German harbours, Rabaul (or Simpsonhafen) in New Britain and Friedrich-Wilhelmshafen (Madang) in New Guinea. Demands for convoy began even earlier than at Singapore to dislocate his plans. New Zealand's expedition to capture Samoa was ready to go on Aug. 18 and the Admiralty approved of its starting, directing Patey on Aug. 13 to give it naval support. But no sooner had he arranged to meet it with the battle cruiser "Australia" and the "Melbourne" 450 m. south of Fiji on Aug. 24 than the Australian Navy Board asked that their expedition to New Guinea should be taken first. Finally it was decided that the cruiser "Sydney" should take the New Guinea force as far as the Barrier Reef, on the east coast of Australia, and then wait for the "Australia" and "Melbourne" to return from Samoa. This was done. The "Australia" arrived at Samoa on Aug. 29, the force was landed, the British flag hoisted, and she left the next day to join the New Guinea force.

But now the demands of the European convoy came flooding in. Patey was then engaged in the New Guinea operations. Rabaul was occupied on Sept. 13, and on Sept. 15 the news of Von Spee's visit to Samoa cleared up the situation. Friedrich-Wilhelmshafen was occupied on Sept. 24 and Angaur wireless station was destroyed by the "Sydney" on Sept. 26. When news arrived of Von Spee's appearance off Tahiti on Sept. 22, Patey received orders to take his squadron to Suva (Fiji) to bar the road to his return, and sailed from Rabaul on Oct. 3.

It had been intended that the Australian convoy should leave Fremantle on Oct. 5, escorted by the "Minotaur," "Sydney" and "Ibuki," but New Zealand refused to let her transports proceed to Australia without a strong escort and the "Minotaur" and "Ibuki" had to trail the whole way to Wellington to bring them on. This meant a delay of three weeks and it was not till Nov. 1 that the great convoy of 37 transports left King George's Sound, Albany, escorted by the "Melbourne," "Minotaur" and "Ibuki." The "Sydney," too, was with them on the road that was to lead her to the "Emden" and to victory and fame.

*Cradock's Force.*—Meanwhile, in the Atlantic Cradock had gone from Montevideo to the southward and by Sept. 28 his ships stood before the Magellan Straits, and started searching the creeks and crannies of Tierra del Fuego. On Oct. 3 the "Glasgow" and "Monmouth" went off to the west coast to attack German trade in accordance with the Admiralty telegram of Sept. 16, but the "Good Hope" remained in the Falklands area, waiting for the "Canopus." Von Spee had been reported a second time off Tahiti in the Society Islands on Sept. 22, and on Oct. 5 was again located by an intercepted wireless to the "Dresden," which stated that he was on his way to Easter Island. No shadow of doubt could remain that he was on his way across the Pacific, and the Admiralty on Oct. 5 sent word to Cradock to be prepared to meet him, adding that the "Canopus" should accompany the "Glasgow," "Monmouth" and "Otranto" in their search. The idea can be regarded as sound on only the assumption that Cradock was expected only to find and locate Von Spee, for, tied to a battleship which could not be trusted to go more than 15 knots, his armoured cruisers could not be expected to attack or pursue a fast and powerful enemy.

Cradock received the message on Oct. 7, and on the 8th sent a message to say that he was concentrating at the Falklands, and suggesting the formation of a strong second squadron on the east coast to intercept the German squadron if it should evade him. The telegram reached the Admiralty on the 11th, and the armoured cruisers "Defence" and "Kent" (14 6-in.) were immediately ordered to reinforce Rear-Adml. Stoddart on the east coast. The First Lord (Mr. Winston Churchill) also recommended the postponement of Cradock's cruise to the west coast, but the reply actually sent to him merely took the form of "concurring" in the "concentration" of his vessels "for combined operations." The "concentration" at the Falklands never materialised. The "Good Hope" left for the west coast (via Cape Horn) on Oct. 22, leaving the "Canopus" to follow with her colliers (via Magellan). Cradock's conception of the situation

will never be known. He probably felt it incumbent on him to support the "Glasgow" and "Monmouth." There was a vagueness at both ends of the wire. Cradock spoke of concentrating at the Falklands, when half his squadron had already gone to the east coast. The Admiralty, knowing that the "Glasgow" and "Monmouth" had gone to the west coast, concurred in a concentration for "combined operations," whatever that might mean. But the Admiralty's readiness to reinforce Stoddart, at Cradock's suggestion, indicates that it would have been equally ready to reinforce Cradock if he had asked for it. But neither in his telegrams nor in his last dispatch of Oct. 12 did he suggest, much less definitely state, that his squadron was too weak to face the foe. There was one vessel which might have saved the situation, namely the battle cruiser "Australia," if Cradock had been told to wait for her, but in response to urgent representations from New Zealand, she had been retained off Fiji, and remained there straining on her leash.

*Coronel and the Falkland Islands.*—Von Spee was then at Masa-fuera (Oct. 18–26), a small island 450 m. from the coast of Chile, and the two squadrons were approaching one another, for Cradock had joined the "Glasgow," "Monmouth" and "Otranto" at Vallenar in Chonos Archipelago (lat. 45° 24' S., long. 74° 18' W.) on Oct. 27. The squadrons met off Coronel on Nov. 1, the "Good Hope" and "Monmouth" sank in the Pacific, the "Glasgow" and "Otranto" got away. The "Canopus" was 300 m. off at the time toiling northward with her colliers at 12 knots (see CORONEL).

The news arrived in England on the morning of Nov. 4 and fell on the country like a thunderclap. Lord Fisher was then First Sea Lord and every effort was made to redeem the situation. The battle cruisers "Invincible" and "Inflexible" were taken from the Grand Fleet and sailed from Devonport on Nov. 11 with Vice-Adml. Sir Doveton Sturdee, late chief of the War Staff, in command. Rear-Adml. Stoddart was waiting for him at Abrolhos Rocks off the coast of Brazil, with the "Carnarvon," "Cornwall," "Defence" and "Kent," while Von Spee, unaware of the thunderbolt launched at him, had visited Valparaíso and was on his way southward. Sturdee coaled at Abrolhos Rocks and rushed on with his ships ("Inflexible," "Invincible," "Carnarvon," "Cornwall," "Kent," "Glasgow," "Bristol" and "Orama") to the south, arriving at Port William, Falkland Islands in the forenoon of Dec. 7. The "Australia" meanwhile was speeding across the Pacific, while a strong Japanese squadron had taken her place off Fiji. Von Spee passed the Horn in a gale at midnight on Dec. 1. The next day he met a Scottish barque, the "Drummuir" with 2,800 tons of coal, and put back to Picton Island near Beagle Channel to transfer her coal. The "Drummuir" was sunk on Dec. 6 and with her sank Von Spee's hope of getting home. He had decided at Picton Island to make a raid on the Falklands. On Dec. 8, at dawn, the islands were in sight and the "Gneisenau" and "Nürnberg" were sent in towards Port William. In the battle which followed (see FALKLAND ISLANDS BATTLE) the "Scharnhorst," "Gneisenau," "Leipzig" and "Nürnberg" were sunk and Von Spee and his two sons perished. The battle stands as one of the great beacons of the naval war, marking the collapse of German sea power in the outer seas.

*The Emden.*—The "Emden's" career in the East Indies had already come to an end with a tale of 15 ships. She had ranged the Bay of Bengal from Sept. 7–25, bombarded Madras on Sept. 22, cruised in the approach to Colombo till Oct. 21, coaling in the Maldivé Islands and at Diego Garcia, and raided Penang on Oct. 28. The armoured cruisers "Hampshire" and "Chikuma," the armed merchant cruiser "Empress of Asia" and light cruiser "Yarmouth" were all chasing her in vain pursuit, though the "Hampshire" just missed her on Oct. 21 and the "Yarmouth," on Oct. 9 sank two of her supply ships at Pulo Tapak on the west coast of Sumatra. At dawn on Nov. 9 she appeared off the cable station at Cocos, Keeling Island, where the operator promptly sent out an S.O.S. to all ships, and flashed the news by cable to Singapore just as the boats of the German landing party grounded on the beach before his door. The big

convoy of 37 transports bound for Europe from Australia and New Zealand had left Albany on Nov. 1 and, escorted by the "Melbourne" (Capt. M.L'E. Silver), the "Sydney" and Japanese battle cruiser "Ibuki," was at the moment approaching Cocos. It was only 55 m. off when the "Melbourne" received the S.O.S. and the "Sydney" was sent off to Cocos Island at full speed. The "Emden" (Comm. Karl von Müller, 10 4 1-in. had not even time to get her landing party on board. The "Sydney" (Capt. J. C. Glossop, 8 6-in.) came down on her suddenly and at 11:30 A.M., after a sharp fight, drove her ashore, a blazing wreck.

There remained then only the "Dresden," hiding in the ice creeks of Tierra del Fuego, and the "Königsberg," shut up in the swamps of the Rufiji river (German East Africa) both powerless for harm. By the end of 1914 the ocean passages were secure. Samoa and New Guinea had fallen; a Japanese guard stood in the gates of Tsingtao. In the Cameroons, Duala, Buea and Victoria had been occupied with the help of a naval squadron under Capt. Cyril M. Fuller, and his ship the "Cumberland" joined the stream of British cruisers homeward bound.

*Hipper's Raid.*—At home the old battleship "Bulwark" had been blown up by an internal explosion at Sheerness on Nov. 26. The Germans had continued their policy of raids and minelaying. On Dec. 15 Rear-Adml. Hipper left the Jade with a force of four battle cruisers, three light cruisers, 18 destroyers and the "Kolberg" with mines on board. Behind him in support came the German battle fleet of 14 dreadnoughts and eight Deutschlands.

The Admiralty, warned by German signals of Hipper's sortie, but not knowing that their battle fleet was out, dispatched a force including the 2nd Battle Squadron (Vice-Adml. Sir George Warrender) and the 1st Battle Cruiser Squadron under Vice-Adml. Beatty, mustering in all six dreadnoughts, four battle cruisers, four armoured cruisers, four light cruisers and seven destroyers, to a position near the Dogger Bank (lat. 54° 10' N., long. 3° 0' E.) to intercept Hipper. At 5:20 A.M. on Dec. 16 the destroyer "Shark" (Comm. Loftus Jones), 10 m. on Beatty's port beam, struck the destroyers ahead of the German battle fleet. The destroyer action which ensued caused Adml. von Ingenohl, who was then only some 30 m. from Warrender's force, to turn back and make for home.

Hipper meanwhile had reached the coast at 6:40 A.M. After bombarding Hartlepool at 4,000 yd. (killing 103 civilians and wounding 344) and also Scarborough (17 killed, 99 wounded), he had laid his mines five miles off Scarborough and at 9:40 A.M. was making for home. Warrender and Beatty were then some 140 m. to the east, making straight for him. But by noon a heavy sea was running with mist and rain. Hipper's light craft, 50 m. ahead of him, emerged suddenly at full speed from the mist, and after a running fight for 20 min. with the "Southampton" and "Birmingham" (lat. 54° 36' N., long. 1° 55' E.), disappeared. Hipper, hearing from them of the British force in front of him, made a long détour to the north and got safely home. This was apparently the first occasion on which the German movements were successfully anticipated by their own signals.

### III. THE DARDANELLES

The year 1915 began badly. At 2:20 A.M. on Jan. 1 the old battleship "Formidable" (Capt. Arthur Loxley) cruising with the Channel Fleet, was sunk by U24 off Start Point. But later in the month, on Jan. 24, Hipper and his battle cruisers suffered a heavy blow at the battle of the Dogger Bank (see DOGGER BANK) where the Germans lost the "Blücher." Adml. von Ingenohl was superseded and Adml. von Pohl, chief of the staff, took his place in command of the High Sea Fleet, charged to observe a still more cautious policy. The successes of Von Weddigen had led the German naval staff to favour submarine warfare, which opened with the declaration of a war-zone round the British Isles on Feb. 4 (see SUBMARINE WARFARE). These views were no doubt strengthened by the final collapse of their cruiser warfare abroad. The "Dresden," lurking since the Battle of the Falklands in the fiords of the Magellan Straits, had crept

back into the Pacific to meet a German collier off Juan Fernandez (Chile). The "Kent," searching for her with the "Glasgow" in Magellan Straits, heard of it and hastened north. On March 7 she was at the rendezvous, but the "Dresden's" speed enabled her to get away. The "Glasgow," however, had made out the words "Juan Fernandez" in a signal and there in Cumberland Bay on March 14 at 8:50 A.M. the "Glasgow," "Kent," and "Orama" found her and brought her career to an end (her casualties numbered 7 killed and 15 wounded).

**Dardanelles Plan Broached.**—In Europe the centre of interest was shifting to the Dardanelles. The German Fleet rarely left the Bight. A deadlock seemed to have arisen and the idea of an attack on the Dardanelles was mooted, challenging even the Grand Fleet in its insistency and swallowing the Channel Fleet at a gulp. The scheme offered advantages of the first magnitude, strategic, diplomatic and economic, but its beginning was marred by the idea of a "purely naval enterprise," arising in its turn out of Lord Kitchener's refusal to supply troops for a combined operation, and by the failure to appreciate that a naval bombardment must imperil the success of any subsequent combined operation, where surprise was the essence of success. It began with a request from Petrograd on Jan. 2 for a diversion to relieve the Russians in the Caucasus. The idea of the Dardanelles was broached. Vice-Adml. Sackville Carden, senior officer in the Mediterranean, gave his opinion on Jan. 5 and 11 that the Dardanelles might be forced by "extended operations," a phrase which soared easily over a multitude of difficulties. The First Lord (Mr. Winston Churchill) waxed enthusiastic over it. Lord Fisher consented to the new battleship "Queen Elizabeth" doing her gunnery trials there, and Mr. Churchill saw her creeping relentlessly forward with the forts disappearing one by one in clouds of dust before her 15-in. shell. Aerial reconnaissance and the great range of naval guns were supposed to have revolutionised bombardment and it was thought that the proposition was worth a trial. On Jan. 13 the War Council agreed that the Admiralty should prepare for a naval expedition in Feb. to bombard and take the Gallipoli Peninsula with Constantinople as its objective. Lord Fisher and Sir James Murray, chief of the General Staff, were ominously silent.

The result was an endeavour to perform a task of first-class magnitude with second-class material and insufficient preparation. Aerial reconnaissance in conjunction with naval guns was not then born. To force the Straits a nucleus of the best artillery, the best minesweeping vessels in the fleet and at least two score of first-class airmen would have been required. These were not forthcoming, and apart from this need the whole conception was strategically weak, for the fleet, even if it broke through, would have been left in the air in the Sea of Marmora, relying on the precarious chance of a revolution in Turkey.

But by Feb. 1915 the idea of a "purely naval enterprise" was being abandoned. A military force was to be available "to reap the fruits." The opinion found favour that if the navy failed, the army should help—a conception utterly contrary to the generally accepted strategy of combined operations. Lord Fisher's attitude of lukewarm acquiescence had changed by then to one of downright disapproval, but his arguments were blunted by his passionate adherence to the idea of a great landing in the Baltic, a plan even more difficult and dangerous. The War Council approved of the project on Jan. 28, bringing Lord Fisher to the verge of resignation.

**Bombardment of the Forts.**—The main naval force assembling for this purpose consisted of two modern and 12 older battleships, drawn from the Channel Fleet and every quarter of the globe, and four old French battleships, viz.: "Queen Elizabeth" (Capt. Geo. Hope, 8 15-in.), "Inflexible" (Capt. R. F. Phillimore, 8 12-in.), "Agamemnon" (Capt. H. Fyler, 4 12-in., 10 9-2-in.), "Lord Nelson" (Capt. J. W. McClintock, 4 12-in., 10 9-2-in.), "Vengeance" (Capt. Bertram Smith, 4 12-in., 12 6-in.), "Albion" (Capt. Alg. Heneage, 4 12-in., 12 6-in.), "Irresistible" (Capt. Douglas Dent, 4 12-in., 12 6-in.), "Triumph" (Capt. Maurice Fitzmaurice, 4 10-in., 14 7-5-in.), "Cornwallis" (Capt. Alex Davidson, 4 12-in., 12 6-in.), "Ocean" (Capt. A.

Hayes Sadler, 4 12-in., 12 6-in.), "Swiftsure" (Capt. Cecil Lefroy, 4 12-in., 12 6-in.), "Canopus" (Capt. Heathcote Grant, 4 12-in., 12 6-in.), "Prince George" (Capt. A. V. Campbell, 4 12-in., 12 6-in.), "Majestic" (Capt. H. F. Talbot, 4 12-in., 12 6-in.), "Suffren" (Rear-Adml. Guepratté, 4 12-in., 10 6-4-in.), "Bouvet" (Capt. de la Touche, 2 12-in., 2 10-8-in.), "Charlemagne" (Capt. Lagresille, 4 12-in., 10 5-5-in.), "Gaulois" (Capt. Biard, 4 12-in., 10 5-5-in.). It was under the command of Vice-Adml. Sir Sackville Carden with Commodore Roger Keyes as his chief of staff. Rear-Adml. John de Robeck was in the "Vengeance," and at Port Mudros in Lemnos, Rear-Adml. Rosslyn Wemyss was busy making a base for the armada out of nothing.

At 8 A.M. (times are East European) on Feb. 19 the attack on the four outer forts was commenced by eight ships—the "Inflexible," "Agamemnon," "Cornwallis," "Vengeance," "Triumph," "Bouvet," "Suffren" and "Gaulois." The ships first

engaged at long ranges; the forts were apparently silenced and the ships closed to medium ranges (7,000 yd.) at 2 P.M.; when failing light put a stop to the operation, Orkaniye alone was maintaining a fitful fire. On Feb. 25 the operations were resumed. The "Queen Elizabeth," assisted by the "Agamemnon," put both the guns at Helles out of action; the Qum Qal'e forts on the Asiatic side were dealt with by the "Irresistible," "Gaulois," "Suffren" and "Charlemagne" and by 5:15 P.M. all the outer forts were effectually silenced. The fleet anchored that night full of hope and confidence, while the minesweepers entered and swept a channel four miles up. But the outer forts were merely the outworks of the position. The real dangers loomed at the Narrows, where a channel only a mile wide was defended by nine lines of mines and commanded by heavy batteries, mounting 6 14-in. guns, 6 11-in. and at least two score 10-2-in. and 9-4-inch.

**Attempt to Sweep the Narrows.**—The next fortnight (March 3-17) was occupied with an attempt to sweep the channel by night and reduce the forts by day. On March 5 the "Queen Elizabeth" opened indirect fire on the Kilit el Bahr forts, shelling them over the hills from the west side of Gallipoli and apparently putting Hamidiye II. out of action. Indirect fire was continued the next day on Hamidiye I. and II. at 21,000 yd., while the "Vengeance," "Albion," "Majestic," "Prince George" and "Suffren," inside the Straits, engaged Forts Dardanus and Mes'udiye half-way up. The air reconnaissance available was of little use, and hidden howitzers forced ships to keep on the move and prevented their observing the fire.

On March 7 the French battleships engaged Fort Dardanus, and the "Lord Nelson" went up and engaged Mejdidiye and Hamidiye II. in the Kilit el Bahr group at a range of 12,000 yards, apparently silencing them. Meanwhile the progress of the mine-

sweepers was poor. It was here that the principal difficulties arose. The minesweeping force was too feeble for its colossal task, and its trawlers, which could make no more than four knots against the current, were an easy target for the Turkish guns. On March 10 they went up at night, supported by the light cruiser "Amethyst" (Comm. G. J. Todd) and the "Canopus." Two trawlers were hit by 6-in. shell, one was sunk by a mine and the whole force had to be reorganised and manned with naval ratings. At home the First Lord was growing insistent, and on March 11 sent a telegram to the Vice-Adml., urging a decision, and suggesting that the point had been reached when it was necessary to "overwhelm" the forts at the Narrows at decisive range. Everything now hinged on clearing the minefields. On the night of March 13-4, seven trawlers and five picket boats manned by volunteers made a determined effort to sweep the channel, supported by the "Amethyst" and "Cornwallis." They were driven back at 3:50 A.M. under a tornado of fire. The "Amethyst" received nine hits and had 22 killed and 38 wounded. The result effectually demonstrated the insuperable difficulty of sweeping under fire by night, and it was decided to attempt it by day under cover of a heavy bombardment.

*The Final Attack.*—Vice-Adml. Carden's health broke down and the final attack took place on March 18 1915 under Vice-Adml. John de Robeck. It was a clear sunny day when the "Agamemnon" at 10:30 A.M. led the fleet into the Straits. At 10:45 the "Queen Elizabeth," "Inflexible," "Agamemnon" and "Lord Nelson" engaged the batteries at the Narrows at 16,000 yd., while the "Triumph" and "Prince George" kept down the fire of the forts and howitzers on the adjacent shores. After a bombardment of about an hour and a half the four French battleships advanced as far as Kephez and engaged the Narrows forts at about 9,000 yards. The fire of the forts was slackening, when at 1:45 the "Vengeance," "Irresistible," "Albion," "Ocean," "Swiftsure" and "Majestic" were ordered to relieve the French line. As the "Bouvet" retired, she was struck by a mine or shell at 1:50 P.M. and sank in two minutes with the loss of all but a score of her crew. The minesweepers had got their sweeps out and by 3:10 P.M. were proceeding up stream. Up to this point the day had gone fairly well though the "Inflexible" had been badly hit by howitzers posted near Eren Kōi. Her forebridge was set on fire, the control station on the foremast put out of action and Comm. Verner, her gunnery officer, mortally wounded. No other ship, however, had received serious damage.

By this time the position in the Turkish forts was growing critical. The supply of modern ammunition was scanty, several guns were out of action and nearly all were choked with sand and dirt from the terrific earth spouts cast up by the English shell. Hamidieh I. alone, manned by German gunners, was firing steadily. Then came the climax within one short hour. Shortly after 4 P.M. the "Inflexible" struck a mine and only with difficulty reached Tenedos, where she had to be beached. At 4:15 the "Irresistible" struck another; the general recall was flying, when the "Ocean," going to help her, met the same fate at 6:05 P.M. and both had to be abandoned. All this happened in Eren Kōi Bay on the Asiatic side, only four or five miles from the entrance, where mines had been laid by the Turks on March 8. The "Suffren" and "Gaulois" were also so severely injured by gunfire that they had to be docked. Out of 18 battleships, three had been sunk and three disabled. On the Turkish side eight guns had been put out of action, and four officers and 40 men killed, but the minefields remained practically intact. The fleet had attempted too much. To force a channel defended by a minefield and heavy batteries was a task of the first magnitude, beyond the compass of de Robeck's force. On March 23, after a conference with Gen. Sir Ian Hamilton, de Robeck decided that he must keep the fleet intact to assist in the landing operation. Mr. Winston Churchill urged the admiral to renew the attempt to break through, but Lord Fisher would not agree.

This was the end of the "purely naval enterprise." Sir Ian Hamilton had arrived without plans; the transports had not been loaded for an immediate landing; a month elapsed before

the army could make their attack, and in that month the peninsula was converted into a fortress.

*The Gallipoli Landing.*—It was now the task of the navy to prepare to support the landing. This did not take place till April 25. The naval force acting in support numbered 18 battleships, 12 cruisers, 29 destroyers and eight submarines, while a great armada of transports and auxiliary craft assembled gradually behind them at Port Mudros in Lemnos (Greece). The whole shore of Gallipoli had been reconnoitred and six beaches chosen for the landing on the 12-mile strip of coast, stretching northward from the northern entrance of the Straits. These were designated by the letters S (just inside the Straits), V (just west of Sedd el Bahr), W (by Cape Teke), X (1 m. north of W), Y (1 m. north of X) and Z (10 m. north of Y), near Gaba Tepe, to be christened in a baptism of fire with the new and splendid name of Anzac.

The force to be landed numbered 75,000 with 140 guns. The ships were divided into "covering" ships (to support the landing with their fire) and "attendant" ships (to carry the troops and assist in their landing). The landings at the nose of the peninsula that is at S, V, W, X and Y beaches, were under Rear-Adml. Rosslyn Wemyss with seven battleships, viz.: the "Lord Nelson," "Swiftsure," "Implacable," "Cornwallis," "Vengeance," "Albion" and "Prince George" and four cruisers, the "Euryalus" (Capt. R. Burmester, 2 9.2-in., 12 6-in.), "Talbot" (Capt. F. Wray, 11 6-in.), "Minerva" (Capt. P. Warleigh, 11 6-in.), and "Dublin" (Capt. John Kelly, 8 6-in.). The landing at Anzac was under Rear-Adml. Cecil Thursby with five battleships, the "Queen" (flag, Capt. H. A. Adam), "Prince of Wales" (Capt. R. Bax), "London" (Capt. J. Armstrong), "Triumph" and "Majestic," and one armoured cruiser, the "Bacchante" (Capt. Hon. Algernon Boyle, 2 9.2-in., 12 6-in.).

These last six ships left Port Mudros in the afternoon of the 24th. The night was calm without a breath in the air or ripple on the sea. The moon set at 3 A.M. and it was dark when they approached the coast. Of the advanced force for Anzac, 1,500 men were in the "Queen," "Prince of Wales" and "London," each of which was provided with four tows of six boats; the remaining 2,500 were in seven destroyers, each towing six life-boats. The rest of the force was following in 40 transports. The ships stopped two miles from the shore, and the steam picket boats started off with their tows in dead silence. At Anzac by good fortune the boats struck the beach a mile and a half north of the intended spot, which had been strongly entrenched. The Australians leapt into the water, rushed the Turks up the hills and out of them. By 5:30 A.M. the whole of the advanced force was ashore at Anzac.

At Y Beach the advanced force was landed in four trawlers, each towing six boats supported by the cruisers "Sapphire" (Comm. P. W. Hill), "Amethyst" and the "Goliath" (Capt. T. L. Shelford), and was ashore at 7:15 A.M. At X Beach the advanced force was in the "Implacable" (Capt. H. C. Lockyer). The captain dropped anchor close in, veered till the ship was almost aground, then let fly with all her guns just over the beach, raising such a dust and smoke and din that the troops landed there with hardly any casualties. W Beach was bristling with wire and flanked with high cliffs. The advanced force was in the "Euryalus" with boat tows to take it ashore; the "Swiftsure" was the covering ship. The beach was strongly defended and the Lancashire Fusiliers had a terrible time. V Beach, just under the castle, became a place of despair. The old collier "River Clyde" full of troops was run ashore with a bridge of lighters to carry the men ashore. The lighters broke adrift, though Comm. Edward Unwin and three gallant companions (all four awarded the V.C.) made desperate attempts to get them into place, and the landing broke down entirely. At S Beach the troops were landed in trawlers, which were run aground under a heavy fire from the "Cornwallis" and "Lord Nelson," and the 2nd South Wales Borderers got ashore with very few casualties. Such was the landing at Helles, which, as a feat of arms, ranks high in the annals of the British army (*see DARDANELLES CAMPAIGN*).

*Resignation of Lord Fisher and Mr. Churchill.*—But another danger was looming on the horizon. Otto Hersing, one of the most skilful German commanders, was on his way out in U21. On May 13, too, the "Goliath," anchored in Morto Bay just inside the entrance, was attacked at 1:15 A.M. by a destroyer, the "Muavenet-i-Millet," with a German commander, and hit by three torpedoes, sinking in a few minutes with a loss of over 500 men. Lord Fisher insisted on the recall of the "Queen Elizabeth" but in the attitude of the War Council and the First Lord on May 14 he saw his great alternative scheme in the Baltic doomed. On May 15 he walked out of the Admiralty, precipitating a political crisis which swept the First Lord from Whitehall; Mr. Balfour took his place and Adml. Sir Henry Jackson became First Sea Lord. On May 25 Otto Hersing arrived at the Dardanelles. At 12:25 P.M. he torpedoed the "Triumph," which capsized in 10 minutes, with the loss of three officers and 70 men. On the 27th at 6:45 A.M. the "Majestic" suffered the same fate, with the loss of only 40 men.

The battleships had to be replaced by monitors and by old cruisers of the "Theseus" class which had been fitted with bulges, but the fleet still maintained the army's supplies by sea and remained its "father and mother" right up to the amazing night of Jan. 8 1916, when swiftly and silently it gathered into its arms the men of those tremendous legions and bore them home. But the passage of the Dardanelles, impenetrable to big ships, had been made by submarines. Nine British and three French submarines passed the Straits, of which three French and four British never returned. It was on this hazardous service that Lt.-Comm. Norman Holbrook in B11, Lt.-Comm. E. C. Boyle in E14 and Lt.-Comm. M. E. Nasmith in E11 won the V.C. Here too E15 (Lt.-Comm. T. S. Brodie), AE2 (Lt.-Comm. H. H. Stoker), E7 (Lt.-Comm. A. D. Cochrane) and E20 (Lt.-Comm. C. H. Warren) were lost and E12 (Lt.-Comm. Kenneth Bruce) on Oct. 25 got entangled in a net, but with her conning-tower flooded and under a hot fire won through in safety. From July 1915 to the end of the year there were usually two British submarines working in the Sea of Marmora, seriously interfering with the Turkish transports and supplies.

The end of the year saw the great crusade setting in a cloud of glory and stormy disappointment. It had in it the elements of a striking success, but there was no real staff at the Admiralty or War Office; France and the Grand Fleet were insistently calling, and Lord Fisher was wedded to his plan of attack in the Baltic, a still more dangerous enterprise, where German granite would have to be bitten instead of Gallipoli sand. In that sea, as at the Dardanelles, British assistance was limited to submarines, which did excellent work after their kind, but could do no more. The Sound was not passable to big ships, and Germany, at the beginning of the War, had agreed with Denmark to close the Great Belt with mines.

*The Baltic.*—The defence of the Baltic had been left to the older German ships but the Russians proved themselves no mean antagonists. An attempt on June 28 1915 to land troops at Windau (Courland) to support the German army closing round Warsaw was frustrated by a swarm of Russian destroyers attacking the transports and driving them off, bringing the operation to an abrupt close. On July 2 Russian cruisers drove the German minelayer "Albatross" ashore at Ostergarn (Sweden) and the German armoured cruiser "Prinz Adalbert" (4 8-2-in., 10 6-in.) making for the spot was torpedoed and seriously damaged by the British submarine E9 (Comm. Max Horton). In Aug. 1915 a serious attempt was made to force the Gulf of Riga in order to support the German army's advance; a large part of the High Sea Fleet including eight dreadnoughts and four battle cruisers came round from the North Sea, but on Aug. 19, E1 (Comm. N. F. Laurence) torpedoed and seriously injured the battle cruiser "Moltke." Next day the operations were abandoned, all the High Sea Fleet ships were sent back, and there ensued in the Baltic a long period of only minor activity.

*Home Waters, 1915.*—In the North Sea during 1915 U29 (Weddingen) had been rammed by the "Dreadnought" about 70 m. from Scapa. German strategy took the shape of minelaying

sorties, in which light cruisers to lay the mines were escorted by battle cruisers and the battle fleet. Such were the sorties of March 29, April 17, April 22 and May 17, "one day out and one day back"—this was the strategical formula. The Grand Fleet, fully informed of German movements, came out and the High Sea Fleet returned to harbour. British minelayers were not idle and Von Pohl nearly ran his evasive fleet full tilt into minefields laid by the "Princess Margaret" and "Orvieto" on the German coast on May 8 and 10. British cruiser squadrons continued their sweeps down the North sea, and on June 20 1915 the 3rd Cruiser Squadron crossed the path of four German submarines lying in wait off the Forth. The "Roxburgh" was hit by U38 and had to go into dock.

Some three weeks later came the last echo of cruiser warfare. The "Königsberg" had been lurking in the Rufiji river since Sept. 1914, watched by the "Chatham" (Capt. S. R. Drury-Lowe). There, on July 11, she was bombarded by the monitors "Severn," "Mersey" and "Humber," under Capt. E. J. Fullerton. Fire was opened by the "Mersey" at 9,500 yards, hitting was established with the help of an aeroplane after the eighth salvo, and the last German cruiser afloat abroad was left a blazing wreck in an African jungle. A supply ship, the S.S. "Rubens," which had left Germany on Feb. 18 1915 with coal and munitions, had slipped safely through the blockade and reached the African coast, but Rear-Adml. George King-Hall, in the "Hyacinth," receiving exact intelligence of her, drove her into Tanga harbour (German East Africa) on April 14, where she was scuttled. The auxiliary cruiser "Meteor," fitted as a minelayer, had also slipped through the blockade on May 31 and laid mines off Archangel on the Russian route. On the night of Aug. 7-8 the same ship (Lt.-Comm. von Knorr) laid a large minefield of 380 mines off the Moray Firth, sinking the patrol vessel "Ramsey." Betraying her position by wireless, she was intercepted within 30 m. of Horn Reef on Aug. 9 by Commodores Tyrwhitt and Goodenough and was scuttled about 1 P.M. by her commander, who escaped in a Swedish vessel.

In Germany, the controversy on submarine warfare again had become acute. After the sinking of the S.S. "Arabic" on Aug. 19 1915, by U24, orders were issued that no passenger steamers were to be sunk without warning. Tirpitz again asked to resign. Adml. Bachmann, the chief of the naval staff, entered a protest against the decision and was relieved of his post. The commander-in-chief recalled his submarines and submarine activity in the Channel and to the westward ceased for a time.

The pressure of the blockade was by this time beginning to be severely felt in Germany (see BLOCKADE). In the north this work was performed by the 10th Cruiser Squadron, but the New Year of 1916 saw another German ship, the "Moewe," one of the most notable German raiders, slip through its weather-beaten lines and get safely to sea after laying a large minefield on the west side of the Orkneys, where the battleship, "King Edward VII." was lost on Jan. 5 1916.

#### IV. THE NORTH SEA

On Jan. 18 1916, Adml. von Pohl, the German commander-in-chief, who had been seriously injured in an accident, was relieved by Adml. Scheer, a strong believer in a more offensive strategy. One of his first measures was the dispatch of 33 destroyers to the Dogger Bank on Feb. 10 1916, where they attacked the 10th Sloop Flotilla of the Humber patrol and sank the "Arabis" sloop while minesweeping. The safe passage of the "Moewe" induced another raider, the "Greif" (4 5.9-in.) to try and get to sea. She was sighted on Feb. 29 some 90 m. north-east of the Shetlands and the "Alcantara" (Capt. Thomas Wardle) of the 10th Cruiser Squadron got within 6,000 yards of her at 9:15 A.M. and ordered her to stop. An action ensued in which the "Greif" was sunk, but the "Alcantara," hit by a torpedo, went down as well. Two days later, in the night of March 2, the "Moewe" slipped through the patrol line and reached home on the 4th. Her cruise in mid-Atlantic in the region of flying fish had been very successful. She had captured 15 ships of 57,835 tons, of which the most important was the

"Appano" (Jan. 15), an Elder Dempster liner of 7,781 tons, with the governor of Sierra Leone and a cargo worth £2,000,000 on board. Sent, however, to Newport News as a German prize, the "Appano" was released by the U.S. Supreme Court in March 1917, on the plea that she had been sent in with the intention of being laid up indefinitely.

In March Von Tirpitz and the German naval staff had pressed for the commencement of unrestricted submarine warfare, but the Chancellor's view again prevailed and Von Tirpitz's resignation, offered for the third time, was finally accepted.

On March 24 1916 Tyrwhitt in the "Cleopatra," with five light cruisers and 18 destroyers, escorted the "Vindex" with five aeroplanes to attack the Zeppelin sheds at Tondern. Beatty's battle cruisers were supporting the advance. The aeroplanes did little and only two returned, but a situation developed not unlike that of Aug. 28 1914 at Heligoland Bight (*q.v.*), for the destroyer "Laverock" rammed the "Medusa," which had to be abandoned on the 25th. The German destroyers pushed out that evening, and during the night the "Cleopatra" (Tyrwhitt's flagship, Capt. F. P. Loder-Symonds) rammed and sank G194, but was herself rammed by the "Undaunted," whose speed was reduced to six knots. Scheer, with his fleet on March 26, was coming westward in pursuit, and Beatty, coming down from the north to cover the light cruisers, was 80 m. from the German battle cruisers when Scheer turned back at 7 A.M. The aircraft dropped one bomb in Denmark.

**Bombardment of Lowestoft.**—The end of April 1916 was full of events. Sir Roger Casement was landed by U19 at Tralee on the 20th to take part in the Irish rising, and the "Libau," a small ship disguised as the Norwegian S.S. "Aud," with a cargo of 25,000 rifles, 10 machine guns and ammunition for the Irish, was captured on the Irish coast by the sloop "Bluebell," only to be scuttled off Queenstown. On April 24 a large barrage of mines and nets was laid by Adml. Sir Reginald Bacon and the Dover patrol off the Belgian coast, and the same night Scheer struck a blow at the east coast.

The whole High Sea Fleet with 17 dreadnoughts and five battle cruisers left harbour by 2 P.M., April 24. At the very start it received a nasty blow when the battle cruiser "Seydlitz" at 2:45 P.M. struck one of the mines laid by the "Princess Margaret" in Nov. 1915. The Admiralty had the usual intelligence that the High Sea Fleet was out, and by midnight Jellicoe with the battle fleet had left Scapa and Beatty with the battle cruisers had left the Forth. All night long bombs were falling from the German Zeppelins on the east coast, and at 4:11 A.M. Boedicker, with his four battle cruisers (Hipper was ill), bombarded Lowestoft, destroying some 200 houses, and opened fire on Yarmouth at 4:24 A.M. Tyrwhitt had left Harwich at midnight with the light cruisers "Conquest," "Cleopatra," "Penelope" and nine destroyers. He pushed up the coast, and engaged the light cruisers "Rostock" and "Elbing" off Lowestoft at 4:30 A.M. The German battle cruisers came down on him and engaging him at 4:49 A.M. sent five 12-in. shells into the "Conquest," killing and wounding 40 officers and men, then made off hurriedly at 4:56 A.M. Tyrwhitt followed till 9:25 A.M. (April 25), when he was ordered to return, and on the way back the "Penelope" was torpedoed by UB29 and her rudder blown off. Beatty was now striking down towards Terschelling, but was still 50 m. off when Boedicker reached the Bight and got behind the German minefields, and the Admiralty sent out his recall at 12:30 P.M. Six submarines (E55, E29, E26, E22, D4, D6) had been sent out from Harwich with the destroyer "Melampus," by Capt. A. W. Waistell, Capt. (S), and just missed by four miles the German battle cruisers flying homewards. In these operations the German submarine UB13 was lost, and the British submarine E22 (Lt. Reg. Thos. Dimsdale) torpedoed and sunk by UB18 at 11:40 A.M.

To strengthen the position in the south, it was decided to station the 3rd Battle Squadron (seven "King Edwards") in the Thames, and it sailed for Sheerness on April 29. On May 5 1916 Jellicoe launched another air attack against the Zeppelin sheds at Tondern. Two minefields were laid at the same time

in the Bight, one off Horn Reefs by the minelaying destroyer "Abdiel" (Comm. Berwick Curtis), the other off Borkum by the "Princess Margaret" (Comm. Lockhart Leith). The Grand Fleet put to sea in support. The 1st Light Cruiser Squadron escorting the "Vindex" and "Engadine" with nine sea-planes was off Sylt at 3 A.M., May 4. The sea-planes would not rise, and only one got away, but the "Galatea" and "Phaeton" damaged Zeppelin L7. She came down near E31, which completed her destruction.

**The Battle of Jutland.**—On April 24 Scheer, as he returned from Lowestoft, had received an order that submarines were not to sink merchant ships without warning and examination. He immediately recalled all the High Sea Fleet submarines from the war against commerce, and set to work to devise a scheme for enticing the British Fleet out. Twenty-two submarines were to be stationed off the British ports, the High Sea Fleet was then to appear off the coast of England or Norway, in the hope that the Grand Fleet would rush out in pursuit and meet the German submarines. Such was the plan of the Jutland operations. It did not develop "according to plan." The submarines, 14 in number, were off the British coast by May 23, but weather delayed the sailing of the High Sea Fleet till May 30. The German battle cruisers left the Jade at 2 A.M. followed by the battle fleet. It met the British battle fleet on May 31. There followed the battle of Jutland (*see* JUTLAND, BATTLE OF). The British lost three battle cruisers, three armoured cruisers and eight destroyers, 6,094 killed, including two rear admirals, 674 wounded and 177 prisoners. The Germans lost one older battleship, one battle cruiser, four light cruisers and five destroyers, 2,551 killed and 507 wounded. Scheer, threatened with envelopment, made good his escape and the High Sea Fleet remained intact, to guard the Bight, to ensure the safe entry and exit of submarines and to compel the British to keep a mass of craft locked up in the Grand Fleet when they were wanted for convoys and the tremendous struggle against the submarine.

The German submarines achieved a single belated success. U75 had laid mines on the west side of the Orkneys on May 29 and on June 5 the "Hampshire" on her way to Archangel struck one of them and went down, bringing Lord Kitchener's mission and great career to a sudden end. A gale had been blowing from the northeast that afternoon, but Lord Kitchener at Scapa insisted on sailing. To give the "Hampshire" a lee she was sent up the west side of the Orkneys and sailed at 5:30 P.M., but the wind backed to N.N.W., and the destroyers escorting her, unable to face the gale, had to put back. About 7:50 P.M. she struck a mine, 1½ m. from shore between the Brough of Birsay and Marwick Head and sank in 15 minutes with the loss of all but 12 men.

**Scheer's Renewed Attempt.**—In Aug. Scheer renewed his efforts. This time the submarines, instead of being off the ports, were disposed in lines in the North Sea on the expected track of the British Fleet. The High Sea Fleet put to sea in the evening of Aug. 18 with the intention of bombarding Sunderland at sunset the next day. The new battleship "Bayern" and the "Grosser Kurfürst" and "Markgraf" were attached to the battle cruisers of the 1st scouting group in place of the "Derfflinger" and "Seydlitz," which were still under repair. The battle fleet with eight Zeppelins followed only 20 m. behind. E23 was waiting for them on the way across and put two torpedoes into the dreadnought "Westfalen," forcing her to return. Directionals and intercepts supplied ample intelligence of the German movements and Jellicoe had put to sea with the Grand Fleet at 5 P.M. on Aug. 18. He was on his way down the east coast with the battle cruisers 30 m. ahead when the 2nd Light Cruiser Squadron ran into the first line of German submarines in the latitude of Farne Islands at 5:55 A.M. on Aug. 19, and the "Nottingham," going 20 knots, was struck by two torpedoes from U52. Jellicoe turned and made to the northward for a time. The "Nottingham," badly damaged, was hit by a third torpedo at 7 A.M. and sank.

Meanwhile the Harwich force made towards the enemy, while Scheer held steadily on, receiving a stream of reports from his

Zeppelins, submarines and the German intercept station at Neumünster which enabled him to locate the British forces. Jellicoe at noon was some 100 m. east of the Farne Islands, steering down the coast, with Beatty's battle cruisers ahead of him while the German Fleet about 100 m. east of Whitby was steering to the west on a converging course. At 12:30 Beatty's battle cruisers with battle flags hoisted were abreast of New-castle, only 42 m. from the German Fleet, when Scheer turned to the southward and made a push against the Harwich forces. He turned for home at 2:35 P.M., and Jellicoe, thinking it unwise to follow on account of the submarines, directed Beatty to turn back at 4 P.M., but at 3:20 P.M., on receiving another report of a submarine, ordered him to turn at once. At 4:52 P.M., while returning, the "Falmouth" of the 3rd Light Cruiser Squadron, going 23 knots, was hit by two torpedoes from U66. On Aug. 20 at noon U63 sent two more torpedoes into her and she sank off Flamborough Head. The Harwich flotillas kept in touch with Scheer till 7:30 P.M., but without the support of the Grand Fleet could not press home an attack. Scheer regarded this as a very successful operation, and intended to repeat it, but in Oct. his submarines were ordered to resume their war on merchant ships and were no longer available for fleet operations.

The resumption of the submarine campaign called for a clear passage down the Channel, where a barrage of mines and nets had been laid by Adml. Bacon in April 1916, extending from the South Goodwins towards Dunkirk. This was patrolled by a force of 23 drifters and the German 3rd and 9th Flotillas were sent round to Zeebrugge for the special purpose of raiding it. Intelligence of their arrival had been received and the vice-admiral at Dover distributed his destroyers to meet an attack—four in the Downs, eight at Dunkirk and six at Dover. The night of Oct. 26 was dark and the German destroyers attacked in two divisions of five and six boats. The destroyer "Flirt" on patrol was sunk with all hands at 11 P.M. The destroyers at Dover, Dunkirk and in the Downs put to sea. The "Nubian" sighted the Germans, challenged them and was torpedoed in reply (12:40 A.M.); the enemy disappeared in the night and got back to Zeebrugge, after sinking seven drifters and two destroyers. This was the first of a series of attacks on Dover intended to assist the passage of submarines. In the north the "Moewe" (Comm. Graf Nikolaus zu Dohna-Schodien) had got safely to sea again in the winter nights (Nov. 23-5) and was followed by another raider the "Wolf" (Capt. Karl Nerger) on Nov. 30.

Submarines were again engaged in their war on trade (see SUBMARINE CAMPAIGN) and on Nov. 5, when U30 and U20 ran ashore on the Danish coast in a fog, Scheer sent out a half flotilla of destroyers supported by the "Moltke" and the 3rd Squadron of battleships to get them off. J1 (Comm. N. F. Laurence) was there as well and torpedoed the battleships "Grosser Kurfürst" and "Kronprinz," driving them both back to harbour. The Kaiser remonstrated with Scheer for risking battleships in this work, but Scheer maintained that the fleet's principal task at this stage of the War was to secure the safety of the submarines passing in and out.

#### V. THE SUBMARINE WAR, 1917-8

The peril of the submarine was now growing more and more acute, and on Nov. 29 1916 Adml. Sir John Jellicoe left the fleet to take the post of First Sea Lord of the Admiralty and Adml. Sir David Beatty succeeded him as commander-in-chief of the Grand Fleet. Unrestricted submarine warfare (that is sinking at sight without warning) was being urged by both the army and navy in Germany. The Chancellor's opposition was overcome, and on Jan. 9 1917 an Imperial order went out to commence it on Feb. 1. The war at sea now became a war against the submarine and to assist the submarine.

*The Dover Raids.*—In the south the Harwich flotillas were kept constantly busy. Early in the morning of Jan. 23, the German 6th Flotilla of eight destroyers, trying to return from Zeebrugge to the Bight, was met by a Harwich force of three light cruisers and some 14 destroyers. It was a cold dark night and a general mêlée ensued. V69, the flotilla leader's boat, was

driven into Ijmuiden and S30 had to put back. The British destroyer "Simoon" was torpedoed and sunk. Feb. 1 saw the beginning of the momentous submarine campaign followed by the rupture between Germany and the United States. The principal concern of the German commanders was to maintain a safe passage for the submarines, and with this in view a series of raids was made on the Straits of Dover. On March 17 1917 the night was dark; the barrage patrol consisted of four destroyers patrolling on separate beats. Six more were lying in Deal, and the "Broke" and five others were in Dover. The "Paragon" on patrol sighted three or four destroyers at 10:50 P.M., challenged and was torpedoed in reply. The "Llewellyn," thinking she had struck a mine, went to help her and was torpedoed at 11:15 but got back to Dover. The Germans then disappeared into the night. While these events were happening, the "Moewe" had slipped through the blockade and got back to Kiel on March 20 1917, after capturing 27 ships in the Atlantic. Another raider on the way out was not so fortunate. On March 17, at 4 P.M., the armoured cruiser "Achilles" (Capt. F. M. Leake) and the merchant cruiser "Dundee" (Comm. S. M. Day) intercepted the "Leopard" disguised as a Norwegian, northeast of the Faeroes and sent her to the bottom.

The night of April 20 saw another raid at Dover. The patrols had been reinforced. Two flotilla leaders, the "Broke" (Comm. E. R. Evans) and "Swift" (Comm. Ambrose Peck), were patrolling off the Goodwins, and a whole division of destroyers was on patrol in the Straits, with reserves at Dover and Deal. The German 2nd Flotilla attacked in two sections, one of which went off to the French, and the other hugged the English coast. The latter was on its way back and at 12:45 A.M. was off the Goodwins on an easterly course when it was sighted on the port bow by the "Swift" and "Broke," patrolling on an opposite course. There was no challenging. The "Swift" turned at once to port, fired a torpedo which probably hit G85, and dashed through the enemy's line. The "Broke" did the same and crashed into G42, the third boat in the line. A hand-to-hand fight ensued as the Germans attempted to board and were driven back, and the "Broke" then completed the destruction of G85. This was the famous little action of the "Swift" and "Broke" and except for two ineffective sorties on April 26 and May 2 put a stop to destroyer raids on Dover for nearly a year.

*United States at War with Germany.*—On April 6 the United States entered the War, and Vice-Adml. W. S. Sims was despatched to Europe to devise means of co-operating with the Allies. This was a black month for merchant shipping. The war at sea was developing into a protracted struggle with the submarine, while the battle fleets acted as shields, behind which the submarine and its antagonists fought out a bitter fight for supremacy. The baleful effect of Scheer's escape at Jutland was now severely felt. The High Sea Fleet stood guarding the roads for its submarines, and its menace compelled the Grand Fleet to retain for fleet use numbers of destroyers urgently required for the fight with the submarine. In this sphere the United States was able to afford invaluable assistance and United States destroyers, the first six of which, under Comm. J. K. Taussig, arrived at Queenstown on May 4 1917, helped to save the situation.

In the Mediterranean, the War was becoming more and more a war of flotillas. There the Straits of Otranto took the place of the Straits of Dover and a force of some 50 vessels, chiefly drifters, patrolled it to prevent the passage of submarines from their base at Cattaro. These little ships were attacked by a force of Austrian cruisers and destroyers on May 15 1917 and 14 drifters, which stoutly refused to surrender, were sunk. On the approach of the light cruisers "Dartmouth" (Capt. A. P. Addison) and "Bristol" the Austrians retired to Cattaro; the "Dartmouth" was torpedoed but got safely back.

At Dover since 1915, Adml. Bacon had been attacking the submarine by bombardments of their bases at Zeebrugge and Ostend, and these were continued in 1917 with the monitors "Lord Clive," "General Wolfe," "Prince Rupert" and "Prince Eugene" (2 12-in.) and the "Marshal Soult," "Erebus" and

"Terror" (2 15-in.). Zeebrugge was bombarded on May 12, and Ostend on June 5, and a number of heavy shells fell close to the basins, though the lock gates were not actually hit.

On July 9 the dreadnought "Vanguard" (Capt. I. M. Dick) was lost at Scapa by an internal explosion in the same terribly sudden way as the six other Allied ships which suffered this fate in the War—"Bulwark," Nov. 26 1914; "Benvenuto Brin," Sept. 27 1915; "Natal," Dec. 30 1915; "Leonardo da Vinci" (fire), Aug. 2 1916; "Tsukuba," Jan. 14 1917 and "Kawachi," July 12 1918.

The Plans Division recently constituted at the Admiralty was busy at this time with a project for mining Heligoland Bight, though its execution was delayed till Oct. 1917, by lack of mines. On Sept. 1 the 4th Light Cruiser Squadron and 15th Flotilla made a raid on the channel by Horn Reefs, driving four German

minesweepers ashore. These minesweepers working sometimes 150 m. from Heligoland sweeping the ways for the submarines were a natural target for attack, but as they were always supported by heavy ships, light cruiser attacks on them were not easy.

**German Capture of Osel.**—In the Baltic the Germans had been engaged in a big operation to assist their army. In Nov. 1916, they had tried to force the Gulf of Finland, but after the loss of seven destroyers on mines had abandoned it. In Sept. 1917, the capture of Riga by the army (Nov. 3) led to an attempt by the German navy to open up the Gulf of Riga.

To capture the defences it was decided to land a force of 23,000 men at Taga Bay in the north of the island of Osel which lies across the Gulf of Riga with the Straits of Irben on the south side between it and the mainland. Vice-Adml. Schmidt with the battle cruiser "Moltke," 10 of the latest dreadnoughts, eight light cruisers and 47 destroyers came round from the North Sea to perform the task. The fleet and transports sailed from Libau on Oct. 11 and the force was landed in Taga Bay by 5:30 A.M. on Oct. 12, though the "Bayern" and "Grosser

Kurfürst" both struck mines on entering the Bay. The Straits of Irben were swept, the Russian battleship "Slava" sunk and by Oct. 17 the Germans were in complete occupation of the island. Three of their battleships however had been attacked by British submarines, and on Oct. 29, when the dreadnought "Markgraf" struck a mine, orders came for the naval forces to be withdrawn. The operation is specially interesting as being somewhat similar to that of the Dardanelles, involving an attack on a minefield defended by heavy guns.

Symptoms of the spirit which was to end in Germany's collapse were already beginning to appear. Sporadic outbreaks of mutiny had occurred in the 3rd Squadron as early as May, 1917, and the "Kaiserin," "Kaiser" and "König Albert" had to be sent to Brunsbüttel for recreation and leave. The crew of the "Westfalen" too was disaffected, and the spirit and courage of the German Fleet were evidently beginning to flag.

The convoy system, which was one of the most effective replies to the submarine, was a natural target of attack, and on Oct. 17 1917, the Scandinavian convoy received a heavy blow. This convoy, sailing regularly from Lerwick to the Norwegian coast, was on its way to Lerwick, consisting of 12 ships (two British, one Dane, one Belgian, five Norwegian, three Swedish) with an escort of two destroyers, the "Strongbow" (Lt.-Comm. Edward Brooke) and "Mary Rose" (Lt.-Comm. Chas. L. Fox). It was about half way across (60° 26' N., 1° 16' E.) steaming eight knots about 6 A.M. on Oct. 17 when the "Brunner" and "Bremse" two fast new German cruisers, armed with four 5.9-in., were seen on the port side coming up at 25 knots. They opened fire and sank both the destroyers, with all hands (132 men), before they had even time to send out a wireless to the light cruiser squadron supporting them, and went off at 8:20 A.M. after sinking nine of the merchant ships without examination or warning of any kind. The armed trawler "Elise" got away but as she had no wireless, it was not till 7 P.M. that the Admiralty received the report. This attack led to a general revision of the arrangements for convoys and to the provision of stronger forces to cover them. The question of using the Grand Fleet, or portions of it, to cover convoys was a difficult one. The use of directionals had induced what may be called a policy of immediacy, in which the battle fleet with all its light craft had to be ready for immediate excursion, and could not always be available for the routine work of convoys.

Nov. 1917 was marked by Grand Fleet light cruiser raids in the Cattegat and Bight. The Cattegat had become more and more a sphere of German activity against British commerce. Minefields and guardships had long guarded the southern entrance to the Sound, ships proceeding to Sweden were constantly exposed to attack and decoy ships cruised in the Cattegat to attack British submarines. One of these was the "Kronprinz Wilhelm," which was cruising off Kullen Light on Nov. 2 at 7 A.M., when several British cruisers swept down on and sank her, with a very damping effect on German activity in this area.

**Engagement in the Bight.**—In the Bight the increase in British minelaying, which started in earnest about Oct. 1917, involved an enormous expansion in the German minesweeping service. As the minefields grew, the swept channels or "ways" grew longer and longer, and the minesweepers, working out at sea, had to be supported by light cruisers and battleships. An engagement on Nov. 17 1917 affords an interesting illustration of the part played by the German battleships in this respect. The German minesweepers that morning were making their test trip escorted by destroyers, covered by the light cruisers of the 2nd and 4th Scouting Groups and supported by the battleships "Kaiser" and "Kaiserin," when at 7 A.M. they were attacked by a British force consisting of the "Courageous" (Rear-Adml. T. D. Napier) and "Glorious" (Capt. Chas. B. Miller, 4 15-in. 30 knots), the "Renown" (Capt. Michael Hodges) and "Repulse" (Rear-Adml. R. F. Phillimore, 6 15-in., 30 knots), the 1st and 6th Light Cruiser Squadrons and a number of destroyers. The horizon was misty and an action developed at 12,000 yards with the German light cruisers running to the southeast raising a smoke screen to cover their minesweepers. At 8:50 A.M. the

British destroyers attacked the 2nd Scouting Group without success. The light-cruiser "Königsberg" had been hit by a heavy shell, when at 9:30 the "Kaiser" and "Kaiserin" came on the scene. The "Kaiserin" scored a hit, but on their arrival the British force withdrew, before the "Moltke" and "Hindenburg," which were hurrying to the spot, arrived. The Germans lost one outpost vessel, 21 killed and 21 wounded. On the British side the "Calypso" was hit and her captain (Capt. H. L. Edwards) killed. The engagement furnishes another illustration of the difficulty of opposing heavy guns on the edge of a minefield.

The attack on the German minesweepers was answered by another German thrust at the Scandinavian convoys made by the 4th Half Flotilla on Dec. 12 1917. At 11:30 A.M. about 35 m. from the coast of Norway an attack was made on a British convoy of six steamers escorted by the destroyers "Pellaw" (Lt.-Comm. Jas. Cavendish) and "Partridge" (Lt.-Comm. Reg. Ransome), which advanced boldly and engaged the five German destroyers at 5,000 yards. The "Partridge" was badly hit, but before sinking fired a torpedo, which hit *V100* but did not explode. The four armed trawlers were sunk. The "Pellaw" managed to escape in a squall of rain. The armoured cruisers "Minotaur" and "Shannon" heard the "Partridge's" call for assistance and steamed at full speed for the spot (59° 30' N., 4° E.), but by the time they arrived, all was over, and the German destroyers got safely back to Kiel with four officers and 71 men as prisoners. The raid led to the provision of stronger covering forces and to considerable changes in the Scandinavian convoy system which had almost broken down under these successive blows.

The Dutch convoy in the south suffered a little later an equally nasty blow of a different kind. Its escort was provided by the Harwich destroyers, and on Dec. 23 at 8 A.M. a few miles N. of the Maas light, they stumbled into a German minefield, where the "Torrent," "Surprise" and "Valkyrie" were all mined in quick succession and sank before they could reach the shore.

The year was drawing to a close but before it closed Adml. Sir John Jellicoe had left the Admiralty, and his place as First Sea Lord was taken by Adml. Sir Rosslyn Wemyss. The war at sea was expressing itself more and more in terms of the submarine. It was imperative to close the Straits of Dover to submarines and Rear-Adml. Sir Roger Keyes was sent to do it, and did it very effectually. In the next four months nine submarines were destroyed in the Dover area and the High Sea Fleet submarines ceased to use the Straits of Dover.

All this time the Black Sea had been the scene of sporadic warfare between Russian and Turco-German forces. Russia at the beginning of the War had possessed two pre-dreadnoughts, the "Ivestaf" and "Ivan Zlatoust" (1906, 4 12-in., 4 8-in., 12 6-in.), to pit against the "Goeben," and by the end of 1915 three dreadnoughts had been completed in these waters—the "Ekaterina II.," "Imperatriz Maria" and "Alexander III." (all 12 12-in.)—which gave her the control of the Black Sea and ensured her communications with the Caucasus. The collapse of Russia and the mutiny of the Black Sea Fleet may have led the "Goeben" (Sultan Selim) to look to the westward for, on Jan. 20 1918, she made a sortie from the Dardanelles. The British force in that area under Rear-Adml. Hayes Sadler consisted of the "Lord Nelson" (flag) and "Agammemnon," six old light cruisers, 12 monitors, seven sloops and 27 old destroyers. The "Lord Nelson" was at Salonika and the "Agammemnon" at Mudros. The destroyers "Tigress" (Lt. J. B. Newill) and "Lizard" (Lt. N. A. Ohlenschlager) were patrolling off the Straits and the monitors "Raglan" (Comm. Visct. Broome) and M28 (Lt.-Comm. Donald Macgregor) were anchored at Imbros, some 15 m. from the Straits. The "Goeben" and "Breslau" sallied out about 5 A.M. and made for Imbros shadowed by the "Tigress" and "Lizard." The "Raglan" sighted them at 5:35 and gave the alarm by wireless. She was engaged by the "Breslau," set on fire and sunk. M28 was set on fire and blew up with her captain at 6:27. The "Goeben" and "Bres-

lau" went off to the southward, but off the southeast point of Imbros the latter struck a mine at 7:07 A.M. and sank, leaving 40 survivors to be picked up by the "Tigress." The "Goeben" struck two mines about the same time and heading for the Straits beached herself off Nagara in the Narrows. In the course of the ensuing week more than 15 tons of bombs were dropped round her by aeroplanes with several hits, but the small 112 lb. bombs inflicted no vital damage. An heroic attempt to torpedo her was made by E14 (Lt.-Comm. M. Geoffrey White), which was sunk and her captain killed.

*The Last of the Dover Raids.*—In the North Sea the Dover barrage had been greatly strengthened. It consisted of 18 lines of deep mines, patrolled by a strong force of drifters and trawlers, with searchlights and enormous flares burning all night to discover submarines and force them to dive. The High Sea Fleet submarines no longer dared to pass there, and the German and Flotilla, numbering 11 of their best and fastest boats, was sent straight from the Bight to attack it on Feb. 15 1918. There were 58 drifters in the Straits that night, with a monitor M26 and four destroyers, while two destroyers were off the Goodwins, and the "Attentive" and three more were in the Downs. The Germans arrived in the Straits about 11:30 P.M. and one half flotilla made for Folkestone, the other for Gris Nez. The former set fire to a searchlight vessel, sank two drifters and disappeared without anyone firing the alarm—a green rocket. Flashes were seen and guns were heard, but they were thought to be ships on patrol firing on submarines. The other half flotilla set fire to a searchlight vessel and sank three drifters, but it was not till about 1 A.M. when the enemy were retiring that the alarm signal went up. The Germans got away after sinking seven drifters and one trawler.

They were not so fortunate a month later. On March 21 the destroyer "Botha" (Comm. Roger Rede, 2 4-7-in., 2 4-in.) and "Morris" (Lt.-Comm. P. R. Percival 3 4-in.) were lying with the French destroyers "Bouclier," "Capitaine Mehl" and "Magon" in Dunkirk when a burst of firing was heard at 3:30 in the morning. The destroyers slipped and passing through the Zuydcoote Pass, a narrow channel between Dunkirk and Ostend roads, sighted the German destroyers and came on two of their boats. The exploit of the "Broke" was repeated. The "Botha" rammed a German at full speed and cut it in half. Another was disabled by gunfire from the two boats. The "Botha" was torpedoed in the darkness by a friend, but the "Morris" chased the enemy into Ostend and on her return sank the disabled boat and took the "Botha" home in tow. This was the last of the long series of Dover raids.

The War had become a war of straits and passages, but it was not till 1918 that mines were laid in the Cattegat. In the early part of the War this had been a "no man's sea," but by 1917 German ships were regularly cruising there. The British sweep of Nov. 2 1917 had diminished their activity, but submarines had begun to use this route regularly whenever the Bight ways were blocked. In Feb. 1918 a deep minefield was laid off the Skaw to catch them and another on April 15 1918 off Laesö. This was laid by the "Princess Margaret" and "Angora," supported by ships of the 6th Light Cruiser Squadron and 13th Flotilla and escorted by the destroyers "Valentine" and "Vimiera," which sank 10 German trawlers off Anholt. The discovery of the mines apparently raised serious apprehension in German naval circles but the operation was not repeated.

*The Blocking of Zeebrugge.*—At Dover Rear-Adml. Roger Keyes was maturing a plan to supplement the closure of Dover Straits with the blocking of Zeebrugge and Ostend. This would seal up not only the Flanders submarines but the destroyers as well, which were a constant menace to the barrage and its patrols. The enterprise was a daring one, but it was carefully prepared and skillfully carried out on the night of April 22-3. The "Vindictive" (Capt. Alfred B. Carpenter) proceeded alongside Zeebrugge Mole to draw the fire from the three blocking ships, two of which achieved their object and the whole attack remains a great and inspiring example of careful planning and heroic execution. At Ostend the attempt miscarried and a second

attempt, made by the "Vindictive" on May 9, also failed (see ZEEBRUGGE).

As the "Vindictive" was returning from Zeebrugge the German Fleet was putting to sea on its last excursion for a big attack against the British Scandinavian convoys. The fleet left at 6 A.M. on April 23 with Hipper's battle cruisers ahead and 17 battleships and four flotillas behind. By the morning of the 24th Hipper's battle cruisers had reached the Norwegian coast, when the battle cruiser "Moltke" broke down and had to put back. By 7 A.M. when she was off Stavanger she could only go four knots and began to call for assistance; the battle fleet sighted her at 9:40 A.M. and she was taken in tow. Hipper meanwhile had run up as high as lat. 60° N., but saw nothing of the convoy. The fleet turned back with the "Moltke" in tow which was torpedoed by E42 (Lt. C. H. Allen) off Sylt at 6:50 P.M. but got safely home. It was a bad day for the excursion. The homeward bound convoy of 34 ships was approaching the Forth at 8 A.M. on the 24th, and the outward bound convoy had not left the river. The sortie was futile, but it led to an important conference held in the Forth on April 29 on the subject of convoys, where it was decided to shift the Scandinavian route to the northward of 61° North. Up to the moment too when the "Moltke" began to call for help, there had been none of the usual indications of the German Fleet being at sea. Submarine J4 had sighted it at 7 P.M. on April 23, but her report had not reached Beatty, and the disadvantage of relying too exclusively on directionals and wireless was clearly demonstrated. This was the last excursion made by the German Fleet, and ranks in importance with that of Jutland and Aug. 19 1916.

In the north a great effort was being made in conjunction with the United States to close the northern exit to submarines (see MINELAYING) and the Grand Fleet was largely occupied in escorting and covering the minelayers, just as the High Sea Fleet was busy in covering its minesweepers. One of the last important operations in the North Sea was another air attack on the Zeppelin sheds at Tondern near Sylt on July 19 1918. This was made by the aircraft carrier "Furious," an immense cruiser, similar to the "Courageous," which had been converted into an air carrier. She was supported by five battleships of the 1st Battle Squadron ("Repulse" class) and escorted by the 6th Light Cruiser Squadron and a number of destroyers. The attack, representative of the stage reached by air carriers at the end of the War was made by seven aeroplanes, each carrying two 65-lb. bombs. Six machines started and reached their destination, setting fire to a double Zeppelin shed which was burnt out. Two got safely back, one fell into the sea and three landed in Denmark and were interned. On Aug. 11 1918, a combined raid of aircraft and coastal motor boats—light boats going 35 knots and carrying two torpedoes—was carried out in the Bight. A Zeppelin L53 was brought down by the aircraft, but German aircraft swept down on the motor boats; three of which were sunk and three lost.

*The Mediterranean.*—In the Mediterranean, the Straits of Otranto, 40 m. wide, corresponded to the exits of the North Sea, and on Aug. 16 1914, were closed by the arrival of the French Fleet, based on Malta 300 m. away. The Austrians then had three dreadnoughts ("Viribus Unitis," "Tegethoff," "Prinz Eugen") to oppose to the French four ("Courbet," "Jean Bart," "Paris" and "France"). The torpedoing of the "Jean Bart" by the Austrian U12 on Dec. 21 1914 and the sinking of the armoured cruiser "Leon Gambetta" on April 26 1915, by the Austrian U5 compelled the French admiral to withdraw his battleships from the narrow waters of the Adriatic.

Italy's declaration of war against Austria on May 24 1915, gave the Allies eight Italian and French dreadnoughts to the Austrian three. The supreme command in the Mediterranean was nominally vested in the French commander-in-chief Adml. Boué de Lapeyrère, but Italy became responsible for the blockade of the Adriatic and her fleet there was reinforced by four old British battleships ("Queen," "London," "Implacable," "Prince of Wales") and four light cruisers ("Dublin," "Dartmouth," "Sapphire," "Amethyst"), 12 French destroyers and

seven French submarines. Her battleships were based on Tarento, and her cruisers and destroyers on Brindisi, and operations in the Adriatic consisted chiefly of cruiser raids. The "Dublin" was torpedoed and damaged on June 9 1915, and on July 18 1915, the Italian cruiser "Giuseppe Garibaldi" was torpedoed and sank.

On the coast of Syria in 1914 the cruisers "Minerva" and "Doris" (Capt. Frank Larken) had shelled Alexandretta on Dec. 17 1914, but on Feb. 2 1915, Adml. Dartige du Fournet was appointed to command on that coast and with the "St. Louis," "Doris" and two French armoured cruisers shelled Gaza and El'Arish in April 1915. Egypt was a separate command and there Vice-Adml. R. H. Peirse, in Feb. 1915, put up a stout defence of the Suez Canal assisted by two battleships the "Swiftsure" and "Ocean."

The year 1915 saw the Dardanelles campaign, the advent of German submarines and the beginnings of the Salonika expedition. When Serbia collapsed in Nov. 1915, the Serbian Army fell back on Albania. This led, on Dec. 29 1915, to a raid on their base at Durazzo by the Austrian cruiser "Helgoland" (9 3-9-in., 27 knots) and five destroyers, supported by an armoured cruiser "Kaiser Karl VI." One Austrian destroyer was mined and the "Helgoland" was chased and engaged by the "Dartmouth" (Capt. A. P. Addison), the "Weymouth" and an Italian cruiser the "Nino Bixio" and was severely damaged but got away. The end of the year saw the reinforcement of the East Mediterranean squadron by the battleships "Hibernia" (Rear-Adml. Sydney Fremantle), "Zealandia," "Albemarle" and "Russell." The Salonika campaign led to the occupation of Corfu on Jan. 11 1916, as a base for the Serbian Army and in the numerous complications with Greece which followed, the pressure exercised by the navies played a large part.

It was not till Aug. 28 1916, that Italy declared war on Germany, and in 1917 the Allies in the Mediterranean could muster 12 dreadnoughts against the Austrian four. But it was no longer solely a question of dreadnoughts, and the advent of the submarine, operating all over the Mediterranean, emphasised the disadvantages of separate commands. The necessity of a single authority for controlling the routes and for the protection of merchant shipping had to be recognised and Vice-Adml. Sir Somerset Gough-Calthorpe was appointed British commander-in-chief at Malta to perform this work. A system of convoys was introduced, and 14 Japanese destroyers which arrived in this year gave invaluable assistance in this work.

The great problem in the Mediterranean was to co-ordinate the work of the Allies and on Nov. 29 1917, it was decided to create an Allied Naval Council, of which Sir Eric Geddes was chairman, which helped matters very considerably. The centre of Mediterranean strategy was the Straits of Otranto. The Austrian dreadnoughts never ventured out, but it was very difficult to keep the submarines in, on account of the depth of water, about 500 fathoms, which precluded the use of mines. The net and drifter barrage placed there in Sept. 1915 was not very effective, and the efforts to make it so in 1917 and 1918 led to raids on it, like those at Dover. On May 15 1917 the Austrian cruiser "Helgoland" and two others attacked it and sank 14 drifters. The "Dartmouth" and "Bristol" chased them back to Cattaro, but the former was torpedoed and nearly sank. Another raid by Austrian destroyers took place on April 22 1918. On June 10 1918, the Austrians, spurred on by Germany, sent their dreadnoughts down to Cattaro to attack the barrage, but two of them were met by Comm. Luigi Rizzo with two tiny torpedo craft near Premuda Islands and the dreadnought "Szent Istvan" was torpedoed and sunk and the attack collapsed. The barrage at this time employed 35 destroyers, eight submarines, and 36 United States "chasers," with three or four score drifters. On the night of Oct. 31 1918, a little Italian motor boat entered Pola and sank another dreadnought, the "Viribus Unitis." On the Syrian coast, a naval force of French and British ships co-operated in the bombardment of Gaza and maintained Gen. Allenby's communications by sea from Egypt to Haifa, Beirut and Tripoli.

To meet the danger of the Russian dreadnought "Volnya" falling into German hands, the Aegean squadron had been strengthened by four French battleships and the dreadnoughts "Superb" and "Temeraire" from England. It was the "Superb," which flying the flag of Vice-Adml. Gough-Calthorpe led the Allied Squadrons up the Dardanelles on Nov. 12 1918.

**Mesopotamia.**—In three great river expeditions the navy played an important part; one up the Dvina in the icy waters of the White Sea; another up the Tigris in the deserts of Mesopotamia; and a third up the Duala in the swampy creeks of the Cameroons. In the first Mesopotamian campaign which ended with the investment of Kut on Dec. 2 1915, the naval force consisted of the sloops "Espiegle" (Comm. Wilfred Nunn, 6 4-in., 2 3-pdr.) and "Odin" (4 4-in., 4 6-pdr.), the Indian Marine paddleship "Laurence" (4 4-in., 4 6-pdr.) and three small armed vessels.

The principal base was at Basra 70 m. up the Shatt al 'Arab and accessible to ocean steamers drawing 19 feet. Above Basra the river was uncharted, but vessels of 11 ft. draught could get to Al Qurna, 40 m. farther up, a port of great importance, as the point of junction of the Tigris and Euphrates.

The flotilla hastened the retirement of the Turks from Basra and pushed on to Al Qurna, where it took part in the attack and capture of the town on Dec. 9 1914. From Al Qurna the sloops pushed up the Tigris, under Commodore Wilfred Nunn, as senior naval officer. The Turks were entrenched at Bahrán about six m. above Al Qurna. Gen. Townshend arrived in April and on May 31 1915 there followed the amphibious battle of Al Qurna, where Gen. Townshend was on board the "Espiegle," supported by the sloops "Clio" and "Odin." As the Turks retired, the flotilla followed hot on their heels, shelling the Turkish gunboat "Marmaris," and when the sloops were held up by their draft above Ezra's Tomb, Gen. Townshend and Commodore Nunn shifted to the "Comet," a small yacht (one 6-pdr., 3 3-pdr.), and pushed boldly on to 'Amāra where their arrival on June 2 1915 greatly disconcerted the Turks. The original object of the campaign had been to secure the head of the Persian Gulf, but there followed the advance to Kut 143 m. farther up, supported by the "Comet," the "Shaitan" and "Sumana" with 4 4-in. guns in horseboat. There followed the victory of Sept. 27-8 1915, eight miles from Kut; where Lt.-Comm. E. C. Cookson of the "Comet," senior naval officer at the time, was killed (and awarded a V.C.) gallantly trying to cut the wire hawser of a boom under fire.

The army was now in Kut 240 m. up the Tigris, and went on through the baking marshes towards Baghdad and the battle of Ctesiphon on Nov. 22 1915. The flotilla, consisting of the "Firefly" (1 4-in., 1 6-pdr.), "Comet" and two armed launches, was held up by heavy artillery, and could do little in the actual

battle, but did yeoman service in the retreat shepherding the army river craft. Kut was invested, and, in the first attempt to relieve it, a heroic attempt was made on April 24 1916, by Lt.-Comm. Chas. Cowley and Lt. H. O. Firman in the "Julnar" to get 270 tons of stores into the town, but the ship was held up by a wire, and they were both killed, being awarded the V.C.

Gen. Sir Stanley Maude's campaign brought with it a whole fleet of river craft, scores of barges and dozens of Lynch's river paddle steamers. Commodore Nunn's naval flotilla had been strongly reinforced and by this time consisted of three "Insect" class (2 6-in., 2 12-pdr.), five "Fly" class (1 4-in., 1 12-pdr., 1 3-pdr.) drawing 3½ to 4 feet. It advanced with the army reaching Kut on Feb. 24 1917, coming under a heavy fire at the Nahr Killak bend; where the "Mantis" and "Moth" suffered severely and the captains of both (Comm. Bernard Buxton and Lt.-Comm. Chas. Cartwright) were wounded. But the flotilla forced its way through and with its 6-in. guns converted the Turkish retreat into a rout. On March 11 1917 the British flag was hoisted at Baghdad.

**The White Sea, 1917-9.**—The expedition to Archangel and up the Dvina began only in 1918 and survived the War. The

closure of the Baltic and Black Sea to the Allies had enormously enhanced the importance of the Arctic route. There were two ports there, Murmansk in Kola Bay and Archangel, the former ice free, the latter accessible to ships of 24 ft. from July to October. From Lerwick in the Shetlands to Kola Bay was 1,152 m. and from Murmansk a railway was being built to Petrograd, though it was not completed till 1917. Archangel therefore remained the only port of entry on the Russian railway system, and direct telegraphic communication was established by a cable 1,427 m. long laid from Peterhead to Murmansk in Jan. 1915. In 1917, 600,000 tons of war stores had entered Archangel in addition to 600,000 tons of coal, which were left derelict when Russia collapsed in that year. The armoured cruiser "Cochrane" and the French cruiser "Admiral Aube" were then sent to reinforce the old battleship "Glory" at Murmansk, and in May 1918, when the Germans were in Finland, a force of 600 British and 2,000 other troops was dispatched to Archangel, and 1,500 British and 5,000 others to Murmansk. It was decided to occupy

Archangel and push on down to Vologda to join hands with General Koltchak's force, and the town was occupied with little resistance on Aug. 2 1918. General Poole then advanced up the railway, in conjunction with a flotilla moving up the Dvina. This consisted of two monitors M23 and M25, four Russian river gunboats, and two Russian motor launches under Capt. Ed. Altham. **Bereznitski**, 200 m. from Archangel, was reached on Sept. 3 1918, but by Oct. 19 the flotilla had to retire as the river froze. In March 1919, it was decided to withdraw all forces from North Russia. The flotilla then consisted of six monitors (M23, 25, 26, 27, 31, 33), four gunboats (2 6-in., 2 3-in., 6 maxims), four minesweepers and six motor boats. Then the decision was reversed and it was decided that Gen. Ironsides should push on up the river to Kotlas, 200 m. above Berenski. But the river in June was commencing to fall and hopes of going further fell with it. The flotilla dropped gradually down to Archangel blowing up M25 and M27 which had gone aground. By Sept. 27 1919 the evacuation was complete.

*The Cameroons.*—The primary object of the expedition to the Cameroons was to blockade the river and destroy the German wireless station at Duala. The work of the navy began on Aug. 23 1914, when Capt. Cyril Fuller in the cruiser "Cumberland" (14 6-in.) proceeded there and organised the small vessels of the Nigerian marine for river work. The gunboat "Dwarf" (Comm. F. E. Strong, 2 4-in., 4 12-pdr.) and the "Ivy," a small Nigerian steamer armed with 3-pdr. guns, did good service in clearing the creeks, and on Sept. 16 the "Nachtigall," a small armed German steamer, attacked the "Dwarf" and was sunk. By Sept. 22 the mouth of the river had been swept, and on Sept. 23 the cruiser "Challenger" (Capt. C. P. Beatty-Pownall, 11 6-in.) arrived with six transports, and drawing 19½ ft., succeeded in passing into the river. The British force then consisted of 54 officers, 1,859 natives, six guns and 1,000 carriers and a French contingent of another 2,000 men was expected from Dakar. On Sept. 27, when an attack on Duala was pending, the Germans blew up the wireless and surrendered the town. Eight vessels of the Woermann line and one of the Hamburg-American were captured in the river. To the flotilla fell the task of clearing the enemy from the tortuous creeks of the river and transporting the troops and on Oct. 14 Jabassi, 50 m. further up the river, was captured.

The "Cumberland" was recalled after the battle of Coronel, but Capt. Fuller remained to complete his work, and though the final surrender of the colony did not take place till Feb. 28 1916 it was virtually in our power by the end of 1914.

*East Africa and Tanga.*—Things did not go so happily in East Africa. Early in Aug. 1914, the German governor at Dar-es-Salaam had agreed to regard the ships there as British prizes, but when the boats of the "Goliath" and "Fox" entered the harbour on Nov. 28 1914 to disable their engines a heavy fire was opened on them. Comm. Peel Ritchie was severely wounded in bringing the boats out of harbour and won a Victoria Cross. Far inland on Lake Tanganyika two motor launches the "Mimi" and "Toutou" arrived in Dec. 1915, and after an action with the German craft secured British communication there. They were under Comm. Spicer Simson, who had brought them all the way from the Cape by land a long journey of 2,000 miles. Early in 1916, another German ship managed to evade the blockade in the North Sea and in March slipped into Sudi in the south of the colony with an invaluable cargo of stores and munitions for Von Lettow-Vorbeck, the German military commander, which enabled him to continue the campaign. The coastline remained in German hands till June 1916, when Tanga was occupied by the cruisers "Talbot" and "Seyn"; Bagomoyo was occupied by the "Vengeance" and the cruiser "Challenger" on Aug. 15 1916, and by the end of Sept., Rear-Adml. Edward Charlton with his flag in the "Vengeance" could report the whole coast in British hands. But in the interior fighting dragged on till the Armistice.

Another raider got home in 1918. The "Wolf" (Capt. Karl Nerger) an armed steamer (7 5.9-in., 4 torpedo tubes and mines) carrying a small plane for reconnaissance had sailed on Nov. 30 1916, passed down the Atlantic, laid mines off Cape Town, and

Colombo, cruised in the Indian Ocean, passed on to New Zealand, returned by Fiji to Singapore, and finally arrived home in Feb. 1918, after a cruise of 451 days. She captured 13 ships and her mines laid off Capetown, New Zealand and Singapore, were responsible for 15 more. The first news of her came from a bottle thrown overboard in the Celebes by a prisoner. In Sept. 1918 there came news of the last German raider, the "Seeadler" (Capt. von Luckner) which left Bremen in Dec. 1916, and slipped through the blockade disguised as a Norwegian timber ship. Armed with two 4-in. guns and manned by 60 men, she had cruised off South America and sunk six British ships, and then rounding Cape Horn had disappeared into the Pacific. In the Society Islands off Mopihaa, a small atoll, she dragged on to a reef and broke her back. Out of six attempts by German raiders to pass the blockade, four were successful. Their cruises were unstained by any of the incidents which marred the German submarine campaign and may rank, with the cruise of the "Emden" and "Karlsruhe," among the brightest exploits of the German navy in the War.

## VI. THE END

The War was now drawing to a close. In July 1918 Adml. Scheer was summoned to Imperial Headquarters and on Aug. 11 was appointed Chief-of-the Staff, von Hipper succeeding him as commander-in-chief. Under the hammers of Foch and Haig the German front was breaking up. On Sept. 18, Scheer was told to be ready to leave the Flanders coast. On Sept. 29, the Bulgarian front collapsed, and on Oct. 5 Germany was forced to her knees. Immense explosions heralded the evacuation of the Belgian coast. On Oct. 17 the German troops left Ostend and two days later were in full retreat from Zeebrugge. Eleven destroyers and nine torpedo boats succeeded in reaching the Bight. The four submarines left there were blown up. Scheer wished to continue the warfare on commerce to the bitter end but on Oct. 21, the submarines at sea received orders to cease the campaign and return home. He then set to work to plan a great sortie of the High Sea Fleet. The submarines were ordered to assemble on Oct. 22 off the Scottish coast. A last great raid was to be made on the Channel while the submarines attacked the Grand Fleet on its way down. They were to be assisted by a large minefield laid off the Forth, which unknown to Scheer had been swept up as soon as it was laid. The plan was not to be fulfilled. Scheer saw the weapon he trusted break in his hands. On Oct. 29 the signal was made to prepare for sea; a great clamour arose and a mutiny broke out which compelled Von Hipper to abandon his project. The flotillas and submarines remained true and the commodore of submarines with 16 boats took refuge in Sylt on Nov. 8. But the end was near. Revolution was flaming everywhere. The troops were disloyal, the navy passed out of the admiral's hands. The War was over.

*Surrender of the German Fleet.*—Under the terms of the Armistice, 10 German battleships, six battle cruisers, eight light cruisers, 50 destroyers and all submarines were to be surrendered. On Friday Nov. 15, Rear-Adml. Hugo von Meurer arrived in the "Königsberg" in the Forth to make the final arrangements with Adml. Beatty. On Wednesday Nov. 20 a long line of submarines began their dolorous journey to Harwich where they were met by Rear-Adml. Sir Reginald Tyrwhitt with his flotillas 35 m. from the Essex coast. They passed into Harwich in dead silence. Not a sound arose from the vast crowds watching them on shore and sea. A total of 129 passed into Tyrwhitt's hands (57U, 49UB, 23UC).

On Nov. 21 the battleships of Germany's proud navy were surrendered to Adml. Beatty. It was a misty day and the Grand Fleet, cleared for action, steamed slowly down the Forth for the last time in two long lines six miles apart. The light cruiser "Cardiff" led the ships of Germany (nine battleships, five battle cruisers, seven light cruisers) up the lines. Beatty stood on the bridge of the "Queen Elizabeth," and as the "Seydlitz," heading the German ships, came abreast of her, the whole British line turned, enclosing the German ships in a serried avenue of steel.

The naval conditions of the Peace terms signed in June 1919, comprised 17 articles and laid down that the German navy was not to exceed six battleships of a pre-dreadnought type, six light cruisers, 12 destroyers and 12 torpedo boats, and was not to include submarines. Within two months of signature the eight dreadnoughts still in German hands ("Oldenburg," "Thuringen," "Ostfriesland," "Helgoland," "Posen," "Westfalen," "Rheinland," "Nassau"), eight light cruisers, 42 of the latest destroyers and 50 of the latest torpedo boats were to be surrendered, disarmed but with all guns on board. At the expiration of one month all German submarines building were to be handed over; such as could move or be towed were to be taken to Allied ports, the remainder were to be broken up. Units were only to be replaced in the case of battleships at the end of 20 years, in the case of destroyers at the end of 15. The personnel, including reserves of the fleet and coast defences, was not to exceed 15,000 officers and men.

The disposal of the German ships gave rise to lively argument. Great Britain wanted to destroy them all, France to add her share to her fleet. The question was complicated by the Germans scuttling most of their ships at Scapa on June 21. There were interned there 11 battleships ("Baden," "Bayern," "Friedrich der Grosse," "Grosser Kurfürst," "Kaiser," "Kaiserin," "Kronprinz Wilhelm," "Markgraf," "Prinzregent Luitpold," "König," "König Albert"), five battle cruisers ("Seydlitz," "Moltke," "Von der Tann," "Hindenburg," "Derfflinger"), eight light cruisers ("Emden," "Frankfurt," "Nürnberg," "Cöln," "Dresden," "Karlsruhe," "Brummer," "Bremse") when on a signal made at 10 A.M. by Rear-Adml. von Reuter from the "Emden," the ships were scuttled and began to sink. Only four were saved—the "Baden," "Emden," "Frankfurt" and "Nürnberg." Germany gained little by this act. She had to hand over, in default of the battleships, 300,000 tons of floating docks; her remaining light cruisers ("Graudenz," "Königsberg," "Pillau," "Regensburg," "Strassburg") in place of the cruisers; and 42,000 tons of floating cranes, tugs and dredgers instead of the destroyers.

The terms of peace were no mere formality. The destruction of the submarines and vessels building was entrusted to a naval section of the Inter-Allied Commission under Vice-Adml. Sir Montague Browning (subsequently under Vice-Adml. Sir Edward Charlton) and was strictly executed. The fortifications of Heligoland were razed and its guns broken up. The destruction of Germany's sea power was complete. It had been achieved by economic pressure and the imminence of military defeat based on command of the sea. The year 1920, which was to have seen the consummation of Germany's Navy Law of 1900 embodied in a great fleet of 61 capital ships, 40 cruisers and 144 destroyers, saw the whole fabric of her naval aspirations shattered, her proud fleet lying at the bottom of a desolate harbour, her Emperor, who had inspired its creation, a fugitive in a foreign land.

*Superiority of the Allies.*—The fleets of the Allied and Associated Powers covered every sea and their immense superiority is shown in the following figures:—

|                     | Dread-noughts | Battle Cruisers | Light Cruisers | T.B.D. | Subm. |
|---------------------|---------------|-----------------|----------------|--------|-------|
| Allied Powers       | 64            | 16              | 138            | 477    | 356   |
| Germany and Austria | 21            | 6               | 41             | 134    | 239   |

The Grand Fleet had grown to double its size in 1914. It mustered with Rear-Adml. Rodman's 6th Battle Squadron ("New York," "Texas," "Wyoming," "Florida," "Arkansas") 38 battleships, making with Rear-Adml. T. S. Rodgers' squadron at Berehaven ("Nevada," "Okloham" and "Utah"), which came over specially to anticipate any sudden sortie of the German Fleet at the end, a total of 41 battleships in British waters. The battle cruisers numbered nine. Its single light cruiser squadron had become seven; its two destroyer flotillas had increased to eight (3rd, 11th, 12th, 13th, 14th, 15th, 20th, 21st), mustering 167 destroyers, and its five submarine flotillas (10th, 11th, 12th, 13th, 14th) numbered 48 submarines.

And this represented only a portion of its activities. Round the coast an enormous organisation had grown up under the name of the Auxiliary Patrol for keeping the sea approaches clear of mines and secure against submarines. It comprised craft of all sorts and sizes, chiefly trawlers and drifters with a considerable sprinkling of yachts and motor launches. This motley collection of vessels running into thousands, manned by fishermen, yachtmen, officers of the Merchant Navy and men of the Royal Naval Volunteer Reserve, became a great disciplined force which bore no small share of the burden and heat of the day and played an important part in the struggle with the submarine (see SUBMARINE CAMPAIGN). It formed in reality a great Auxiliary Navy on duty round the coast and at the Dardanelles, at Otranto, and at Dover worked strenuously and fought valiantly to the last. The whole coastline of these islands was divided into 21 sections and in each section a number of these auxiliary vessels was constantly at work, each in its particular way. Thus Immingham (Humber), Yarmouth, and Lowestoft were pre-eminently minesweeping bases, which ensured the safety of the swept channel, called the War Channel, up the east coast. Queenstown (Adml. Sir Lewis Bayly) became one of the principal bases for escorts for the Atlantic convoys. There was stationed in 1918 a United States force of 37 destroyers and seven submarines and more than 40 other smaller craft. Buncrana with 30 destroyers and 33 smaller craft performed the same work on the north of Ireland route. At Larne again the work was chiefly directed to securing the North Channel and the Liverpool approach against the submarine, performed by four destroyers, 38 trawlers, 55 drifters and 15 other craft. At Granton (Adml. James Startin) in the Firth of Forth, over 100 trawlers were engaged in patrolling, and the convoy of Scandinavian ships to the Tyne and Humber absorbed six destroyers and 30 trawlers. As the War went on and on, the Merchant Navy and the Navy Royal became more and more a single force, ensuring the safe passage of the soldiers and the nation's daily bread.

*British Losses.*—The British losses had not been small. They amounted to 254 war vessels of which the greatest number fell to enemy submarines.

#### British Warship Losses

| Armed Merchant Cruisers | 1  | 11 | 1  | .. | .. | .. | .. | 2  | .. | 2  | 17    | 179,169               |
| Armed Boarding Steamers | 1  | 9  | 1  | .. | .. | .. | 1  | 1  | .. | .. | 13    | 23,799                |
| Coastal Motor Boats     | 5  | .. | .. | 2  | .. | .. | 2  | .. | 3  | 1  | 13    | 85                    |

Of auxiliary craft 815 were sunk, including 246 trawlers, 244 colliers, 130 drifters, 44 oilers, 24 motor launches and 18 mine-

sweepers. Of this total 289 (35.4%) were sunk by submarines, 225 (27.7%) by mines and 77 (9.4%) by wreck and stranding. The losses of the other Allies were not so heavy in comparison.

*Comparative Naval Losses*  
(to Nov. 11 1918.)

| Naval Losses                      | Dread-noughts | Pre-drs. | B. Cs. | Cr. | L. Cs. | Destroy-ers. | Sub-marines |

Though these figures give a merely statistical picture of the colossal ramifications of the War, they leave ample room for comment. The submarine inflicted and suffered most of the damage done in the War. It was the most active and the most dangerous service, and it was the German submarine that in 1917 became our worst menace. In the North Sea, Great Britain and the United States maintained a force of 46 capital ships (battleships and battle cruisers) against the German 23, in numbers a twofold, in gun power a threefold superiority. In the Mediterranean, France and Italy could muster 12 dreadnoughts against Austria's scanty three. These battleships were the shields behind which the other forces worked.

*The Effect of Sea Power.*—The work wrought by sea power, envisaged as a whole, he who runs may read. German trade was swept from the sea, the oceans were kept open for the troops and trade of the Allies and the shores of Great Britain and France and all the Dominions were never once threatened with invasion. In the Far East the fleet of our ally Japan drove Von Spee from Germany's only base and then, closing up behind him, barred the sea to his return. It may be said that the seas were not barred to the German submarine, but the answer is that the submarine merely attempted to do laboriously and slowly what a couple of battle cruisers appearing unopposed in the Channel could have done at once. And though the submarine was powerful against merchant shipping it accomplished much less against the fleet. Not a single dreadnought was sunk by it during the War and it was only in narrow waters like the Adriatic that it became a pressing danger to the fleet. It was countered by anti-submarine measures and convoys, working under the aegis of the battle fleet, which except in the case of sudden raids, like those on Dover, preserved them immune from attack. The fact that there was no great decisive battle has made some doubt the utility of the battleship. It is true that the opportunity which escaped the British fleet at Jutland was never wholly redeemed. If a battle is merely an incident in a blockade then its end may be achieved when the enemy retires to harbour. But if a battle represents the economy of the decisive blow, if the enemy's fleet can remain intact to play an important part in the campaign, then nothing can take the place of decisive battle. The fact that the battle fleet was never able to get to grips with the enemy does not diminish the importance of the battleship nor the importance of battle. It meant that vast resources of personnel and material had to be kept locked up in the Grand Fleet which a decisive victory would have released for the war against the submarine.

No surface ship was sunk by aircraft, but the end of the War left large possibilities still on the horizon, such as the use of aircraft on a large scale with a fleet. The power of the mine remains one of the lessons of the War and the combination of a minefield, supported by heavy guns either afloat (as in the Bight) or ashore (as at the Dardanelles) remains a very difficult proposition, for the mines offer an insuperable obstacle to heavy ships approaching, and the guns are able to prevent minesweepers approaching the

mines. The paravane offered only an uncertain solution to the problem which can only be solved in its entirety by destroying the heavy guns or by capturing the forts, as the Germans did at Ösel (Saaremaa) in 1917, but even there three dreadnoughts were severely damaged by mines. The mine must not be regarded as a merely defensive weapon. It is an immobile weapon but it can be very offensive, and in the Bight, and the Dardanelles, proved more than a match for the stronger fleet.

Certain other outstanding lessons remain as the fruit of our experience in the War. Invasion or landing on a large scale becomes more hazardous than ever, if it is opposed by submarines and large and powerful aircraft, while aircraft carriers laden with opposing aircraft are necessarily vessels of the largest size and offer an enormous target to attack. The interception of wireless signals and the location of ships by means of wireless directionals played a large part in the intelligence systems on both sides.

*The Decisive Factor.*—But the tendency to interpret war wholly in terms of the mechanical apparatus of war is one to be avoided. The dominating factor in the War was not guns but maritime geography and was to be found in the Sound, in the Bight, at Dover and at Otranto. When the War broke out, grave doubts arose in the minds of some as to the advisability of sending a British army to France in the face of an undefeated German Fleet. It was not merely the inactivity of the German Fleet, but maritime geography and the dangers of approach to the Straits of Dover at night that enabled this to be done in safety. England was 300 m. ahead of Germany. The War was dominated by the fact that Germany's path to the ocean was barred by the solid bulk of the British Isles. It was peculiar in another way. Both navies were working in close proximity to their principal bases of repair and supply, and both navies were therefore able to exert the full strength of all their combined weapons of air, sea and submarine to an extent only possible within a reasonable distance (say 1,000 m.) of the great bases of a fleet. The navy that fights within easy reach of its great bases and principal industrial centres, fights at a great advantage. The lessons of the World War must not therefore be applied indiscriminately to the conditions of a war 5,000 m. away.

It is barely possible for a single mind to envisage in all their aspects the colossal ramifications of the War or to gauge precisely the relative part played in the final victory by economic, naval or military pressure. But this may be said. If the British navy in that tremendous quartet of years had to face an even greater task than anyone dreamt of when King George called it the "Sure Shield" of the nation, it could feel that this confidence had not been misplaced on that memorable day when Beatty received the surrender of the great German Fleet.

**WORLD WAR: BIBLIOGRAPHY**—The following list of books, selected with much care from several thousands on the subject, is designed to provide the general reader with the best information available in book form concerning the World War as regards both its main aspects and the events which were of most importance therein. An effort has also been made to give the names of at least one or two books relating to events in each of the minor theatres or sub-theatres of the War, and where controversial matter still exists references to books on both sides are given.

Books in foreign tongues have been confined to those in French, German and Italian. Where books in several volumes have been published at intervals, the date given is usually that of the last volume to appear.

#### ORIGINS AND RESPONSIBILITY (see also under Political)

- Rt. Hon. H. H. Asquith, *The Genesis of the War; etc.* (1923);  
 M. Edith Durham, *The Serajevo Crime.* (1925);  
 Hermann von Eckhardstein, *Ten years at the Court of St. James 1895-1905.* (1921);  
 Germany, Foreign Office, *Deutschland schuldig?* (1919);  
 By a German (R. Grelling), *J'accuse!* Translation by A. Gray. (1915);  
 J. W. Headlam, *The History of Twelve Days.* (1915);  
 J. W. Headlam, *The Outbreak of War.* Foreign Office Documents. (1926);  
 K. Kautsky, *Outbreak of the World War* (1924). Translation. Full collection of German official documents—*Die deutschen Dokumente zum Kriegsausbruch.* 6 vol. (1919);  
 Prince K. Lichnowsky, *My Mission to London 1912-14.* (1918);  
 Count Max Montgelas, *The Case for the Central Powers.* (1925);  
 Dr. W. Mühlen, *Dr. Mühlen's Diary, 1914.* (1918);  
 C. Oman, *The Outbreak of the War of 1914-18.* Based on official documents. (1919);  
 R. Poincaré, *The Origins of the War.* (1921);  
*Das Russische Orange-Buch von 1914.* (1925);  
 R. W. Seton-Watson, *Serajevo.* (1926).

#### GENERAL HISTORIES (Chronological)

- Annual Register, Great Britain, *The Annual Register.* (1914-9);  
*Brassey's Naval Annual.* Portsmouth. (1914-9);  
*Whitaker's Almanac* (1914-9), short chronologies;  
*Chronology of the War, 1914-19.* Edited by Lord Edward Gleichen. 3 vol. (each of 2 years) and atlas. (1918-20);  
 Committee of Imperial Defence (Historical Section), *Principal Events 1914-1918.* (1922);  
 S. R., *Chronologie de la Guerre.* 10 small vol. (1919);  
 "Times, The," *The Times Diary and Index of the War, 1914-18.* (1921);

#### HISTORIES (see also under Military Operations)

- Gen. Schwarte's volumes (q.v.). *Austro-Hungarian Campaigns.* Nothing official published. Good material in Gen. Schwarte's volumes. (1920, etc.);  
 Gen. Oberst A. Arz, *Zur Geschichte des grossen Krieges 1914-18.* (Eastern Front). (1924);  
 J. Buchan, *A History of the Great War.* 4 vol. (1921);  
*Bulletin Belge des Sciences Militaires*, Belgian official account of the War coming out in this periodical;  
 Gén. Cherfils, *La Guerre d la Délivrance.* 3 vol. (1920-2);  
 Lt.-Col. M. L. V. H. Corda, *La Guerre Mondiale 1914-18.* (1922);  
 L. Cornet, *1914-1915 Histoire de la Guerre.* Political and general. (1915-22);  
 Brig.-Gen. J. E. Edmonds, *Official History of the Great War.* With maps and plans. (1925, etc.);  
*Diario Della Guerra d'Italia.* Official; 65 parts. (1923);  
*The Military and Financial Effort of Italy during the War.* Official figures. (1919);  
*Les Armées Françaises dans la Grande Guerre.* French Official History of War. 2 vol. of chronological dictionary of formations during whole War. 1 vol. (thin) story. Numerous vol. of documents only. Difficult to obtain;  
 Sir Charles P. Lucas, *The Empire at War.* Dominions and colonies in particular. 3 vol. (1921, etc.);  
 Nations of To-day Series. Ed. J. Buchan. 12 separate vol. *Great Britain* (2), *Bulgaria and Rumania*, *France*, *Belgium*, *Italy*, *Ireland*, *India*, *Yugoslavia*, *Baltic and Caucasian States*, *British America*, *Japan.* Description of War, etc., in each. (1923, etc.);  
 Gén. B. E. Palat, *La Grande Guerre sur le Front Occidental.* 11 vol. (1917, etc.);  
 A. F. Pollard, *A Short History of the Great War.* (1920);  
 Reichsarchiv, *Der Weltkrieg 1914-18.* German official History of the War. 2 vol. out, of probably 12. A popular abbreviated edition of each vol. is also published. (1922, etc.);  
 Gen. Lt. M. Schwarte (Ed.), *Der Grosse Krieg 1914-18.* Very good and full. 11 vol. to date. (1921-4);

- "Times, The," *Documentary History of the War.* 11 vol. (1917, etc.);  
 Capt. A. Tosti, *La Guerra Italo-Austriaca 1915-18.* Good official resume. (1925);  
 G. M. Trevelyan, *The War and the European Revolution in relation to History.* (1920).

#### MISCELLANEOUS

- Pierre Gilliard, *Le tragique destin de Nicolas II. et de sa famille.* (1921);  
 G. P. Gooch, *History of Modern Europe 1878-1919.* (1923);  
 Anonymous, *The Pomp of Power.* (1922);  
 N. Sokolov, *The Murder of the Imperial Family.* (1921);  
 War Office, *Statistics of the Military Effort of the British Empire 1914-1920.* (1922);  
 H. Wickham Steed, *Through 30 years (1892-1922).* (1924).

#### HISTORIES OF ARMIES AND CONTINGENTS

- Australia*  
*Official History of Australia in the War*, 12 vol. (1925);  
 Lt.-Gen. Sir J. Monash, *The Australian Victories in France in 1918.* (1920);  
*Canada*  
 Report: Canada, *Ministry of Overseas Military Forces. Report 1918.* (1919);  
 Lt.-Gen. Sir A. W. Currie, *Canadian Corps Operations during 1918.* (1920);  
 Maj. C. G. Roberts and M. Aitken (Lord Beaverbrook). *Canada in Flanders.* 3 vol. (1918);  
 Capt. H. Steele, *The Canadians in France 1915-1918.* (1920);  
*India*  
 Gen. Sir J. Willcocks, *With the Indians in France.* (1920);  
*New Zealand*  
 H. T. B. Drew, *The War Effort of New Zealand.* 4 vol. (1924);  
 Col. H. Stewart, *The New Zealand Division 1916-1919.* (1921);  
*South Africa*  
 John Buchan, *History of the South African Forces in France.* (1920);  
 South Africa, Department of Defence, *The Union of S. Africa and the Great War.* Official history. (1924);  
*United States*  
 Maj.-Gen. R. L. Bullard, *Personalities and Reminiscences of the War.* (1925);  
 Lt.-Col. de Chambrun and Capt. de Marenches, *L'armée américaine dans le conflit européen.* (1921);  
*Final Report of Gen. J. J. Pershing.* (1919). Covers history of U.S.A. forces;  
 Capt. Shipley Thomas, *History of the American Expeditionary Force.* (1920);  
 United States, G.S., Historical Branch, *Monographs* (3) on *Mobilisation*, *Economic Agencies*, etc. (1921).

#### ARMS OF THE SERVICE

- Maj.-Gen Sir L. J. Blenkinsop and Lt.-Col. J. W. Rainey, *Official History of the Veterinary Services.* (1925);  
 Lt.-Col. F. S. Brereton, *The Great War and the R.A.M.C.* (1919) (see also Macpherson, under Medical and Casualties);  
 Bt.-Col. J. F. C. Fuller, *Tanks in the Great War, 1914-18.* (1920);  
 Royal Engineers' Institute, *The Work of the R.E. in the European War 1914-19.* (1921, etc.).

#### MILITARY OPERATIONS

- The Western Front.*  
 Terms of Armistices concluded with Germany, Austro-Hungary and Turkey. Cmd. 53. (1919);  
 Belgian Army, *La campagne de l'Armée belge, July 31 1914-Jan. 1 1915.* (1915);  
*The War of 1914.* Official. (1915);  
 Commandant Willy Breton, *Pages d'Histoire.* (1915, etc.). On Belgian operations. Various volumes. Official basis;  
 Maj. A. Corbett-Smith, *The Retreat from Mons.* (1916);  
 Maj. A. Corbett-Smith, *The Marne—and After.* (1917);  
 P. H. Courrière, *Comment fut sauvé Paris.* (1918);  
 H. Dugard, *La victoire de Verdun, Feb. 21 1916-Nov. 11 1917.* (1918);  
 Général Dupont, *Le haut commandement allemand en 1914.* (1922). From German standpoint;  
 Gen. E. v. Falkenhayn, *General Headquarters, 1914-16, and its critical decisions.* (1919)  
 Field-Marshal Visct. French. 1914. (1919);  
 Field-Marshal Visct. French, *The Despatches of Lord French, 1914-15.* (1917);  
 General Staff, Germany, *Der Grosse Krieg in Einzeldarstellungen* (1920). Selected episodes, 8 parts published;  
 Ypres, 1914. Trans. (1919);  
 Germany, Reichskanzlei, *History of events immediately preceding the Armistice.* Official German. (1920);  
*Les origines de l'Armistice.* Translated by Koeltz (German official). (1919);

- Sir D. Haig's despatches, 1915-19.* Ed. by Lt.-Col. J. H. Boraston. (1919);  
 Capt. Lord Ernest Hamilton, *The First Seven Divisions* (in 1914). (1916);  
 G. Hanotaux, *Histoire illustrée de la guerre de 1914*. 13 vols. (1914, etc.);  
 Gen. Oberst A. v. Kluck, *Der Marsch auf Paris und die Marne-Schlacht, 1914*. Also in English (1920);  
 J. Maercker, *Vom Kaiserheer zur Reichswehr*. (1921). German Revolution;  
 Maj.-Gen. Sir F. Maurice, *Forty Days in 1914*. (1919);  
 Maj.-Gen. Sir F. Maurice, *The Last Four Months* (1919);  
 G. S. Gordon, *Mons and the Retreat*—with preface by Lord French. (1918);  
 Oberstlt. A. Niemann, *Kaiser und Revolution*. (1922);  
 Reichsarchiv, Germany, *Schlachten des Weltkrieges*. (1921, etc.);  
 Gen. Sir H. L. Smith-Dorrien, *Memories of Forty-eight Years Service* (incl. 1914). (1925);

## Austro-Italian

- Gen. L. Cadorna, *La guerra alla fronte italiana, etc.* (1915-Nov. 1917). 2 vol. (1921);  
 Gen.-Lt. A. von Cramon, *Quatre ans au G.Q.G. austro-hongrois*. (1922). As German representatives;  
 Italy, Comando Supremo, *Report on battle of Vittorio Veneto*. (1919);  
 Gen. Maj. H. Kerchnawe, *Der Zusammenbruch der oesterreichisch-ungarischen Wehrmacht in 1918*. (1921);

## Russian

- Gen. B. Gourko, *Russia in 1914-17*. (1918);  
 Gen. M. Hoffmann, *The War of Lost Opportunities*. (1924). Eastern Front. Translation;  
 Maj.-Gen. Sir A. Knox, *With the Russian Army, 1914-17*. (1921);  
 Capt. R. S. G. Watkin-Williams, *Under the Black Ensign*. (1922). Operations on the Murman Coast;  
 S. R. (Serge Raffalovitch), *Pages d'histoire. L'Histoire de la révolution russe, 1905-1917*. (1917);

## Balkan

- G. Gordon-Smith, *Through the Serbian Campaign (and retreat)*. (1916);  
 G. Gordon-Smith, *From Serbia to Yugoslavia, 1914-18*. (1920);  
 Lt.-Col. Hon. H. D. Napier, *Experiences of a Military Attaché in the Balkans*. (1924);  
 H. C. Owen, *Salonica and after*. (1919);  
 C. Price, *Serbia's Part in the War*. Vol. I. (1918);  
 G. W. Price, *The Story of the Salonica Army*. (1917);  
 Reichsarchiv Einzelschriften, *Der Endkampf in Macedonien*. (1921);  
 Gen. Sarraill, *Mon Commandement en Orient (Salonica), 1916-18*. (1920);  
 Lt. M. Sturdza, *Avec l'armée roumaine, 1916-18*. (1918);  
 L. Villari, *The Macedonian Campaign*. (1922);

## Dardanelles and Gallipoli

- Brig.-Gen. C. P. Aspinall, *Gallipoli*. Official history; (1926);  
*The Final Report of the Dardanelles Commission*. (1919);  
 Gen. Sir I. Hamilton, *A Gallipoli Diary*. 2 vol. (1920).  
 Gen. O. Liman v. Sanders, *Fünf Jahre Türkei*. (1922), incl. Dardanelles;  
 J. Masefield, *Gallipoli*. (1923);  
 P. F. Schuler, *Australia in Arms (Anzac)*. (1916);  
 Dr. H. Stuermer, *Two War Years in Constantinople*. (1917). Translation;  
 Turkey, Historical Section of Staff, *Campagne des Dardanelles*. (1924);

## Egypt and Palestine

- A. Aaronsohn, *With the Turks in Palestine*. (1917). Translation;  
 Lt.-Col. G. E. Badcock, *History of the Transport, Services, Egyptian Expeditionary Force*. (1925);  
 Maj.-Gen. Sir M. Bowman-Mainfold, *An outline of the Egyptian and Palestine campaigns, 1914-18*. (1922);  
 E. Dane, *British Campaigns in the Nearer East, 1914-18*. (1919);  
 Egyptian Expeditionary Force, *Record of the advance of the Egyptian Expeditionary Force, July 1917-Oct. 1918*. (1919). From official sources;  
 Lt.-Col. P. G. Elgood, *Egypt and the Army (Egypt during the War)*. (1924);

**WORTHINGTON-EVANS, SIR LAMING** (b. 1868), British politician, was born Aug. 23 1868 and became a solicitor in 1890. In 1910, after one unsuccessful attempt, he was elected conservative M.P. for Colchester, and in 1918 for the Colchester division of Essex. In 1916 he entered the Coalition Govt. as parliamentary secretary to the Ministry of Munitions, having previously been controller of the foreign trade department of the Foreign Office. He left the Ministry of Munitions in 1918 to become Minister of Blockade, and afterwards filled the following offices under Mr. Lloyd George and Mr. Baldwin: Minister of Pensions, 1918-20; Minister without portfolio, 1920-1; Secretary for War, 1921-2; Postmaster-General, 1923-4; and again Secretary for War, 1924. He has written books on company law.

**WRANGEL, PETER NICHOLAIEVICH, BARON** (1878- ), Russian soldier, was born at St. Petersburg (Leningrad) Aug. 15 1878. After experience in the ranks of the horse guards and as a mining engineer in Siberia, he served as an officer in a Cossack regiment, transferring after the Russo-Japanese War to the horse guards as a captain. During the World War he commanded successively a squadron, a regiment and a division of Cossacks. He was one of the first officers to join Kaledin against the Bolsheviks. After Kaledin's suicide Wrangel allied himself to Alexeyev and Deniken, distinguishing himself particularly by his defence of Tsaritsyn. On April 4 1920, after Deniken's retreat, Wrangel was appointed commander-in-chief of the volunteer army. From May to Oct. 1920 his forces met with considerable success, but after the signing of a peace treaty between Poland and the Bolsheviks the tide turned. On Nov. 15, Sebastopol was lost and the evacuation of the army carried out.

**WRESTLING** (see 28.844).—The popularity of this sport among amateurs has increased considerably since the institution of the modern Olympic Games, as is proved by the extension of the number of nations entering competitors for these Games. At the Games held in Paris, 1924, no fewer than 25 countries were represented. At the same time, the catch-as-catch-can (free) style, the inclusion of which in the Games was secured by Great Britain in 1914, has made great strides. At Antwerp, in 1920, of the four weights contested, two championships were secured by Finns and one by a Swiss. In 1914, the weights were increased to seven. Switzerland captured two, Finland one, the four others went to the United States. Great Britain's solitary success was third place in the heavy weight.

The pre-eminence in the Graeco-Roman style that France once held has been transferred to the Scandinavian countries. The Finnish wrestlers have proved the most successful. Finland and Sweden shared the championships in the Games at Stockholm, 1912, repeated the success at Antwerp, 1920 and won four of the six weights at Paris, 1924; France and Estonia respectively taking the heavy and bantam weights.

In 1924, Turkey, Egypt and Japan were represented for the first time, with results indicating that the Western styles of wrestling are being well studied throughout the East. The inauguration, in 1921, of an International Federation of Amateur Wrestling will certainly lead to a yet wider development of the sport. In Great Britain, apart from professional tournaments encouraged by local associations in the northern and western counties, it seems probable the sport would have disappeared altogether but for the exertions of the National Amateur Wrestling Association. This organisation has kept the sport alive by the holding, except during the War, of annual championships at various weights in the Cumberland and Westmoreland and catch-as-catch-can styles.

**BIBLIOGRAPHY.**—H. Leonard, *Handbook of Wrestling* (1897); G. Bothner, *Scientific Wrestling* (1912); Cann and Hastings, *Manual of Wrestling* (1912); P. Longhurst, *Wrestling* (1917). (P. Lo.)

**WRIGHT, SIR ALMROTH EDWARD** (1861- ), British bacteriologist, was born at Middleton Tyas, Yorks., Aug. 10 1861. He was educated at Dublin University, and afterwards studied law, subsequently obtaining his scientific and medical training at the Universities of Leipzig, Strasbourg and Marburg. In 1887 he became a demonstrator of pathology at Cambridge, in 1889 went to Sydney as lecturer in physiology and from 1892 to 1902 was professor at the army medical school at Netley, being then appointed professor of experimental pathology in the university of London. He was in addition principal of the institute of pathology and research at St. Mary's Hospital, and was attached to the medical research service under the National Insurance Act. He was knighted in 1906 and was elected F. R. S. in the same year.

Sir Almroth Wright came into prominence primarily by his remarkable researches into the problems of parasitic diseases (see 20.775; 783). He introduced the system of anti-typhoid inoculation and also did much valuable work on the preparation of other vaccines and toxins, while he carried out many important experiments in bacterial infection and in measuring the protective matter of human blood. He acted as consulting physician to the army in France from 1914-9 and was in 1919 created K. B. E. He was a member of many learned societies and received numerous British and foreign awards and honours including the gold medal of the Royal Society of Medicine in 1920. He published a short Treatise on *Anti-Typhoid Inoculation* (1904); *Principles of Microscopy* (1906) and *Studies in Immunisation* (1909) besides many papers in medical and scientific journals. In 1913 appeared *The Unexpurgated Case against Woman Suffrage* which provoked much discussion. (See HUMANITY.)

**WRIGHT, WILBUR** (1867-1912), American inventor, was born near Millville, Ind., April 16 1867, the son of Milton Wright, a bishop of the United Brethren in Christ. After a high school education in Richmond, Ind., and Dayton, O., together with his brother Orville, he opened a shop for repairing bicycles at Dayton. The Wright brothers early became interested in the problem of flying, and from about 1900 made many experiments with gliding machines at Kittyhawk, North Carolina. On Dec. 17 1903, such a machine with a petrol motor attached flew 260 yd., the first successful flight of an aeroplane; and on Oct. 5 1905, near Dayton, they accomplished their first successful long flight, more than 24 mi., at the speed of 38 m. an hour. In spite of this proof of the practicability of flight in heavier-than-air machines, they were unsuccessful in enlisting financial support in America. In 1908 Wilbur Wright went to France, and on Sept. 21 won the Michelin Prize by a flight of 56 miles. This brought him international fame. In Dec. of the same year he made from Le Mans, France, a flight of 77 m. in 2 hr. and 20 minutes. In 1909, during the Hudson-Fulton

Exposition in New York City, he flew from Governor's Is. up the Hudson river to Grant's tomb and back, travelling 21 m. in 33 minutes and 33 seconds. On March 3 1909, Congress awarded the Wright brothers a special medal. Later the U.S. Govt. purchased a machine for \$30,000, and afterwards the invention was officially adopted by the U.S. Army. The French patents were sold for \$100,000. After 1910 Wilbur Wright gave up public flying and devoted his time to mechanical improvement of the Wright machine. He received many medals and honours from European countries. He died at Dayton May 30 1912.

His brother, ORVILLE WRIGHT (1871- ), was born at Dayton, O., Aug. 18 1871. He was educated in the Dayton schools, worked with his brother Wilbur in the bicycle-repairing business, and was closely associated with him in all his experiments in developing a practicable aeroplane. He shared in the many honours awarded by foreign countries, and after the death of his brother became director of the Wright Aeronautical Laboratory at Dayton. In 1913 he received the Collier trophy for developing the automatic stabiliser. In 1915 he was appointed a member of the U.S. Naval Consulting Board. The same year the Wright Aeroplane Co. sold its patents to a New York syndicate, Orville Wright remaining chief engineer.

**WRIGHT, WILLIAM ALDIS** (1836-1914), British man of letters (see 28.847), died at Cambridge May 19 1914. His last publication was *The Hexaplar Psalter* (1911).

**WUNDT, WILHELM MAX** (1832-1920), German philosopher (see 28.855) died near Leipzig Aug. 31 1920. His latest work was *Die Nationen und ihre Philosophen* (1915).

**WU PEI FU** (1873- ), Chinese general, was born at Shantung. He graduated from the Kai Ping military academy, near Tientsin, in 1898, after a brilliant scholastic career, and, after a short spell of service, entered a military school of which Marshal Tuan Chi-jui was director. He joined the Third Army Division, commanded by Tsao Kun, distinguished himself in several minor campaigns, and was rewarded by Tsao Kun in 1916 with the command of a division. The civil wars that followed the death of Yuan Shih-K'ai in that year gave ample opportunities to a soldier of Wu Pei-fu's ability and by 1917 he was the Peking Government's chief bulwark against the Monarchists, Sun Yat-sen's independent republic at Canton and the ambitions of Marshal Chang Tso-lin, the governor general of Manchuria. Sun Yat-sen was not in a position to take the offensive, but Chang Tso-lin invaded Chihli in the spring of 1922 and, being defeated by the forces of Wu Pei-fu launched another attack in 1924. Wu Pei-fu was defeated in a great battle near Tientsin in Oct. and fled after which he remained in retirement at Yochow.

**WÜRTTEMBERG** (see 28.856), a free State and territory of the German Reich (*Volkstaat Württemberg*). Its area is 7,534 sq. m. and its population (1921) 2,591,340. (See GERMANY.)

*Political History.*—Up to 1918 Württemberg was a monarchy. Its ancient constitution was somewhat out of date, but King William II. was universally popular. Differences were rather acute between the Conservatives and Catholic Centre ("Black and Blue bloc") and the Left. The general tendency was, however, liberal. The Weissäcker Ministry, which held office during the War, resigned in Oct. 1918 in consequence of the alterations in the constitution of the Reich introduced by its Chancellor, Prince Max of Baden. A new coalition Parliamentary Govt. was about to meet when revolution broke out on Nov. 9. The first revolutionary Government was formed solely of Socialists, but its extreme members left it on Nov. 11, and members of the Catholic Centre, the Democrats and the National Liberals entered the Cabinet. The King abdicated Nov. 30. In Jan. 1919, there were industrial disturbances, soon suppressed, after which the Independent Socialists left the Ministry. After this date the Social Democrats and the Liberal parties co-operated without friction.

*Constitution.*—The new constitution was adopted on Sept. 25 1919. The powers of the State proceed from the people, which transfers them to the Diet, retaining, however, the right of dissolving the Diet or giving a popular vote on a law. The Diet

transfers the executive power to the Government. At the head of the Government there is the minister-president, who has the title of President of the State but is not independent of the Diet. The Diet elects the President of the State, who selects the Ministry in accord with the Diet. A peculiarity of the Württemberg constitution is that councils (*Beiräte*), formed from the different classes according to occupations (*Berufsstände*), are attached to the Ministries. Elections for the Diet take place every four years. No provision is made for a dissolution of the Diet except that, as already mentioned, the Diet can be dismissed by a vote of the people. After the elections of 1920 the Government was formed by the Centre and Democrats, supported by the Social Democrats; it passed several important laws, especially that regulating the relations of Church and State. The elections of 1924, on a new franchise, brought a more conservative ministry, formed by the "Bürgerpartei" and Catholic Centre, under Herr Bazitte, leader of the Bürgerpartei. (W. v. B.)

**WYNDHAM, SIR CHARLES** (1837-1919), British actor (see 28.872), died in London Jan. 12 1919. In 1916 he married, as his second wife, Miss Mary Moore, who had been for many years his leading actress and his partner in management.

**WYNDHAM, GEORGE** (1863-1913), British politician and man of letters, was born Aug. 29 1863, the eldest son of Percy Scawen Wyndham, and grandson of the 1st Lord Leconfield. His mother was Madeline Caroline Frances Eden, daughter of Sir Guy Campbell, Bart., and through her he was great-grandson of Lord Edward Fitzgerald, the Irish rebel. He was educated at Eton and Sandhurst, obtained a commission in the Coldstream Guards in 1883, and served through the Suakin campaign of 1885. But, interested as he was in soldiering, his eager temperament impelled him still more to adventure into politics and letters. He left the army in 1887, married Sibell Mary, daughter of the 9th Earl of Scarborough, widow of Earl Grosvenor, mother of the 2nd Duke of Westminster, and became private secretary to Mr. Balfour, at the time Irish Secretary. In 1889 he entered Parliament as Conservative member for Dover and retained the seat till his death.

After serving, from 1898-1900, as financial secretary to the War Office, he was appointed in 1900 Chief Secretary for Ireland. Having been private secretary for four or five years to the most successful Chief Secretary of modern times, he started with a large store of experience; and his appointment was regarded with benignity even by the Nationalists on account of his descent from Lord Edward Fitzgerald. His early work in Ireland met with general approval. He developed enormously the Conservative policy of land purchase; and the Act which he carried in 1903 for that end was the most comprehensive measure of the kind ever submitted to Parliament. He entertained hopes of arranging some form of local government which should sufficiently meet Nationalist demands, and with this in view appointed in 1902 an eminent Anglo-Indian, Sir Antony (afterwards Lord) MacDonnell, who was known to be a decided Home Ruler, to the under-secretaryship, giving him at the same time greater authority and wider scope than is usually conferred on a civil servant. The Unionist party, both in Ireland and in England, became suspicious of the tendencies of his administration, and he was driven in 1905 to resignation. He never held office again, but he was very active in support of the causes which he had at heart, such as tariff reform and woman suffrage; he was a keen critic of Lord Haldane's army reforms, and threw himself vigorously into the "Diehard" campaign against the Parliament Bill in 1911.

This varied political activity was, however, but a portion of his life. He was also a man of letters, possessed of fine taste and a graceful style. Here his genius was stimulated by his friendship for W. E. Henley, who dedicated a book to "George Wyndham, soldier, courtier, scholar." His principal published work was an edition of *Shakespeare's Poems* (1898); but he wrote also on North's *Plutarch* and *Ronsard*. The Admirable Crichton of his day, handsome and debonair, he was keen alike on field sports and the arts, the friend and admirer equally of Cecil Rhodes and of Rodin, a working railway director and an efficient

colonel of yeomanry, the pet of society and the recipient of honorary distinctions from several universities. On June 8 1913, at the comparatively early age of 50, he died in Paris of congestion of the lungs, after only a few hours' illness. (G. E. B.)

**WYOMING** (see 28.873).—The population according to the state census of 1925 was 206,381. In 1920 it was 194,402, an increase of 33.2% in the decade 1910–20, as against an increase of 57.7% in the preceding decade. The density of population was two per sq. m. in 1920. The rural population in 1920 was 137,054; the urban population (in places having 2,500 or more) was 57,348 or 29.5%. The principal cities are:—

|                    | 1925           | 1920   | 1910   |
|--------------------|----------------|--------|--------|
|                    | (state census) |        |        |
| Casper . . . . .   | 23,288         | 11,447 | 2,639  |
| Cheyenne . . . . . | 13,202         | 13,829 | 11,320 |
| Laramie . . . . .  | 9,629          | 6,301  | 8,237  |

In 1920 there were 25,255 foreign-born whites, 1,375 negroes, 1,343 Indians and 1,538 Asiatics. In 1922 Wyoming ranked lowest among the states of the Union in its death rate (9.3 per 1,000 population).

**Agriculture.**—In 1924 there were 15,687,833 ac. of unappropriated public lands. The area of national forests was 8,426,927 acres. The period following the World War was one of depression for the ranching and agricultural interests. The open range and the old-time cattle ranch were giving place to a more varied agriculture, and experiments, such as dairying and honey production, became increasingly prominent. The number of farms in 1920 was 15,748. The acreage for all crops for 1923 was 1,784,000. Wyoming ranks second among the States in number of sheep. The estimate for Jan. 1 1924 was 2,700,000, valued at \$24,300,000. The wool product for 1923 was 19,520,000 lb., an average weight of 8 lb. per fleece. On Jan. 1 1924, there were 825,000 cattle, valued at \$25,891,000; 190,000 horses, valued at \$5,700,000; 3,000 mules, valued at \$165,000 and 129,000 swine, valued at \$1,290,000. Important agricultural products in 1923 were:—

| Crop                | Acres Sown | Production           | Value        |
|---------------------|------------|----------------------|--------------|
| Hay, tame . . . . . | 730,000    | 1,409,000 short tons | \$13,526,000 |
| Hay, wild . . . . . | 315,000    | 331,000 short tons   | 2,979,000    |
| Oats . . . . .      | 165,000    | 5,610,000 bu.        | 2,637,000    |
| Wheat . . . . .     | 175,000    | 2,785,000 bu.        | 2,228,000    |
| Corn . . . . .      | 150,000    | 4,050,000 bu.        | 2,835,000    |
| Barley . . . . .    | 28,000     | 840,000 bu.          | 546,000      |
| Potatoes . . . . .  | 18,000     | 1,800,000 bu.        | 1,674,000    |

Sugar beets have been important in the last few years; in 1924 the acreage sown was 25,000 which produced 260,000 tons, valued at \$1,950,000. The irrigated area in 1924 was 1,007,083 acres. The area capable of irrigation under completed systems was 2,035,000 acres. There were 874,615 ac. of dry farm land and 16,872,152 ac. of grazing land privately owned. In 1910 89% of the farms were operated by owners; in 1920, 85.1%.

**Mining.**—The total value of Wyoming's mineral products for 1923 was \$77,664,547. Wyoming ranked tenth in the output of bituminous coal with 7,575,031 short tons valued at \$20,916,000. Other items were: gypsum, 33,644 short tons valued at \$176,791; sand and gravel, 1,377,271 short tons valued at \$403,911; stone, 186,150 short tons valued at \$281,595; and clay products valued at \$136,493. Copper and iron mining declined. Most important in mining development after 1912 was the petroleum industry. The total production to the end of 1921 was 89,356,000 barrels. In 1923 Wyoming ranked fourth among the States in oil pro-

duction, with an output of 44,785,000 bbl. valued at \$48,900,000, at the wells, the greater part from the Salt Creek field in Natrona county. There were some 50 pipe lines varying from 3 to 104 m. in length. There were 19 oil refineries with a capacity per day of 94,000 bbl. and 11 gasoline plants. Natural gas became important after 1916. In 1923 Wyoming ranked eighth with an output of 35,523,000 million cu. ft., valued at \$4,222,000. It ranked sixth in production of natural gas gasoline with an output of 21,292,000 gal., valued at \$1,992,000.

**Manufactures and Railways.**—Manufactures are of little importance aside from railway shops and the petroleum-refining industry. The increase shown in the table is due chiefly to the latter.

|                                      | 1921         | 1919         | 1909        |
|--------------------------------------|--------------|--------------|-------------|
| Number of establishments . . . . .   | 254          | 576          | 268         |
| Persons engaged . . . . .            | 8,337        | 8,095        | 3,393       |
| Value of products . . . . .          | \$80,246,919 | \$81,445,394 | \$6,249,078 |
| Value added by manufacture . . . . . | 31,927,000   | 39,194,866   | 3,640,889   |

Railway mileage in 1909 was 1,623 m., in 1922 1,959 miles.

**Education.**—There has been considerable progress in education. In 1914 the school enrolment was 29,301, in 1924, 50,581. The total expenditure for schools in 1914 was \$1,265,750; in 1924, \$5,761,655. The permanent common school fund in 1914 was \$632,855; in 1924, \$10,955,373. The percentage of illiteracy among persons ten years of age and over was 2.1% in 1920. The state university exhibited a remarkable growth. In 1913–4 there were 411 students in residence; in 1923–4, 1,726.

**History.**—Wyoming was the first state to provide for woman suffrage, and the first to elect a woman as governor. The nine amendments to the constitution and the legislation of recent years indicate a gradual development from frontier conditions and an increasing measure of public control of business and of social welfare. A workmen's compensation law, a mothers' pensions law, an eight-hour day for underground work in mines, a 56-hour week for women and a child labour law, illustrate the latter. In 1915 a public service commission was established, in 1919 a "blue sky" law was passed, in 1921 a system of rural credits was begun and a dept. of oil and gas conservation provided for, in 1923 a state dept. of agriculture was created and laws passed to facilitate co-operative marketing and to prevent price discriminations in the sale of coal, oil and other products of the soil. The problem of fair distribution of the waters of interstate rivers has been a vexing one to Wyoming as to other states dependent on irrigation.

The direct primary was adopted in 1911, the executive budget system in 1919. The state debt was \$99,000 in 1918, \$4,133,000 in 1922, \$2,937,000 in 1924, the increase being due chiefly to road building. Wyoming has been normally a Republican state in politics, but since 1910 opposing parties have won frequent victories. A combination of Progressives and Democrats won in 1910. Francis E. Warren (Rep.) was re-elected to the U.S. Senate in 1912, 1918, 1924, but John B. Kendrick (Dem.) was elected as his colleague in 1916 and 1922. The presidential vote in 1912 was 15,310 for Wilson, 14,560 for Taft, 9,232 for Roosevelt; in 1916, 28,316 for Wilson, 21,698 for Hughes; in 1920 35,091 for Harding, 17,429 for Cox; in 1924, 41,858 for Coolidge 25,174 for La Follette, 12,868 for Davis. Governors since 1911 have been: Joseph M. Carey (Prog.), 1911–5; John B. Kendrick (Dem.), 1915–7; F. L. Houx (acting, Dem.), 1917–9; Robert D. Carey (Rep.), 1919–23; William B. Ross (Dem.), 1923–5; Nellie Taylor Ross (Dem.), 1925– (L. A. W.)

**YACHTING** (see 28.890 and 12.916).—Much of the finest racing in the whole history of yachting took place from 1910 until 1913. The International Yacht Racing Union was well established, and its rule of measurement and rating had produced and was still producing very sound and seaworthy boats in many classes. British yacht building was flourishing, German yachting was at its zenith under the Kaiser. International regattas on a big scale were held at Spithead in 1911, at Kiel in 1912 and at Le Havre in 1913. The number of racing yachts, steam yachts and cruisers sailing about the coast exceeded all records. The history of yachting for nearly 100 years shows that when racing is successful the whole pastime benefits. America was attracted to European yachting during this halcyon period and in 1910 a wonderful American racing schooner came to Europe, the "Westward," 323 tons, designed and built by Herreshoff. She started in 11 races and won them all. Sir Thomas Lipton's 23-metre cutter "Shamrock" remained the best British cutter during these seasons.

In 1910 there was a remarkable class of 15-metre yachts about 50 tons. Sir William Burton's "Osturu" led it, followed by "Vanity," the King of Spain's "Hispania," "Mariska," "Tritonia" and "Ma'oonia." In 1911 the 19-metre class made their appearance. There were four cutters of exactly 100 tons, "Octavia," "Mariquita," "Corona" and "Norada." They were almost exactly equal in speed, and it was only the cleverness of Sir William Burton as a helmsman that enabled the "Octavia" to lead the fleet by the narrowest margin, just as his "Ostava" had been at the top of the "15's" in the previous year. Both were designed by Alfred Mylne.

*Nicholson's "Istria" Design.*—The season of 1912 was chiefly notable for the appearance of a new 15-metre yacht, the "Istria," designed on novel lines by C. Nicholson for Sir Charles Allom, and the first of a series of yachts by the same clever designer which quickly began to defeat the purpose of the "International Racing Rule" (see 28.894). In 1912 and 1913 his great schooners "Margherita," "Istria," "Pamela," "Paula III." and others were of most undesirable type, but so efficient as racers that they outailed the yachts of all other designers. The features of these yachts were huge sails, shallow heavy bodies, high freeboard, short water line and great overall length. It was in connection with the "Istria" that the term "Marconi topmast" was first used, her topmast having a large number of small wire stays to support its enormous height. Nicholson defeated all comers in the last stages of the International Rule of 1907-17 and may be said to have killed it. An interesting experiment was effectively carried out by the marquess of Ailsa from 1909-14. He repurchased his old 40-tonner "Bloodhound," built in 1874, and gave her new rigging, spars, sail plan and keel. He started her in 217 races and, sailing with modern yachts, she crossed the winning line first on 32 occasions. She won 64 first prizes—a remarkable achievement.

*The New Rating Rule.*—On the eve of Cowes Week, 1914, the War put an end to all yacht racing. The pastime was only revived in 1919-20, after much difficulty, by the Yacht Racing Association. At the end of the War the Scandinavian nations, having amassed great wealth, purchased nearly all the best British racing yachts. The cost of building new yachts was prohibitive and the high wages of sailors raised the running expenses to nearly treble the pre-War rate. At the instance of the Y.R.A. the International Yacht Racing Union was reformed and a new rating rule was adopted. The new rule reduced the sails of racing yachts to about two-thirds of the pre-War size and prescribed a more compact form of hull, measures which enabled crews to be reduced and thus effected a substantial saving in running costs. As more normal conditions returned many of the old British yachts were repurchased from Scandinavia. The greatest encouragement of all, however, was that the King took the lead in the sport and fitted out the old "Bri-

tannia" for racing. This Royal yacht, built in 1893, by a peculiar coincidence of events, had a hull-form very similar to the shape favoured by the new rating rules of 1920, and after some alterations raced successfully against "Westward," "Shamrock," "Nyria," "White Heather" and many modern vessels.

In new classes naturally smaller craft have been built since the War. The 92-ton cutter "Moon-Beam" (Fife), built in 1920, is a model of the new compact form. The new 12-metre class about 35 tons (20 tons displacement, 42 ft. LWL and 2,000 sq. ft. of sail) is the latest pattern of compact racing yacht, with good cabins for living and a paid crew limited to four men. The greatest sport internationally was from 1921-4 between Britain and America in a series of races called the British American Cup. W. Fife and F. J. Stephen were the chief British designers for this race which was for 6-metre class yachts. The British defeated the Americans in the 6-metre team racing. W. Fife has been the most successful designer. From 1921 to 1926 the most marked development in the design of sailing yachts has been the change from the gaff-mainsail rig to the triangular or Bermudian rig. No cutter-rigged yacht below 35 tons has been successful against a new vessel with a Bermudian sail.

(B H-S)

*United States.*—In America, since the War, the sport of yacht racing has increased materially. During these years the racing fleet has grown steadily in size, both on the Atlantic and on the Pacific coasts. It has developed especially in two divisions—that which includes the smaller yachts which may be raced by men of moderate means, and that which takes in the schooners which are a combination racing and cruising type. There is a constantly enlarging group of racing yachtsmen who are devotees of long-distance contests which bring into play not only a knowledge of sail handling but of navigation. These men own scores of staunch, seagoing vessels which are not in any sense of the word racing machines. This is a certain indication that the sport is developing along most durable lines. At what might be called the other extreme, the small boat classes are flourishing. As an example, the International Star Class is now the largest racing division in the world, numbering almost 400 boats. The Stars, on which it is said "the sun never sets," are only 22 ft. long overall, and 15½ ft. long on the waterline, but they have provided some of the keenest sport that has ever been seen in yacht racing and have done a great deal to popularise small boat competition. Each year, when the Star Class championships are held, the competitors come from the far ends of the earth to try for the International Trophy. In the old days, when races for the America's Cup were the great events of the yachting world; the conception became firmly fixed that yacht racing was a sport only for the wealthy. This has largely been lived down during the growth in recent years of the numerous small boat classes.

(S. LA.)

**YAKUB KHAN** (1849-1923), ex-Amir of Afghanistan (see 28.898), died at Dehra, United Provinces, Nov. 15 1923.

**YALE UNIVERSITY** (see 28.899).—In 1919 President Arthur T. Hadley announced his decision to resign the presidency of Yale at the close of the university year; and on June 22 1921 his successor, James Rowland Angell, was inaugurated. In 1920 the university underwent a thorough reorganisation in its administrative and educational system to meet modern conditions.

A school of nursing was established in 1923 through a gift from the Rockefeller Foundation. The course of 28 months leading to a degree or diploma includes public health and community work as well as hospital service. The Laura Spelman Rockefeller Memorial in 1924 granted a contribution for a period of five years for an Institute of Psychology. A group of specialists was in 1925 engaged in the study of fundamental problems of human and animal behaviour and in the training of personnel for the further pursuit of new studies in the field of teaching research and of practical applications.

**Developments.**—Many changes were effected in the curriculum; a new course of study in Yale College, designed to provide for substantial mastery of some one field of study, while giving reasonable assurance that no student will be graduated without an intelligent acquaintance with the major subdivisions of the modern world of arts, letters and science; in the Sheffield Scientific School changes were made with a view to increasing the flexibility of the course of study and to emphasising basic scientific and humanistic material as contrasted with purely technical specialisation; the schedules of work in administrative and chemical engineering were definitely crystallised, and through the gift of Mr. and Mrs. Louis J. Horowitz a new group of courses in building construction was offered in the department of civil engineering; changes in the requirements for degrees in the school of law were introduced as well as a summer session, designed for those who desire to pursue graduate law study and for those who wish to save an academic year in the completion of their course by attending three such sessions; a department of the drama was established in the School of the Fine Arts in 1924, funds for the department and for the erection of a University Theatre being provided by Edward S. Harkness (B.A., Yale, 1897); in the school of music the changes were designed to adapt the curriculum in a greater degree to the special talents and interest of the individual student; the curriculum of the school of forestry was broadened and liberalised and facilities for experimental and research work on a scale heretofore impossible were provided in Sage Hall, completed in 1923 (gift of William H. Sage, B.A., Yale, 1865); a chair in transportation was founded in the graduate school and named in honour of T. De Witt Cuyler (B.A., Yale, 1874); also the Dudley chair, Service of the railroads, established in 1923 by receipt of a bequest from Lucy B. Dudley, added to by bequest of Plimmon H. Dudley.

**Benefactions.**—Through the bequest of John W. Sterling (B.A., Yale, 1864) 14 professorships were established; two buildings were erected; the Sterling chemistry laboratory, which provides for instruction and research in every branch of chemistry, and the Sterling Hall of Medicine, which contains the administrative offices of the school, and teaching and laboratory facilities for the departments of anatomy, physiology, chemistry, psychology and pharmacology and toxicology; the Sterling scholarships established by a fund of \$1,000,000; and \$250,000 was received towards a total of \$1,000,000 for the Sterling Fellowship fund. At the same time the university's property holdings were augmented and several important buildings constructed, including the Osborn memorial laboratories, the Sloane physics laboratory, the Dunham laboratory of electrical engineering, the Mason laboratory of mechanical engineering, Sprague memorial hall (music), the Brady memorial laboratory (pathology), Artillery Hall and the Artillery armory, and the magnificent Memorial quadrangle, the gift of Mrs. Stephen V. Harkness, of New York City. The University Library, containing over 1,600,000 vol. and pamphlets, received many important accessions, notably the Edward M. House collection of historical papers and the Penniman Memorial Library of Education, besides numerous additions to collections previously announced. The new Peabody Museum, which is French Gothic in design, was formally dedicated on Dec. 29 1925.

A complete plan was announced in Jan. 1924, for the architectural development of the university during the next 100 years. This includes a new cross campus, designed to unify the Yale College campus and adjacent grounds, and the indication of sites for future buildings, which will tend to control the direction of growth of the university. Edwin McClellan Hall, a new dormitory, following closely in size and style Connecticut Hall (1752), was opened for Yale College students in Sept. 1925, and another dormitory under construction will be completed in the spring of 1926. The total university enrolment in the autumn of 1925 was 5,294, including 572 who were not candidates for degrees or certificates. The faculty numbered 575 and there were 428 assistants in instruction and administration. (J. R. A.)

**YAMAGATA, ARITOMO PRINCE** (1838–1922), Japanese soldier and statesman (see 28.902), died at Odawara Feb. 1 1922.

**YAP** (see 20.436).—This island of the Caroline group, formerly owned by Germany, is situated in the Pacific Ocean, south of Japan and east of the Philippines, and north of the equator, in latitude 9.35 north, longitude, 138.15 east. It has an estimated population of 7,155, almost entirely of Malay origin.

The importance of Yap arises from its cable connections, since it is a station on the direct line from the United States to the Dutch East Indies *via* Guam, while another cable runs from Yap to Shanghai. On May 7 1919, Japan was given a mandate over the islands north of the equator previously owned by Germany, including Yap. The U.S. Govt. protested, and asked for a reopening of the subject on the ground that at the Peace Conference it had reserved the right to object to exclusive control of the cable landings by Japan and taken the position that the island should be internationalised for cable purposes. Further, it was contended, the United States, not having ratified the Treaty of Versailles, was not bound. The supreme council of the Allies expressed its inability to reopen the matter. The controversy was finally disposed of at the Washington conference, Dec. 12 1921, by an agreement between the two Powers, wherein the United States recognised the Japanese mandate and Japan agreed that the United States should have free access to the island on a footing of entire equality with Japan or any other nation in respect to the Yap-Guam cable and any other cables which might be laid by the United States or its nationals, and also similar rights and privileges in regard to radio-telegraphic service. The United States was also granted free entry and exit for persons and property. The U.S. Senate ratified the convention embodying this agreement March 1 1922. (See WASHINGTON CONFERENCE.)

**YARMOUTH**, England (see 28.905), the largest herring fishery port, with numerous curing and brewing establishments, had a population of 60,700 in 1921 (39,724 in Yarmouth, 20,391 in Gorleston and 585 in Runham Vauxhall), and an area of 3,598 acres. A comprehensive town plan has been prepared. The parish of Southtown was formed from that of Gorleston in 1911. The esplanade has been extended one-fourth of a mile northwards, and the North Denes estate of 46 ac. was in process of development in 1925. The pavilion on the Britannia pier was burnt down in 1910, but has been rebuilt to seat 1,400, and a large bathing-pool was opened in 1922. An art school was opened in 1913. The East Anglian school for blind and deaf children was opened at Gorleston in 1911, and Melton Lodge, on the Marine Parade, as a home for ex-service men's children in 1921; a children's ward was added to the general hospital as a memorial to King Edward VII., and in 1921 a war memorial monolith was erected in St. George's Park.

In 1912 the powers of the Port and Haven Commissioners over the water area of the harbour, and of the corporation over the wharves were transferred to an enlarged harbour commission. Since then the quays have been extended. There is a new trawl market to the north of the fish wharf, with offices. An export quay, 750 ft. long, has been built to the south of the Trinity magazine, making a total of 23,400 ft. of quayside in the port.

**YEATS, WILLIAM BUTLER** (1865– ), Irish author (see 28.909). In 1907 was published vol. 5 of plays for an Irish theatre, containing *Deirdre*. In 1907 *Discoveries*, a volume of essays, appeared. In 1908 appeared a verse play, *The Golden Helmet*, *Poetry and Ireland*, (essays by Yeats and Lionel Johnson) and *The Unicorn from the Stars and other plays* by Yeats and Lady Gregory. *The Green Helmet*, and other poems were published in 1910, and in 1911, *Synge and the Ireland of His Time*; in 1912 *The Cutting of an Agate* (essays); in 1913 *Poems written in Discouragement*; in 1914 a volume of poems, *Responsibilities*; and in 1915 a prose book, *Reveries over Childhood and Youth*. In 1916 a poem, *Easter 1916* appeared and also *Eight Poems*; 1917, *The Wild Swans at Coole*, other verses and a play in verse; 1918, *Nine Poems and Per Amica Silentia Lunae*, (essays); 1919, *Two Plays for Dancers*; 1920 *Michael Robartes and the Dancer*; 1921 *Four Plays for Dancers* and a prose book *Four Years*; 1922, *Later Poems*, and in the same year *The Player Queen*, *Plays in Prose and Verse*, *Seven Poems and a Fragment*,

and *The Trembling of the Veil* (prose). *The Cat and the Moon* (a play and poems) was published in 1924.

The early poetry of Yeats showed traces of the influence of Shelley, William Morris and Sir Samuel Ferguson, but even through this influence a very original imagination was already apparent. He became more fully himself in *The Wanderings of Oisín* (1889), and in *The Wind Among the Reeds* (1899), all early influences had finally vanished. In this he appears the self-conscious and fastidious artist, and so remains. The later verse is more intellectual and in contrast to the richly coloured poetry of his youth there is in it a finer sense of the beauty to be revealed by bare words. Mr. Yeats is the pivot around which Anglo-Irish literature has turned from crudity and a rather facile energy to subtlety and self-conscious art. He was awarded the Nobel Prize for literature in 1924. (S. L. M.)

**YELLOW FEVER** (see 28.910c).—The dreaded "vomito negro" which for four centuries claimed more than 50% mortality among its victims, has been relegated to a place of secondary importance since the institution, in 1901, of the anti-mosquito campaign. Between 1910 and 1925 no epidemic invasion of yellow fever into temperate regions occurred, and some of the most noted endemic centres in Ecuador, Mexico and Brazil have been freed of the disease, probably forever; no case has been reported in the entire Western Hemisphere for many months. The use of oil for destroying mosquito larvae has now been practically abandoned in favour of placing in the tanks which serve as water supply for houses in the tropics one or two small fish, which eagerly devour the "wrigglers."

Connor, in Guayaquil, first used this method successfully in 1919, and it has since been used in other countries with excellent results. The fish must be of small size and able to withstand handling and transportation. Those chiefly used are the minnows, *Gambusia affinis*, *Dormitator latifrons* and *Fundulus heteroclitus* and the common "lefa" of South America (*Pygidium piurac* C.) some being top-feeding and others bottom-feeding fish.

*Isolation of the Causative Micro-organism of Yellow Fever and Preparation of a Prophylactic Vaccine and a Curative Serum.*—While the transmitter of the yellow-fever germ had been experimentally proven, by the American Army Board under Reed, to be the mosquito, *Aedes aegypti* (formerly known as *Siegmomyia fasciata* or *S. calopus*), the microbe which produced the disease, had remained unknown until 1918 when a minute spiral organism, subsequently named *Leptospira icteroides*, was isolated from the blood and organs of yellow fever patients, in Guayaquil, Ecuador. Inoculation of cultures of this organism reproduced all the characteristic symptoms and lesions of yellow fever in guinea pigs, marmosets and young puppies. Yellow fever was also transmitted directly to guinea pigs with blood taken from yellow-fever patients and the same micro-organism from experimentally infected animals. Investigations previously conducted by the American Army Board in Havana had demonstrated that the germ of yellow-fever could pass through the pores of certain bacteria-proof filters (see FILTER-PASSING MICROBES), and this fact alone had been sufficient to disprove the relation to yellow fever of a dozen or more different bacteria. *Leptospira icteroides*, on the other hand, proved to be a filter-passer and to conform with other well-known characteristics of the yellow-fever virus: thermal death-point; transmissibility by *Aedes aegypti*; ability to produce typical fever, extensive haemorrhages into the gastro-intestinal tract, resulting in the "black vomitus" and melaena, severe nephritis, general jaundice and the characteristic changes of liver and kidney (fatty degeneration and necrosis). Another important proof that connects *Leptospira icteroides* with yellow fever is that this micro-organism is killed by the blood serum of persons who have just recovered from yellow fever but not by that of healthy persons or persons recovering from other diseases.

*Leptospira icteroides* was subsequently isolated from cases of yellow fever in Mexico, Peru and Brazil. It is actively motile, measures 4-9 $\mu$  long and 0.2 $\mu$  wide and there are two spirals for each micron. The ordinary microscope does not

reveal its presence in the living condition, but it is easily seen by means of dark-ground illumination. It grows only on special culture media. The isolation of *Leptospira icteroides* has made it possible to prepare a preventive vaccine, similar in type to that in use for protection against typhoid fever, and a curative serum. While a given locality may be freed from yellow fever by destruction of mosquito larvae, this type of preventive work requires some months. Newcomers meantime are in danger, and protection, even of a temporary nature, is welcome. Injection of a small quantity of killed cultures of *Leptospira icteroides*, as first shown in experimental animals, confers temporary protection from the yellow-fever infection, the inoculation taking effect within about two weeks. The results of prophylactic inoculation of 20,000 or more individuals since 1919 indicate that if persons are satisfactorily vaccinated they are protected against yellow fever for about six months. The curative serum has been tried in 237 cases. When it has been used early in the disease, i.e., before the fourth day of illness, the death-rate has been comparatively small (16% as compared with the usual 50% or more in yellow fever). It is without appreciable benefit when given later in the illness, when the micro-organisms have done irreparable injury to the liver and kidneys.

**YELLOW RIVER:** see HWANG HO.

**YOKOHAMA** (see 28.921), the chief port of Japan, with a population of 422,942 in 1920, was practically destroyed by an earthquake in Sept. 1923. Many thousands of its inhabitants were killed, some 60% of the houses were burnt and about 19% collapsed. Temporary barracks and tents were used at first to house the surviving population. The electric light and water systems and the tramways were restored very promptly, but in the reconstruction Yokohama was far behind Tokio in 1925, owing largely to the fact that it had a much bigger foreign element and was much more western in construction. The debris of these solid erections was more difficult to remove, and their replacement slower and costlier than that of the Japanese type of buildings.

The starting-point of reconstruction was the new railway station on the coast, and it is proposed to widen 25 m. of existing streets and to build 20 m. of new streets; but in 1924-5 there remained many acres of ruins, the Bluff was still bare, and there were only temporary buildings, mostly dwelling-houses, on the Bund. Railways had been restored, and a plan for their further reconstruction was in hand. A memorial hall was opened in 1925. In 1924 shipping and industry were gradually approaching normal conditions and trade, especially in raw silk, exceeded expectations. Shipbuilding, however, had not recovered. Considerable improvements in the dock accommodation, wharves and equipment of the harbour had been effected before 1923, but during the earthquake about a mile of the breakwater sank 8 ft. and most of the wharves were destroyed. The repair of the docks and harbour was undertaken by the central government, and was practically complete in 1924. Two-thirds of the original warehouse accommodation was then available, and the space for open storage had been doubled.

**YORK, ALBERT FREDERICK ARTHUR GEORGE, DUKE OF** (1895- ), second son of King George V. and Queen Mary, was born at York Cottage, Sandringham, Dec. 14 1895. After passing through Osborne and the Royal Naval College, Dartmouth, he was gazetted midshipman in Sept. 1913. Though debarred by ill health from active service during the early years of the World War, he served in the battle of Jutland as a sub-lieutenant, being mentioned in despatches. At the end of 1917 he was attached to the naval branch of the Royal Air Force and, in Oct. 1918, was on the Western Front, qualified as a pilot and eventually became wing-commander in 1920. After the War (Oct. 1919) he entered Trinity College, Cambridge, taking an abridged course in history, economics and civics. He has since shown a special interest

in industrial questions, becoming President of the Society for Industrial Welfare. He was created Duke of York in June 1920 and K.T. on the occasion of his marriage to Lady Elizabeth Bowes-Lyon, April 26 1923, having been previously (Dec. 1916) created K.G. In 1922 and 1923 the Duke represented the King at court ceremonies in Rumania, Serbia and Czechoslovakia. In 1925 he was made president of the British Empire Exhibition, Wembley, and in June was appointed to the Privy Council. On April 21 1926 a daughter was born to the Duke and Duchess of York. The Princess Elizabeth, as she is called, is, after the Prince of Wales and her father, the heir to the British throne.

**YOSHIHITO** (1879- ), 122nd Emperor of Japan, third son of the Emperor Meiji (Mutsuhito), was born at Tokyo on Aug. 31 1879. On the eighth anniversary of his birthday the Prince was proclaimed heir-apparent, the first and second sons of the Emperor Meiji having died in infancy. In Sept. 1887 the Prince commenced attending the Peers' School, and on Nov. 3 1889 he was declared imperial crown prince. Two years later he left the school to continue his studies under private tutors. In 1897 he took his seat, in accordance with prescriptive right, in the house of peers. On May 10 1900 the crown prince married Sadako, fourth daughter of the late Prince Michitaka Kujo, and on April 29 1901 a son, Hirohito, was born, followed by a second son Prince Yasuhito Chichibunomiya, on June 25 1902, and a third, Prince Nobuhito Takamatsunomiya, on Jan. 3 1905. On July 30 1912 on the demise of his father, the crown prince ascended the throne; but owing to the national mourning the formal ceremony of enthronement did not take place until Nov. 1914. In the following year a fourth son, Prince Takahito Suminomiya, was born on Dec. 2. Owing to the indifferent health of the Emperor, Crown Prince Hirohito became prince regent on Nov. 25 1921.

**YOSHIZAWA, KENKICHI** (1874- ), Japanese diplomat, born in Niigata-Ken. He had literary tastes as a student and studied English literature for his degree in the Imperial University of Tokyo. He later turned his attention to diplomacy, and he had his first experience, as *Élève-Consul* at Amoy, South China. After spending two years in Shanghai and in London he returned to the Foreign Office in Tokyo, and was sent as Secretary to the Legation in Peking. This office he held until, in 1919 he became director of the Asiatic Bureau, where his experience of Far-Eastern people enabled him to adjust differences between his own country and other Oriental Powers. He retained this post until 1923, and was again in Peking in an official capacity when the new Russo-Japanese Alliance was broached in 1924. Many Japanese fought against the proposed alliance, thinking it unwise to link their country with Soviet Russia, but Mr. Yoshizawa believed that this bond between the two countries could bring nothing but good and worked to that end. It is said that the strain of innumerable conferences and discussions undermined Yoshizawa's health. When, in January of 1925, the treaty was made mutually agreeable, it was signed by the representatives of the two Powers grouped round the Japanese Minister's bed. He was made ambassador in the same year.

**YOUNG, MAHONRI MACKINTOSH** (1877- ), American sculptor, painter and etcher, was born at Salt Lake City, Utah, Aug. 9 1877. He studied with J. T. Harwood, Salt Lake City, at the Art Students' League, New York City, and at the Julien and other Academies in Paris. After his return to the United States he became instructor in drawing at the Art Students' League and later instructor in sculpture at the American School of Sculpture. His works are characterised by simplicity, dignity and breadth of conception, united with exquisite workmanship. He is known chiefly through his statuettes, figures of labourers and cowboys, which exhibit close observation of nature and virile form. Among his best known works are "Man with Pick" in the Metropolitan Museum of Art; the Hopi and Apache groups in the Museum of Natural History, New York City; "A Labourer" and "The Rigger" in the Free Public Library, Newark, N. J.; the "Sea-Gull" monument in Salt Lake

City; "Rolling His Own"; and "Monument to the Dead" (with Bertram Goodhue), in Paris.

**YOUNG, OWEN D.** (1874- ), American lawyer and business man, was born at Van Hornesville, N. Y., Oct. 27 1874. He was educated at St. Lawrence University, N. Y., (A.B., 1894), and Boston University (LL.B., 1896). He commenced the practice of law in Boston, 1896, being associated with and later a partner of Charles H. Tyler until 1912, when he retired in order to become general counsel for the General Electric Company. In 1913 he was elected vice-president in charge of policy and in 1922 was elected chairman of the Board of Directors. He organised and became chairman of the Board of the Radio Corporation of America. He was also a director of the Federal Reserve Bank of New York, General Motors Corp., the International General Electric Co., and chairman of the American Section of the International Chamber of Commerce. He was a member of President Wilson's second industrial conference, chairman of the Committee on Business Cycles and Unemployment appointed by President Harding, and chairman of the American Group, International Court of Arbitration of Trade Disputes of the International Chamber of Commerce. In December 1923, he accepted the invitation of the Reparations Commission to act as a member of the first committee of experts charged with the enquiry into the balancing of the German Budget and the stabilising of the German currency. Their ensuing report was accepted by the commission, Sept. 1. (See REPARATIONS.) He was appointed agent-general for Reparation payments *ad interim* on that date, holding the position till Oct. 31, when he resigned and was succeeded by S. Parker Gilbert.

**YOUNGSTOWN, Ohio, U. S. A.** (see 28.941), the centre of a district which produces one-twentieth of the world's output of steel, extended its boundaries from 6,606.8 ac. in 1910 to 16,224 by 1923. The population increased 67.4% in the 10 years after 1910 to 132,358 in 1920, of whom 6,662 were negroes (an increase of 244%) and 33,945 were foreign born; and was estimated at 159,970 in 1925 (census bureau). The output of factories within the city was valued at \$81,271,000 in 1909; \$241,458,000 in 1919; \$272,183,553 in 1923. The character of the dominating industries is reflected in the preponderance of men in the population (114.9 males to 100 females, 1920) and in the small number of women employed (18.5% of all 10 years of age and over, the smallest proportion in any of the large cities in 1920). Natural gas from Ohio and West Virginia is used for domestic fuel. Improvements (to 1925) included a belt-line railway, a service-at-cost franchise for the transit system, zoning ordinances, new school buildings, parks and playgrounds, a golf course, the Butler Art Institute and the Stambaugh Memorial Auditorium. A new charter, effective Jan. 1 1925, provided for non-partisan ballots, the recall of elected officers, the initiative and referendum and a budget system.

**YPRES, JOHN DENTON PINKSTONE FRENCH, 1ST EARL OF**, (1852-1925), British soldier, was born at Ripple, Kent, Sept. 28 1852. The son of a naval officer, he entered the royal navy, in which he served as cadet and midshipman from 1866 to 1870. Joining the militia he passed from this into the army in 1874 and was gazetted to the 19th Hussars. He married Eleanor, daughter of R. W. Selby Lowndes in 1880. He served in the Nile expedition in 1884-5, and commanded his regiment from 1889 to 1893. After two years on the War Office staff he commanded a cavalry brigade from 1897 to 1899, and on the mobilisation of the expeditionary force for S. Africa in the latter year he was chosen to command the Cavalry Division and was promoted major-general. Pending the assembly of this he served in Natal where he commanded the troops on the field at Elandslaagte and took part in the early combats near Ladysmith, but he proceeded to Cape Colony just before the place was invested. After a few weeks in charge of the force at Colesburg, he led the cavalry during Lord Robert's advance from Cape Colony, relieved Kimberley, cut off the retreat of Cronje's army, and occupied Bloemfontein. During the subsequent advance into the Transvaal he was in command of the left wing, and at a later stage of the victorious campaign he played a prominent

part in the move from Pretoria to Komati Poort. For these services he was given the K.C.B. During most of the second phase of the struggle he was in command of the forces operating against the enemy in Cape Colony, and he was on the conclusion of hostilities promoted lieutenant-general and was given the K.C.M.G.

He commanded at Aldershot from 1902 to 1907, in which year he was promoted general, and he then became inspector-general of the Forces for five years. He was appointed chief of the Imperial General Staff in 1912 and was promoted field-marshal in 1913. In April 1914 he vacated the post of C.I.G.S., owing to military troubles in Ireland in connection with Ulster, but four months later he was chosen to take charge of the Expeditionary Force on the outbreak of the World War, and he commanded the British Army on the Western Front from the outset of the struggle until the end of 1915. He resigned in December of that year, Sir D. Haig taking his place, and he returned to England, to be raised to the peerage as Viscount French of Ypres and High Lake in recognition of his great services. He then became commander-in-chief in the United Kingdom, and he held that appointment until May 1918, when he was selected to be lord lieutenant of Ireland. This position he occupied under most trying conditions until early in 1921. On resigning he was rewarded with an earldom. He died May 22 1925 at Deal Castle, Kent. At the end of the war, Lord French published his personal narrative under the title, "1914."

**YPRES, BELGIUM** (see 28,941), for four years the centre of the Ypres salient, never more than seven and sometimes less than three miles from the front line, suffered greatly during the World War. The town was deliberately wrecked, and was a blazing furnace for three days in 1915. Nothing remained after the Armistice but cellars and foundations, excepting fragmentary ruins of the Cloth Hall and St. Martin's church. The town was awarded the British Military Cross and the French Croix de Guerre in 1920.

Ypres is now again a beautiful town, with a population estimated at 14,000 in 1924. First temporary hostels, garages, etc., were built outside the Menin Gate, the ruins were cleared, and the materials found were classified. Then the rebuilding of the streets on the old lines, with houses of the original picturesque designs, was pushed rapidly forward. Work was begun at once on the cathedral, the churches of St. Martin, St. Peter and St. James, the Templars' House, the Châtellerie (now used as the town hall), the Belle Hospital and the Boucherie. The reconstruction of the Cloth Hall and the building of a palais de justice were started in 1924. A hospital has been built outside the town in place of the old one in the Grande Place, and the working class district has been replaced by the garden city of Kalfvaart, between the roads to Bruges and Zonnebeke. The station square has been laid out with lawns and flower beds, and only the battered ramparts remain to show what Ypres suffered. The Menin Gate has been rebuilt as a memorial to missing British soldiers, with a fine triple arch and a Hall of Memory in the centre. There are 40 cemeteries within two miles of the town.

**YPRES, FIRST BATTLE OF.**—While the operations which preceded the battle of the Yser were in progress (see YSER, BATTLE OF THE), the British I. Corps arrived in Flanders. On Oct. 19 it was ordered to Ypres, Sir John French still hoping to push back and outflank the German right. The full strength of the Germans had not yet been disclosed and the opinion at British headquarters was that there were not more than 3½ German corps north of the Lys; actually there were 5½.

*First Phase of the Battle.*—The I. Corps advanced with the expectation of attacking the enemy and it was not until the 21st, when it had taken up position on the left of Rawlinson's command between the Ypres-Roulers railway and Bixchoote and had repulsed a great attack by the German XXIII. and XXVI. Res. Corps upon Langemarck, that the true facts became known and Sir John French issued orders that positions were to be entrenched and held defensively. It had become a question of saving the Channel ports, not of outflanking the enemy.

Joffre, informed of the situation, had informed Sir John French that he was sending his IX. Corps at once to Ypres. The arrival of this corps enabled Gen. d'Urbal to take over the front from the Roulers railway to Bixchoote and enable Haig to place his 1st Div. in reserve. D'Urbal hoped to take advantage of the repulse of the Germans at Langemarck and ordered an attack for the 24th, but at this period the opposing forces were approximately equal and neither side had sufficient strength to force the other back. The effort of the French IX. Corps, therefore, yielded but small results, and so the first phase of the first battle of Ypres ended with the French holding the northern and the British the southern half of a semi-circle around Ypres, the apex of the semi-circle and the dividing line between the French and British being near Broodseinde.

*Preparations for Renewed Action.*—During the next few days there was a comparative lull, of which Haig took advantage to

re-organise his front. The 7th Div., weakened by prolonged fighting, was placed under his orders, Rawlinson leaving the battle front to await other employment; the front of that division was shortened and part of the 1st Div. went again into the line between it and the 2nd Division. The attempt of Duke Albrecht's army to break through had been foiled but the Germans were not yet at the end of their resources. Falkenhayn had formed a new army group composed of the II. Bavarian Corps, the XV. Corps, the 6th Bavarian Res. Div. and the 26th Div. behind Von Marwitz's cavalry, which had been engaged with the British cavalry corps and the left of the British III. Corps on the Messines ridge.

This group under Von Fabeck was with the help of Von der Marwitz's six cavalry divisions to drive in the British front between the Lys and the Menin road. This was to be continued with a new attempt on the Yser front before the rise of the floods had made attack impossible. The attack on the Yser front began on Oct. 30 and the Germans breaking through the front of the 2nd Belgian Div. captured Ramskapelle. The situation was critical but was restored by a counter-attack, ordered by Gen. Grossetti, the commander of the 42nd Div. which took the French and Belgians again into Ramskapelle and repaired the gap. The rising water prevented the Germans from re-
